3. The ſcorbutick dyſcraſie of the Blood ſhould be mended by Phlebotomy and ſpecifick Remedies: Wherefore that the whole buſineſs of the preſervatory indication may

PHAR. Part. II.

may be reduced to one point, the Remedies which perform its chief intentions are Catharticks, Blood-letting, Digeſtives, opening Medicines, Diaphoreticks, Diureticks, and Anti-ſcorbuticks or Specificks. Then, for that indeed Digeſtive and opening Medicines are imbued, either of them with acid, biting, or ſaline Particles, they more often overcome; beſides, for that Medicines of this ſort move conveniently enough by Sweat or by Urine, therefore the Curatory proviſion requiſite to the aforeſaid intentions, may be yet reduced to ſtraiter limits; to wit, that it may almoſt only conſiſt in Cathartick, Digeſtive, and Anti-ſcorbutick Medicines, to which Phlebotomy may be added as occaſion ſerves: It now is my part to deſign ſome forms and preſcripts of them, and alſo the manner of uſing them.

Purging.

Purging.

1. The method preſcribed for the Curing almoſt of all ſcorbutical perſons, begins with Purging Medicines; for unleſs the firſt paſſages are made clean, Medicines deſigned for any other uſe are infected by their filths: wherefore Vomiting ſometimes is no leſs convenient than Purging.

By Vomit. If the Ventricle (as it is often wont to be) is grieved with a viſcid, ſouring, and unſavory matter, and endeavours to caſt out the impure Load, by a nauſeating and ſtriving to vomit, and if the Patient is wont to bear ſuch an evacuation ſtrongly enough and with eaſe, there is no hindrance, ſo that their ſtrength be not too much decayed, but that an emetick Medicine may be adminiſtred: For the more ſtrong, let them take an infuſion of *Crocus Metallorum* or *Mercurius Vitæ*, or the *tartarous Emetick* of *Mynſichtus*, or *Glauber*'s *Sulphur* of *Antimony*: Thoſe who are of a more thin and weak Conſtitution, let them take *Wine* of *Squills*, or the *Gilla* of *Theophraſtus*: Let thoſe who take but a ſmall doſe, drink after it good ſtore of Poſſet drink, till the Ventricle being full to nauſeouſneſs, Vomiting may be the more eaſily provoked, by ones Fingers or a Feather thruſt down the Throat, which may be reiterated as often as they pleaſe. By this way of Vomiting the mere Contents of the Stomach being wiped from its foldings are ſent forth; neither are there ſtirred up in any other of the *Viſcera* about it, or in the Membranes (as it is wont to happen from Stybiates or Antimonial Emeticks) painful haulings or Convulſive, with ſwooning or fainting away. To thoſe whoſe Ventricle, by reaſon of evil digeſtion, eaſily gathers together a load of Phlegm or other degenerous matter, I have preſcribed (and often with good ſucceſs) ſuch a Vomiting once a month, which they have found ſafe and wholeſome.

By Stool. Where there is no need of Vomiting begin by a Purge, at leaſt let there be ſome days between this and the other evacuation if this follows. I judge what in times paſt has been inculcated, by Authors, concerning the preparation of the humours, to be either needleſs, or the circulation of the Blood not underſtood, to be altogether erroneous: But in the place of that intention are ſubſtituted things reſtoring the Ferment of the *Viſcera*, and things altering the *Craſis* of the Blood: In the mean time, that the filth of the firſt Paſſages and the recrementitious ſuperfluities both of the Blood and alſo of the nervous Liquor may be ſent forth; in the firſt place a light and gentle Purge is ordered and afterwards once a week it may be either oftner or ſeldomer repeated according to the ſtrength of the Patient, and the ſtrength of the Medicine may be proportionated according to the ſucceſs of the firſt Doſe. To this end Pills, Potions, Apozems, Electuaries, Powders, and many other forms of Medicines are wont to be preſcribed.

Remedies made known in a more hot Scurvy. If the Conſtitution of the ſick be more hot, and that the Scurvy ſeems to be founded in an aduſt Diſcraſie of the Blood, *viz.* a Sulphureous-Saline, all Aloetick, and Diagrydiat Purges are to be ſhunned, and only the more temperate made out of Senna, Rhubarb, and others which do not too much agitate the Blood and Humours, are to be adminiſtred.

Pills. Take of the leaves of Senna ℥j, of Rhubarb ʒvj, of Epithymum ʒiij, Roots of Polypodium of the Oak, of Engliſh or Monks Rhubarb dryed, of each ℥iß, of yellow Sanders ʒij, of Celtick Spike ʒiß, of the Salt of Wormwood ʒij, being cut and bruiſed, let them be digeſted in a Glaſs, in hot Sand, with white Wine and Fumitory Water, of each a Pint (or a Quart of our Magiſterial antiſcorbutick Water) for two dayes the Colature being clear, let it be evaporated in the gentle heat of a Bath, to the conſiſtence of Hony, then add to it of the Powder of the leaves of Senna, and of Rhubarb, of each ʒj, of the Cream of Tartar ʒiiß, make a Maſs for Pills. The Doſe from ʒiß to ʒj.

Syrup. Or prepare the ſame infuſion, which being evaporated by a gentle heat, to the conſiſtency of a Syrup by adding at the end, of cleanſed Manna and white Sugar, of each ℥ij, make a Syrup. The Doſe from j to ij ſpoonfuls in a convenient Vehicle.

Or

Or of the Tincture of the ſame may be given ℥iiij or vj for a Doſe, by adding of the Cream of Tartar 3ß, and if there be need of Sweating, of the Syrup of Pippins ℥iij. PHAR. Part II.

Or put to the preſcribed Tincture of Corinthian Grapes, cleanſed ℥vj, let them be digeſted hot till the Grapes Swell, which being taken forth, evaporate the Liquor to the Conſiſtence of a Syrup, adding to it of Sugar and cleanſed manna, of each ℥iß, then the Grapes being laſtly put into it, let the Medicine be kept in a glaſs Veſſel, cloſe ſtopped. The Doſe from one ſpoonful to two. *Tincture. Of Raiſins.*

Or add to the aforeſaid Tincture, being evaporated to the half part, of freſh Caſſia, and of the Pulp of Tamarinds, extracted with antiſcorbutick Water, of each ℥iij, of the Conſerves of Violets, of Damask Roſes each ℥ij, of the Powder of Senna, of the greater Compoſition 3j, of the Powder of Rhubarb ℥ß, of Cream of Tartar, of the Species of Diatrion Santalon, each 3ij, let them be bruiſed together in a Stone Morter, till they are reduced to the form of an Electuary. The Doſe about the bigneſs of a Walnut more or leſs, according to the ſucceſs of the Operation. *Electuary.*

For thoſe whoſe Stomachs being full of loathing and will not admit of the Medicines, but in a ſmall quantity and elegant form: Take of the Reſine of Scammony *gr.* iiij to viij, of the Cream of Tartar ℈ß, of Celtick Spike *gr.* vj, mingle them and make a Powder, let it be given in a ſpoonful of Gruel, or in the form of Pills. *Powder.*

Thoſe who labour with the ſcorbutick Indiſpoſition, and are of a more frigid and cold conſtitution, and where the Diſeaſe ſeems to be founded in a Nitro-Sulphureous diſpoſition of the Blood, like to ropy Wine, are to have adminiſtred to them more ſharp Catharticks endued with more hot Particles. *Purges in a more cold Scurvy.*

Take of Stomach Pills with the Gumms 3ij, of the Reſine of Jalap *gr.* 20, Vitriolat Tartar *gr.* 16, Oyl of Juniper ℈ß, with as much as will ſuffice of Ammoniacum, ſoluted in the Water of Earth-worms, make Pills 16, take 4 at a time once in 7 days. *Pills.*

Take of Pilulæ Tartar of *Bontius* ℥iß, of the reſine of Jalap *gr.* 12, of the ſalt of Tartar ℈ß, with what will ſuffice of Auguſtan Syrup, make Pills, 12.

Take of the Extract of Pil. Ruffi 3j, of the Extract of black Hellebore 3j, of the Salt of Tartar ʒß, with what will ſuffice of Ammoniack ſolute, make 9 Pills to be taken, 3 for a doſe. *Extract and Syrup.*

Take of the Leaves of Senna ℥j, of Rhubarb ℥vj, of Mechoachan, Turbith with Gums, of each ℥ß, of the Strings of Hellebore black ℥iij, of the Salt of Tartar ℥ij, of yellow Sanders ℥ß, of Winteran Bark ʒij, being ſliced and bruiſed let them be digeſted in a Quart of Whitewine for two days, let it be ſtrained without preſſing it, and take of it by it ſelf, from ℥v to ℥vi, either in the extract or reduced to a Syrup, or electuary as the Tincture above deſcribed, but adding of as much as will ſuffice of the Powder of Arthritice, or of Diaſena.

Or, there is prepared a Tincture of this ſort, which may be given to ſtrong men, from half a Spoonful to a Spoonful. Take of Salt of Tartar ℥j, of the ſmaller Spirits of Wine lbjß, let them digeſt till it becomes Yellow: to this being poured off from its Fæces, put of the Leaves of black Hellebore macerated in Vinegar ℥j, of yellow Sanders ʒj, the yellow part of Orange ʒiß, let them digeſt being cloſe ſhut up and warm for 3 days. The matter being Strained clear, let it be diſtilled in Balneo to the half part, the remaining Liquor keep for Uſe. *Tincture.*

Take of ſharp-pointed Docks, of Polypodium of the Oak, ſtinking Nettles, and of Chervil, of each ℥vj, of the Leaves of Eupatorium and Betony, each j handful, of White Sanders and of Yellow, each ℥iß, [illegible] or baſtard Saffron ℥j, of the Tartar of White-Wine ℥ß, boyl them in three Pints of Spring Water, or lbijß, till half is conſumed, add to it of Rheniſh-Wine lbj, and preſently let it be ſtrained, to which put of the beſt Senna ℥ß, the Yellow Rind of the Orange ℥ij, Rhubarb ℥vj, of the Leaves of Black Hellebore ℥ß, infuſe them being warm and cloſe ſhut for 12 Hours, being ſtrained, let it be kept in a Glaſs cloſe ſtopped. The Doſe is ℥v to vj. *Apozeme.*

We might here add many other forms of Purges, but there is no great need of variety in theſe: of the aforeſaid, either theſe or thoſe which ſhall be thought moſt convenient, let them be adminiſtred, and every 5 or 6 days as occaſion ſhall require iterated. Too often and violent purging, deſtroys the ſtrength and very much waſts the force of the *Viſcera*, and in the mean time takes not away the Diſeaſe.

After a Purge or two, if there be any need of taking away Blood, let it be done either by Phlebotomy in the Arms, or by Leeches in the Veins of the Fundament. It is not much matter which Vein is Cut: nor is there ſo much benefit in the opening the Salvatella, as hath been commonly thought. The great ado among Authors, who were ignorant of the Circulation of the Blood, about opening the Cephalick, or the Liver Vein, or any other chiefly in the Scurvy comes to nothing. Phlebotomy is indicated *Phlebotomy.*

PHAR. Part. II.

by the plentifulneſs and Vitiouſneſs of the Blood, which rather ought to be performed by taking away a ſmall quantity often, than a great deal all at once: For when the bloody Liquor becomes very impure, it is not more certainly mended by any kind of Remedies, than by letting it forth often and ſparingly. For as often as the old corrupted Blood is let forth, freſh, better and more pure ſucceeds. In the mean time there is need of Caution, leſt too great quantity be taken away at once, for its ſtock being diminiſhed together, Sanguification grows weak, and for that reaſon a Dropſie, or a Cachexia, or evil diſpoſition of the whole Body follows.

After Purging, and (if need be) Phlebotomy, many other kinds of Remedies, no leſs neceſſary, are required in the Scurvy: In the preſcribing of which in order, we ought preſently to conſider whether the Indications being only Preſervatory they may have place here, or ought not to be deferred to thoſe which are contrary, to wit, thoſe which reſpect the more grievous Symptoms: But if you endeavour the whole buſineſs of the Cure againſt the cauſe of this Diſeaſe, proceed according to the following method: It ſhall be ſhown hereafter what ſort of Cure is to be adminiſtred, (if perchance occaſion requires) to the Symptoms.

Therefore if the buſineſs of Medicine be chiefly deſigned againſt the cauſe of the Scurvy, and that it may be firſt eradicated by it ſelf, for this end, as we ſhewed but now, there are moreover to be made uſe of at all times except on the days of purgation, Digeſtive and Specifick, or antiſcorbutick Remedies: to which ſometimes if need be, may be added Diaphoreticks, or Diureticks, or Medicines operating by Sweat or Urine. The forms of Medicines, for the performing theſe kind of Intentions, and manifold preſcriptions, and of various kinds, are every where extant among Authors. It pleaſes me however, to place here ſome of the more ſelect, which I think good to diſtinguiſh into two Claſſes, according to the twofold nature of the Scurvy, to wit, the ſulphureous Saline, and Saline Sulphureous. And in the firſt place we will deliver what is convenient in the latter Diſtemper, to wit, where there is need of Medicines, indued with a certain Incitation, and very much filled with a volatile Salt.

Digeſtives. Digeſtive Remedies, which reſtore the Ferment of the Ventricle, and help its Function, and alſo of the other *Viſcera* ſerving to the Chyle; and Antiſcorbutick or Specifick, which take away the Dyſcraſie of the Blood, are either joyned in the ſame Compoſition, or at leaſt they are to be taken ſucceſſively the ſame day.

Among the Digeſtive Medicines, are deſervedly ranked, Cream of Tartar, Cryſtal Salt, and Tincture of Cryſtal, Vitriolate and Chalybeate Tartar, Elixir *Proprietatis*, ſimple Mixture: The uſe of every one of theſe given twice aday, does oftentimes prove beneficial.

Beſides you may eaſily make with the two following *Menſtruums* magiſterial Tinctures and Elixirs of divers kinds and digeſtives, appropriate to the Scurvy.

Take of the Spirit of Vitriol rectified ℥vj, of the Spirit of Wine Alcholiſated ℥xvj, mix them and diſtil them in a Glaſs Retort, with three Cohobations: Keep it for uſe in a Glaſs very well ſtopped. The Elixir *Proprietatis*, is better and more eaſily prepared with this compounded *Menſtruum*, than the ordinary way.

Take of Winteran Bark, of *Lignum* Aloes, of the Roots of the leſſer Galangal, each ʒij, of Cinnamon, Cloves, Cubebs each ʒj, *Ameos* or Biſhops Weed and Naſturtium Seeds, each ʒß, being bruiſed, pour on them the aforeſaid *Menſtruum* till it be 3 Fingers breadth above them, let them digeſt in a Veſſel, in a Sand Furnace for 6 days. Strain it and keep in a Glaſs cloſe ſtopped. The doſe 20 drops, more or leſs in a ſpoonful of Canary Wine or proper Water. Let it be given twice a day.

Take of the whiteſt Amber, of Gum Hedera, Caranna, Tacamahaca, each ʒj, of Saffron ʒſs, of Cloves, Nutmeggs, each ʒij, bruiſe them and pour on them the aforeſaid *Menſtruum*, and as before draw forth a Tincture. The doſe 20 drops as before.

Take of the Salt of blew Tartar iiij, let them digeſt with lbj of the Spirit of Alcholiſate Wine to the Extraction of the Tincture. This is the other *Menſtruum*, whereby you may prepare Elixirs out of Gumms, Spices, *&c.* after the ſame manner as with the former *Menſtruum*.

Specifick or Antiſcorbuticks. Whilſt theſe ſorts of Remedies are adminiſtred in a ſmall doſe morning and evening, or firſt and laſt at Medicinal Hours, to wit, before eight in the morning, and four in the afternoon: other kind of antiſcorbutick Medicines are to be taken, which for the moſt part weare wont to preſcribe in a double form, to wit, ſolid and liquid to be taken together, ſo that the ſolid being firſt taken the other may be drunk after it: Of either there are very many Species and ways of Compoſition extant: *viz.* in the ſolid form, Electuaries, Confections, Powders, Pills, Tablets or Lozenges: In the liquid are Decoctions, Infuſions, Expreſſions, diſtilled Waters, and medicated Wines and Ale. Of every one of theſe kinds we will propoſe ſome more ſelect Medicines.

Electuaries.

PHAR. Part. II.

Electuaries.

Take of the Conſerves of the Leaves of Scurvy-graſs, of Roman Wormwood, of Fumitory, of each ℥ij, of the Powder of Winteran Bark, of the Roots of Angelica, Aron, each ʒij, of the Species of Diatrion Santalon ʒjſs, of the Powder of Crabs Eyes ʒj, of the Salt of Wormwood ʒij, with what will ſuffice of the Syrup of Citron Peels, make an Electuary.

Take of the Leaves of Scurvy-graſs, Conſerve of Brook-lime, made with an equal part of Sugar, of each ℥iij, of the Troches of Capers and of Rhubarb, each ʒij, of the Salt of Wormwood and of Scurvy-graſs, of each ʒj, of the Powder of Ivory and Coral calcined, of each ʒj, make it up into an Electuary with as much of the Syrup of the juice of Scurvy-graſs as will ſuffice.

I was wont to preſcribe Conſerves of the exterior Bark of Limons and Oranges, alſo of the Purple Flowers of the Aſh-tree, of the Leaves and Flowers of Cardamine, of the Roots of ſharp pointed Docks, and Engliſh Rhubarb prepared with an equal part of Sugar, which of themſelves or mixed with other Conſerves and *ſpecies* of the ſame kind are made into an Electuary.

Take of the Conſerves of the yellow part of Oranges and Limons, of the flowers of the Aſh Tree, of each ℥ij, of the Powder of the Roots of *Contrayerva* ʒj, of the leſſer Galangal ʒiſs, of the Roots of Aron ʒij, of the *Species Aromatic. roſat.* ʒj, of the ſalt of Wormwood ʒij, with as much of the Syrup of Candied Nutmegs, as will ſuffice to make it up into an Electuary. The doſe of theſe kind of Medicines is the quantity of a Nutmeg, drinking after it ſome proper Liquor.

For Country people and the poorer ſort, for whom leſs dear and more eaſily to be prepared Medicines are required, I preſcribe after this manner. Take of the leaves of Scurvygraſs and Brooklime, of each ℥iiij, of the whiteſt Sugar ℥viij, let them be well beaten in a Mortar together, adding of Winteran Bark powder ℥iſs, of Tartar calcined with Nitre ʒiij, with as much Spaniſh Wine as will ſuffice, let it be made up into an Electuary. The doſe about the quantity of a Walnut twice in a day, drinking an appropriate Liquor after it.

Take of the leaves of Scurvy graſs ℔j, of Raiſins of the Sun ſtoned, of white Sugar, each ℔ſs, the boylings of wild Radiſhes ℥ij: Let them be beaten together in a Mortar, and reduced to the form of an Electuary. The doſe is about the quantity of a Walnut twice or thice in a day.

Confections.

Take of Aron compound ℥j, of the powder of Winteran Bark ℥ſs, of the *Species* of *Diatrion Santalon*, of the Troches of Capers, each ʒij, of the ſalt of Wormwood and of Scurvygraſs, each ʒjſs, of the rinds of Candied Oranges ℥iij: Let them be bruiſed in a Mortar together, then add of white Sugar diſſolved, in as much as will ſuffice of the water of Earth Worms ℥iij, and ſo make it up into a Confection.

Take of the Roots of *Eryngo* and *Scorzonere* candied, of each ʒij of Walnuts and *Myrobalans* candied, each *N°.* ij, of electuary of *Saſſaphras* ʒvj, of the powder of Cubebs and Cardamums each ʒij, of the powder of the Roots of Zedoary, and of Angelica, each ℥jſs, of the ſalt of Wormwood ʒij, with as much Syrup of candied Walnuts as will ſuffice: Make a Confection.

Take of the powder of *China* Roots, of Saſſaphras wood, each ℥ſs, of yellow and white Saunders each ʒij, of the ſeeds of Rocket, Cubebs, *Naſturtium*, grains of Paradiſe, of each ʒiſs, of the *Species Dialacca*, Cinnamon, Orris, the leſſer Galangal, each ʒj, of the ſalt of Wormwood ʒij, of the Conſerves of the yellow of Oranges, and of Sugar *anthoſat.* ℥iij, diſſolved in as much water of Snails as will ſuffice, and as before make a Confection: The doſe as much as a Nutmeg twice aday, drinking after it ſome appropriate Liquor.

In ſome caſes of the Scurvy, whence there is need of the uſe of Steel, or of Steel prepared with Sulphur, add of it ʒiij, or of Vitriol of Steel ʒij, to any of the preſcriptions of the Confections or Electuaries, and after the taking of the Medicine once or twice aday, exerciſe the Body according to its ſtrength. *Chalybeat Medicines.*

Powders.

Take of the powder of Aron compounded ʒjſſ, of Winteran Bark ʒſ, of Cubebs, the grains of Paradiſe and of Cardamums, each ʒij, of the Salt of Wormwood ʒiij, of the Orange Tablets ʒiij. make a Powder: The doſe ʒj in a proper Liquor.

To the aforeſaid Powder add of the Nuts of the Indian Fruit *Cacao* ℔ſſ, let it be brought into a Maſs or Paſte in a warm Mortar, the doſe ʒij, Let it be taken after the ſame manner as Chocolate, *viz.* boyled in Spring water with either Roſemary flowers or Betony, or with the Roots of *Scorzonere*, or alſo with the ſhavings of Ivory or Hartshorn.

Pills.

For thoſe who had rather have the Medicine in a leſſer doſe, and Form of Pills; take of the Roots of Virginian Snakeweed, *Contrayerva*, each ʒij, of Winteran bark, ſeeds of Rocket and of Cubebs, each ʒiij, of the ſalt of Wormwood and of Scurvygraſs each ʒjſſ, of the extract or the rob of Juniper ʒſſ, and with a ſufficient quantity of the Syrup of preſerved Nutmegs, make a Maſs: Doſe 4 Pills aday, drinking after them ſome proper Liquor.

Tablets or Lozenges.

For the more delicate Tablets or Troches are preſcribed after this manner: Take of the powder of Winteran Bark, of the eyes of Crabs, each ʒiſſ, of the powder of Pearls ʒſſ, of the fineſt Sugar ʒvj, diſſolved in as much water of Earth-worms as will ſuffice, and boyled up to the height of Tablets: Add of the Spirits of Scurvy-graſs ʒij, of which make Lozenges or Tablets, each weighing ʒſſ, take about ʒj twice a-day, drinking an appropriate Liquor after it.

The Orange Tablets ſold in the Apothecaries Shops in Oxford.

TAke of the Rinds of Oranges, Limons, and Citrons preſerved, of each ʒj, of preſerved *Eringo* Root ʒſſ, of Pine Nuts and Piſtaches each 20, of ſweet Almonds blanched number 10, of the powder of Anniſeeds ʒſſ, candied Ginger ʒij, *Species* of *Aromatic. Roſat.* and of Nutmeg each ʒj, of the Roots of Galanga ʒj, ten Cloves, of Amber griſe *gr.* iiij, of Muſk and Civet of each ij grains, of the whiteſt Sugar ℔iſſ diſſolved in Roſe-water, and boyled up to a Tablet: Of which make Troches or Lozenges as before.

Liquid Medicines.

So much for Medicines in a ſolid form or more thick ſubſtance, that are wont to be given to ſcorbutical perſons: That the virtue of which might be the better and with the greater benefit, carried into the maſs of Blood, for the moſt part liquids are preſcribed to be drunk after them: Although great variety of them and divers ways of compounding them are extant, yet the chiefeſt and moſt uſual are thoſe we mentioned above, and ſhall now ſubjoyn the forms of each of them.

1. *Decoctions.*

Although Decoctions are the moſt familiar kind of liquid Medicines, yet more rarely made uſe of in the Scurvy, becauſe the ſimples which are chiefly beneficial to this Diſeaſe, as Scurvygraſs, Brooklime, *&c.* loſe their virtues received from the volatile Salt by boyling; yet becauſe Remedies by this means are eaſily and ſuddenly prepared, they ought to be admitted ſometimes, for that it has been found by experience, that they have ſome efficacy. For Country and poor People, an eaſie Medicine by this preparation is commended by many Authors. Take of the leaves of *Naſturtium Aquaticum* or water Creſſes iij handfuls, of the leſſer Sorrel *m* ij, being bruiſed let them

them be macerated or ſteeped in ſix pints of Milk, and then boyled till the third part be conſumed: Take of it from 6 to 8 ounces twice a day. A Decoction of Worm-wood is praiſed by *Eugalenus* and others, the following Remedy I have often tryed with good ſucceſs. Take of the tops of Broom *m* iij, cut ſmall and boyled in 3 pints of ſtrong Ale till half be conſumed; let it be taken from ij to iij ounces twice in a day. PHAR. Part. II.

2. *Infuſions.*

An Infuſion being added to the Decoction, makes a moſt profitable Medicine. Take of the Roots of *Scorzonere*, of Chervil, each ℥j, of the leaves of *Eupatorium* and *Chamepitys*, each *m* ſ, of burnt Hartshorn ℥ij, of Raiſins *m* ſ, boyl them in 3 pints of Spring water till the third part be conſumed, add then of Rheniſh Wine half a pint, and preſently ſtrain it into a glaſs veſſel, to which put of the leaves of Scurvygraſs and Brooklime each half a handful, of the rinds of Oranges ſteeped and cut ſmall ℥ſ, make an Infuſion warm and cloſe ſtopped for ſix hours, ſtrain it and let it be kept in a cloſe Veſſel: The doſe ℥vj twice in a day after a ſolid Medicine.

Take of Whey made with Whitewine or Cider ℔ ſ, boyl in this of the Roots of Burr docks and *Eringoes* ſteeped, of each ℥vj, of preſerved Juniper Berries ℥ ſ, the liquor being boyled away to the third part, let it be ſtrained into a Jugg, to which let there be put of the leaves of Scurvygraſs and of Brooklime each *m* j, make an Infuſion warm and cloſe ſtopped for 6 hours: The doſe half a pint twice in a day, after a ſolid Medicine.

Sometimes Infuſions made by themſelves are of notable uſe. Take of the leaves of Scurvygraſs *m* j, the ſlices of Horſe-radiſh Roots *m* ſ, Winteran Bark bruiſed ℥ij, let them be put in a glaſs Veſſel with Whitewine or Cider, and Scurvygraſs water, each ℔ j, let an Infuſion be made in a Cellar for 2 or 3 dayes: The doſe ℥vj to viij twice in a day as before.

3. *Juices and expreſſions.*

'Tis alſo a very commendable uſe to take twice or thrice in a day, of the Juice of antiſcorbutick herbs or fruits or their expreſſions, by themſelves or with their appropriate Liquors, for ſo it is preſumed, the virtue of the Remedy is exhibited whole and undiminiſhed.

Take of the leaves of Scurvygraſs, of water Creſſes and of Brooklime each *m* iij, being bruiſed let the Juice be wrung out hard, and kept in a cloſe Veſſel: The doſe ℥iſ ſ to ℥iij twice in a day, in a draught of Ale, Wine, or diſtilled Water.

Take of the leaves of Scurvygraſs *m* iiij, of Wood-ſorrel *m* ij, being bruiſed let the Juice be preſſed forth, which being put into a Glaſs cloſe ſtopped will quickly grow clear; for the ſharpneſs of the Wood-ſorrel precipitates the thicker parts of the Scurvygraſs: The ſame alſo happens if the Juice of Oranges is mingled with the Juice of Scurvygraſs, the doſe ℥ij, or ℥iij twice in a day.

Take of the leaves of Scurvygraſs *m* iiij, of Brooklime and of water Creſſes each *m* ij, of long pepper ℥iij, of the ſhavings of Horſe-radiſh ℥ij, all being bruiſed together let them be put into a glazed Veſſel, with Rheniſh or Spaniſh Wine which is beſt liked ℔ ij, the mouth being very cloſe ſhut, let it ſtand in a cold Cellar for two dayes, then let it be preſſed forth ſtrongly: The doſe is ℥iij twice in a day, after a ſolid Medicine.

Take of the leaves of Scurvygraſs *m* iij, of Brooklime and water Creſſes and of Wood-ſorrel, of each *m* j, being bruiſed pour on them of the water of Snails and of Earthworms each ℥vj, make an Expreſſion ſtrongly, which keep in a Glaſs cloſe ſtopped: The doſe ℥ij twice aday.

4. *Syrups.*

For the ſame reaſon as Decoctions ſo alſo Syrups are but little uſed in the Scurvy, for as much as the virtue of the ſimples chiefly efficacious, evaporates in the boyling; yet becauſe there is need ſometimes for ſweetning of appropriate Liquors with ſuch a Medicine for ſome; we will propoſe here our preparation, the ſtrength of the ingredients being preſerved as much as may be.

Therefore take of the leaves of Garden Scurvygraſs *m* vj, of the rinds of 4 Oranges and two Limons cut very thin, of the ſlices of Horſe-radiſh *m* ſ, of long pepper powdered

PHAR. Part. II.

powdered ℥iij, all being bruiſed together let the Juice be preſſed forth, which being preſently put into a cloſe ſtopped Glaſs, place in a cold Cellar till it ſettles and grows clear, then the Liquor being clear pour it off ſoftly into another glaſs, and being faſt ſhut let it be kept warm in *Balneo Mariæ*: In the mean time for every ounce, take of Sugar ℥iſs, and let all the quantity be diſſolved in as much of the water of Earthworms, and boyled up to a thickneſs, to which let the aforeſaid Liquor be poured by degrees, warm and ſtirred together with a *Spatula*: As ſoon as it is incorporated let it be taken from the fire, and being cold let it be put into a glaſs, and in this hang tyed up in a little Rag; of Cinnamon bruiſed ℥iſs, of the ſeeds of water Creſſes, and of Rocket powdered and mingled together, of each ℥j.

5. *Diſtilled Waters.*

Diſtilled Waters becauſe they are a neat and pleaſant Remedy, fill almoſt every Page among the anti-ſcorbutick preſcripts: Some diſpenſations of theſe eſteemed very profitable and fit, are in our *Pharmacopœa*; as the compound water of Radiſhes, and the mngiſterial of Earthworms and of Snails. Beſides, there are extant very famous preſcriptions of theſe ſorts of Waters, delivered by *Quercetan*, *Dorncrellius*, *Sennertus*, *Doringius*, and other Authors. Moreover every Phyſician is ready to preſcribe as occaſion ſerves, ſuch like appropriate to the condition of every ſick Body; for the anti-ſcorbutick Ingredients and others added, which may reſpect particular Diſtempers being received, and being cut, ſliced, and bruiſed, are put into ſome convenient Liquor, to wit, Whitewine, Cyder, or the Whey of Milk made by either of them; then let the whole mixture be diſtilled in a Cucurbit or in a Roſe Still: We will here ſubjoyn one or two forms uſed by us.

Take of the leaves of both the Scurvygraſſes, of Brooklime, of water Creſſes, and the tops of Broom of each *m* iiij, of the leaves of Germander and *Chamepitys* or ground Pine each *m* ij, of the Roots of Horſe-radiſh ℔ſs, of Aron, Angelica, *Imperatoria* or Maſter-wort each ℥iiij, the outer peels of 4 Oranges and of as many Limons, of the Roots of *Calamus aromaticus* ℥j, of Cinnamon, Cloves, each ℥ſs, being bruiſed and cut pour to them of the beſt Cyder, ℔viij, let them digeſt for two days in a glazed pot cloſe ſhut, then let them be diſtilled in a common Still, the firſt and laſt water being drawn off let them be mixed together.

In Winter time when green herbs are not to be had, we preſcribe after this manner: Take of the leaves of Scurvygraſs *m* iiij, the tops of Broom, Pinetree, and Juniper, of each *m* iij, the middle bark of the Elder Tree and of the Aſh Tree each ℥iij, of the Roots of Horſe-radiſh and of *Polypody* of the Oak, each ℥iij, the rinds of 4 Oranges and of as many Limons, of Winteran Bark ℥iiij, being cut and bruiſed put them into 8 pints of Whitewine or Cyder, or the Whey made of either of them, and let them be diſtilled.

The ſimple water of the leaves of Aron being diſtilled in the Spring time, is an efficacious Remedy againſt the Scurvy, if it be taken to the quantity of 3 or 4 ounces twice aday with ſome other Medicine.

The ſimple water of Scurvygraſs being poured upon freſh leaves bruiſed and diſtilled and ſo often reitterated with new cohobations, becomes an effectual Remedy: Moreover, the ſtrong Spirit of Scurvygraſs is prepared after this manner. Take of the leaves of Scurvygraſs as much as will ſuffice, being bruiſed let them be made up into Balls ſuch as thoſe of Woad which the Dyers uſe, then pour upon thoſe Balls being put into a well glazed Pot, either as much of the water of Scurvygraſs or of Wine of the ſame herb, as will cover them at leaſt 4 fingers, and let them be kept exactly ſhut for 3 or 4 dayes in ſome cool place, then let the whole matter, being put into an Alembeck be diſtilled: Let the diſtilled water, being put into a Cucurbit, be rectified, at firſt there goes forth the ſtrong Spirit, of which may be taken in a fit Vehicle from 15 to 20 drops.

6. *Anti-ſcorbutick Wine and Ale.*

I was wont to prepare ſimple anti-ſcorbutick Wine of excellent uſe, after this manner in the Spring or Summer time. Take of the leaves of Scurvygraſs gathered in a clear day as much as you pleaſe, being bruiſed and the Juice preſſed forth, fill a Veſſel of 3 or 4 Gallons with it, and putting thereto 1 or 2 ſpoonfuls of Yeaſt, let it ſtand to ferment for two days; then the Veſſel being cloſe ſhut let it be put into a Wine Cellar for 6 months, then the Liquor being clear and of colour like Spaniſh Wine,

Wine, draw it forth into Bottles and keep it for uſe: It may be kept good and incorrupt for many years, the doſe ℥iij or iiij twice in a day.

Medicated Wines, of which may be taken 4, 3, or 2 ounces at medical hours daily, as alſo at Meals, are prepared after this manner: Take of Scurvygraſs leaves *m* iiij, ſhavings of wild Radiſhes ℥iiij, of Winteran Bark ℥ſs, of the outer rind of 4 Oranges and of as many Limons, and let them be put into a glaſs with 12 pints of White-wine, Rheniſh, or thinner Spaniſh Wine: The Veſſel being cloſe ſhut up let it be kept in a cold place, and as often as you need, draw the Wine off clear.

It is a uſual thing to preſcribe for ſcorbutical perſons, medicated Ale or Beer to be drunk conſtantly for their ordinary drink: Let Ale or Beer be prepared as much as will fill a 4 Gallon Veſſel, and inſtead of Hops boyl therein of the tops of the Pine or the Firr-tree *m* iij, and after it hath fermented in the Veſſel, let there be put to it of the leaves of Scurvygraſs *m* iij, of the roots of ſharp pointed Docks prepared ℥iiij, the rinds of 4 Oranges, and after it hath ſtood 7 days drink of it.

Theſe ſort of medicated Ales may be prepared with other ingredients, according to the affection or temperament of the Patient, by which kind of Remedy the medicinal Particles altering the dyſcraſie of the Blood, being continually carried into its Maſs together with the Aliments, many have found much benefit in taking away the cauſe of the Scurvy. But for as much as we have ſhewn the cauſe of this, even as the *ſpecies* of the Diſeaſe to be two fold, and that hitherto the Medicines propoſed, reſpect only the ſaline ſulphureous intemperature of the Blood: In the next place it behoves us to add ſcorbutick Medicines, which are convenient in the other, *viz.* in the ſulphureous-ſaline dyſcraſie of the Blood.

CHAP. VIII.

Of Medicines of every one of the aforeſaid Forms reſpecting the Scurvy, being excited in a more hot Conſtitution, and ſulphureous-ſaline Dyſcraſie of the Blood.

IN ſome ſcorbutical perſons, the uſing much of the aforeſaid ſharp things, as Scurvygraſs, Horſe-radiſh, Winteran Bark, and others endued very much with a volatile ſalt, hath been found hurtful: Wherefore in ſuch like caſes where the morbifick cauſe conſiſts in a more hot dyſcraſie of the Blood, like to ropy wine, temperate Medicines leſs agitating the particles of the humors, apt to grow hot of themſelves are preſcribed: Wherefore we will here add the forms in the ſame order as the former, and firſt we will begin with the ſolid Remedies.

Electuaries.

Take of Conſerves of Brooklime, Cardamines, made with an equal part of Sugar, of each ℥iij, of the *ſpecies* of *Diatrion ſantalon*, and of *Diorrodon Abbatis* each ℥j, of the powder of Ivory ℥j, of Pearls ℥ſs, of the ſalt of Wormwood and of Tamarisk each ℥j, and as much as will ſuffice of the Syrup of Coral, make an Electuary.

Take of the Conſerves of wood Sorrel, and of Cynorrhodon or of Hyps each ℥iij, (or of the Conſerves of ſharp pointed Docks, and of the roots of Succory each ℥iij) of the troches of Rhubarb ℥ij, of the *ſpecies* of *Diamargarit. frigid.* ℥iſs, of Tamarisk Bark ℥j, of *Sal Prunellæ* ℥iſs, preſerv'd *Myrobalans* 2, and with what will ſuffice of the Syrup of preſerv'd *Myrobalans*, make an Electuary.

For the Poor I was wont to preſcribe this more ready Medicine. Take of the Leaves of Brook-lime ℥vj, of wood Sorrel ℥ij, of white Sugar ℥viij, let them be bruiſed and beaten together, by adding to it of the Flower of ſweet Fenil Seeds ℥ſs, of the Powder of Ivory ℥ij, of *Sal Prunellæ* ℥jſs, with what will ſuffice of the Syrup of the Juice of Brooklime, make an Electuary.

Confections,

PHAR. Part. II.

Confections.

Take of the Powder of China Root, and of the Male Pæony, each ʒj, of which and yellow Sanders, each ʒiij, of Ivory ʒjſs. of Pearls ʒſs. of Crabs Eyes ʒj, of Coral being ſteeped in the Juice of Oranges, and ground on a Marble ʒij, of the whiteſt Tartar ʒjſs, of white Sugar ℥vj, diſſolved in as much water of *Scordium* compound as will ſuffice. Make a Confection.

Take of the candied Eryngo Roots, and of Scorzonere, each ℥ij, of the Powder of Aron Compound ℥ſs, of the Species of *Diatrion Santal.* ʒij, of *Sal Prunellæ* ℥j, with what will ſuffice of the Syrup of Cloves. Make a Confection.

Powders.

Take of the Powder of the Leaves of *Chamepitys*, and of Aron Compounded, each ʒjſs, of Ivory Powder, of red Coral prepared with the Juice of Oranges, each ʒij, of the Orange Tablets ʒij, mingle them and make a Powder, doſe 1 Spoonful twice in a day.

Pills.

Take of the Species of *Diatrion Santal.* of *Diamargarit. Frigid.* each ʒij, of the Seeds of Citron and of *Carduus* bruiſed, each ʒjſs, of the Roots of Cretian Ditany, and of the male Pæony, each ʒjſs, of the Salt of Tamariſk ʒij, with what will ſuffice, of the Gelly of Harts-Horn or Snakes Skins, make a Maſs.

Tablets.

Take of *Species Diatrion Santalon*, of *Diamargarit. Frigid.* of each ʒjſs, of Perls powdered, of red Coral prepared, of Powder of Ivory, each ʒj, of Sugar ℥vj, diſſolved in Water of *Scordium*, and boyled up to a Conſiſtence, make Tablets as before.

If that with theſe ſort of temperate Antiſcorbuticks, there ſhall be any need of the uſe of Steel, let there be added to the Electuary or the Confection, or alſo to the Maſs of Pills, of the Magiſterium of Steel of *Mynſycthus*, or of the extract of Steel of our preparation ʒij: In ſome caſes of *Crocus Martis* about ʒijſs or ʒiij may be added to the like Compoſition: But it ſeems better to give the Chalybeates in the Liquors to be drunk after the ſolid Medicines, than to put them into the aforeſaid Compoſitions. It remains now that we preſcribe the forms of the Liquors.

Decoctions.

In the Scurvy excited after a long continued Feaver, theſe ſorts of Decoctions are given with benefit, which may purifie the Blood and plentifully move Urine.

Take of the Roots of Chervil, Scorzonera, Sorrel, Parſely, of each ℥j, of the Leaves of Agrimony, and Harts Tongue, each *m*j, of Harts Horn burnt ʒij, of the Rinds of 3 Apples, of Corinthian Grapes ℥ij, of Liquoris ʒiij, let them be boyled in 4 Pints of Spring Water till the third part be conſumed, add to it of *Sal Prunellæ* ʒij, or ʒiij. The doſe ℥vj, twice or thrice in a day.

Take of preſerved Eringo Roots ʒvj, of Graſs Roots ʒij, of the Leaves of Gooſe-graſs or Cleavers, *m*ij, of Agrimony and of Liver-wort, each *m*j, of Raiſins of the Sun, ℥ij, of white Sanders ʒj, of Liquoriſh ʒij, let them be boyled in 4 Pints of Spring Water, to the Conſumption of the third part. The doſe ʒvj, after a ſolid Medicine.

For Country, and the poorer ſort of People, that they might not fall into the Scurvy after a Feaver, I was wont to preſcribe that they ſhould take twice aday this following draught, *viz.* Take of the Rotts and Leaves of Dandelyon *m*iſs, let them be boyled in a Pint and half of Poſſet Drink till the third part be conſumed: let it be ſtrained and ſerve for two doſes.

Or take of the Roots of Dandelyon *m*ſs, of Citron and *Carduus* Seeds, each ʒj, let them be boyled in a Pint and half of Poſſet drink made of Apples or Cyder till the third part be conſumed.

Infuſions.

Infusions.

The Apozems but now prescribed become more powerful against the Scurvy, if being prepared without Liquoris, they be strained into a Jugg, into which let there be put of the Leaves of Brook-lime and of water Cresses or Cardamines, each *mj*, then make an Infusion warm, and close shut for 6 Hours. The Liquor at last being strained, let it be kept in close Vessels. The dose ℥vj twice or thrice in a day. Also make an Infusion of Whey boyled with the Roots of Dandelyon, or the Leaves of Fumitory strained into a Vessel with one handful of the Leaves of Brook-lime, and as much of Celandine the lesser.

Chalybeate Infusions are wont to be of frequent Use, to wit, of the Salt of Steel, or of the Magistery or Extract put into some Decoction or distilled Water; but as the natural Water or Spaws, so also the Artificial, of our preparation of Steel dissolved in Spring Water, and impregnated with the Infusion of Antiscorbuticks, hath been drunk with very notable Benefit.

Juices and Expressions.

Take of the Leaves of Brook-lime, of water Cresses, each *miiij*, of wood Sorrel *mij*, being bruised let the Juice be wrung forth, and let it purifie in a Glass close shut, which it will soon do. The dose is ℥iß, to 7 Ounces in a convenient Vehicle.

Take of the Leaves of Brooklime *miiij*, of the Branches or strings of English Rhubarb *mij*, being bruised let the Juice be pressed forth.

Take of the Leaves of Brooklime, of Cresses, of Cardamines, of the lesser Celandine, of wood Sorrel, each *mij*, being bruised let the Juice be pressed forth, add to it a fourth part of the Juice of Oranges: Let it be kept in a Glass.

Syrups.

As often as there is any need of Syrup for any other Composition, we make use of either the Compound Syrup of the Juice of wood Sorrel, or of Fumitory, or of Coral; or also a Magistral of the Juice of Brooklime may be prepared after the same manner, as we before prescribed concerning the Juice of Scurvygrass.

Distilled Waters.

Distilled Waters more temperate are prepared, either by changing the ingredients, or the *Menstruum*, or both.

As to the first, proceed after this manner. Take of the Leaves of Brooklime, Garden Cresses, Fumitory, Harts Tongue, Liverwort, Baum, the tops of Tamarisk and Cyprus, of each ℥iß, of the Roots of sharp pointed Docks, of the Polypody of the Oak, each ℥ij, of the outward Bark of four Oranges, of cleansed Snails ℔ij, being cut and bruised pour on them of Whey made of Syder, ℔vj, let them be distilled in a common Distillatory.

2. As the *Menstruum* is more weak, let the Ingredients be moderately hot.

Take of the Leaves of Scurvygrass, of Brook-lime, of Water and Garden Cresses, each *miij*, the Rinds of 4 Oranges, a pint of Snails, being all cut small, pour to them of the common Whey of Milk, or fresh Milk ℔vj. Let them be distilled in the ordinary way.

3. In the Scorbutick Atrophie and Tabid Disposition, where no hot thing agitating the Blood, Spirits and Humours ought to be admitted; both the Ingredients and the *Menstruum* ought to be temperate, and sweetning the Blood.

Take of the Leaves of Brooklime, of Cardamines, Harts Tongue, Maiden Hair, Liverwort, Betony, Agrimony, of each *mij*, of Snails cleansed ℔iß, (or the soft flesh of a Capon, or the Heart of a Sheep cut to pieces) being all scalded and cut, let them be bruised together, and then pour to them six Pints of fresh Milk (or Fumitory Water) and let it be distilled after the ordinary way.

Medicated Wines and Ale.

Although the use of Wines seems to be less agreeable in the Scurvy, excited by reason of heat, or the Sulphureous-Saline Dyscrasie of the Blood, yet when either the

PHAR. Part. II.

Stomach is more weak, or that by long cuſtom, they at leaſt require drink of Wine mixed with a little Water; the ſame ſort of Liquor ought to be prepared, both more temperate and alſo medicated. And firſt of all may be granted them ſmall Wines diluted with Water, and impregnated with the Infuſion of Baum, Borage, or of Pimpernel or Burnet, or others.

Moreover Wines are prepared of the Juice of Currans, Raſps, Cherries, and of other Garden Fruit, which being ripened by fermentation become very grateful to the Stomach, and purifie the Blood; Then Cyder, the familiar and almoſt genuine Wine of our Country, ſo it be clear, ſweet, ſoft, and without any ſharpneſs, helps very much in the Scurvy. Beſides to this Liquor, being freed from its Faeces, and put up into little Veſſels, may be put ingredients of various natures or kinds; *viz.* of which ſort are the tops of Pine or Fir-tree, the Flowers of Tamarisk, alſo the ſhavings of Harts-Horn, or Ivory, which will ſweeten the Liquor and preſerve it from growing ſour; for as much as the Particles of the fluid Salt abounding in that Cyder, being apt to cauſe it to grow ſour of it ſelf, are hindered by diſſolving the foreſaid Ingredients.

The more temperate medicated Ale or Beer, is preſcribed after this manner, *viz.* let there be Ale prepared to fill a ſmall Veſſel, holding 5 or 6 Gallons, in which inſtead of Hops, let there be boyled the tops of Pine or Firr Tree, or of Tamarisk, or the ſhavings of any of their Woods, then after it hath worked, put into the Veſſel the Roots of ſharp-pointed Docks dryed, (than which certainly there is not a more helpful remedy in the Scurvy) to theſe ſometimes may be added the Leaves of Brook-lime, Water-creſſes, Barberries, and alſo Orenges and Limons ſliced may be put into the Veſſel.

The Leaves of Harts Tongue, put into the Veſſel of ſmall Ale, after fermentation, gives it a moſt grateful taſt and ſmell.

CHAP. IX.

Of the Curatory Indication of the Scurvy, by which help is afforded to the Diſeaſe it ſelf, and to the Symptoms chiefly afflicting.

WE have hitherto treated concerning the Cure of the Scurvy, and ſhewed what belongs to the preſervatory indication, to wit, the taking away of the morbifick cauſe, *viz.* both the intentions of healing and manifeſt Remedies. Which kind of method being timely entred upon and rightly inſtituted, oftentimes performs the whole buſineſs, for that the cauſe of the ſickneſs or the Root being cut off, the diſtempers depending upon it wither away of their own accord. But yet we may not always follow this courſe directly, but ſometimes ſtepping of one ſide, go another way to work, becauſe ſometimes more grievous accidents and ſymptoms happen, which require peculiar and as it were extraordinary help of Medicine, which ought to be attended upon immediately, and the general Cure often interrupted: As to this it is to be obſerved, that when the diſtempers which follow upon the Scurvy, require proper Remedies according to the nature of every one of them, and the diſpoſition of the Patient, yet there ought always to be mixed with theſe Anti-ſcorbuticks. There will be no need to inſtitute a curatory method, againſt all the diſeaſes and diſtempers with which the Scurvy is wont to environ one, for ſo I might tranſcribe the whole practice of Medicine, but we ſhall have regard only to the ſymptoms chiefly afflicting, by which either the life of the Patient is endangered, or the principal Cure is hindred: By what means and with what Medicines ſuch may be cured, we ſhall now ſhew.

Of the Curing difficult Reſpiration and Aſthmatical Paroxyſms.

Difficult breathing with ſtraitneſs of the Breaſt and aſthmatical fits, ought to be taken away by appropriate Remedies, and to be preſcribed beſides the general method, otherwiſe the ſick may be ſoon brought into danger of life. As theſe kinds of evils ariſe for the moſt part in ſcorbutical perſons, by the vice of the Blood ſtagnating in the heart, or by reaſon of the pneumonick Nerves, being hindred in their function, ſo they are to be cured with Cardiacks or anti-ſpaſmodick Medicines, *viz.*

of

of Hartshorn, Soot, Blood, of mens Skuls, alſo the tincture of *Caſtor*, Antimony, or of Sulphur, the flowers of *Sal Armoniac*, the flowers of Benjamin, alſo *Elixir Proprietatis*, in theſe caſes are of excellent uſe: Which kind of Remedies may be given at every turn, with a doſe of ſome anti-ſcorbutick Liquor, proper alſo againſt the aforeſaid diſtemper. For the ſudden allaying of difficult breathing, merely ſpaſmodical when it afflicts very ſore, I never found a more ready Remedy than 10 or 12 drops of our tincture of opiate *Laudanum*, being given in ſome convenient Liquor, for that ſleep creeping on, the Spirits remit their inordinations, and being in the interim refreſhed, they reſume afterwards their priſtine task after a due manner. The more ſharp Clyſters which very much cleanſe the Belly, alſo ſudorifick Decoctions and Diureticks often give help.

Take of the Roots of Bur-Docks, of Butter-Bur, Chervil, each ℥j, of the leaves of Maiden hair and *Germander* each *m* i, of Bur-Dock and baſtard Saffron ſeeds each ʒiij, of Raiſins ℥ij, being cut and bruiſed let them be boyled in Spring water ℔iij, to the conſumption of the third part, add of Whitewine ℥iiij, let it be ſtrained into a Jug, to which put of the leaves of Scurvygraſs cut *m* j, of the roots of candied *Enula Campane*, and cut ſmall ℥ſs, let them infuſe hot and cloſe ſhut for three hours: The doſe ℥vj twice or thrice a day.

Of the Diſtempers of the Ventricle, that are wont to follow upon the Scurvy.

Sometimes ſcorbutical People are wont to be cruelly tormented with great pain and fulneſs of the Ventricle, alſo with a nauſeouſneſs and belchings, and ſometimes alſo with cruel and frequent vomiting. Which kind of vices ariſe ſometimes from the Chyle, being there degenerated into a putrefying humour, but more often from the morbifick matter being carried away, either by the paſſage of the Blood or the nervous Juice, and depoſited either in the cavity of the Stomach, or fixed in the nervous folds and membranes. In theſe caſes if a viſcid or ropy ſtinking matter, or otherways hurtful be caſt out by vomiting, and that it be ſuſpected that the cauſe remains within the cavity of the Ventricle, a gentle Vomit of wine of Squills, or of vitriol Salt, will be convenient to be taken: Or if the peccant humour diſturbs the Belly, either an extract of Rhubarb or an infuſion of it, the Salt or Cream of Tartar being added. But if the matter ſticks cloſely within the Membranes or nervous foldings, Diaphoreticks, or things reſtraining the effervencies of the Salts rather help: *Elixir Proprietatis*, or the flowers of *Sal Armoniac*, or the Spirits of Soot may be taken by turns, with the water of Rhadiſhes compound, or of Snails, or any other anti-ſcorbutick Liquor. In the mean time, once or twice in a day there may be applied to the region of the Stomach, a fomentation of Wormwood, Centaury, Camomil Flowers, the Roots of Gentian and others, boyled in White-wine, with woollen Stuphs dipt in it and wrung out very hot. The uſe of Clyſters is convenient, and not ſeldom Opiates yield great help.

Of the Pain of the Belly and Scorbutick Colick.

There is almoſt no Diſtemper requires the ſpeedy help of Medicine more than the Colick and torments of the Belly, which frequently happen in the Scurvy. Againſt theſe evils, Clyſters of ſeveral ſorts, Fomentations, Liniments, and Cataplaſms are adminiſtred. Here the uſe of Opiates are thought to be very neceſſary, certainly in this caſe that preſcript of *Riverius*, that purging Pills ſhould be adminiſtred with ſome *Laudanum* mixed with them, may take place; for by ſleep being moved, and a plentiful ſolution of the Belly being cauſed, very often the fits are taken away: But the powders of Shell-fiſh, by which the acetoſous Salts are imbibed or fixed, conduce very much to the profligating or driving away the morbifick cauſe. As for example, take of the powder of Crabs eyes, and of Egg ſhells each ʒiſs, of Pearls ʒi, make a powder, let it be divided into 12 doſes, let one of which be taken every ſixth hour, with ſcorbutick water, or with the decoction of the Seeds and Roots of Burdocks, as is above deſcribed, or elſe with poſſet drink, in which is boyled the Roots and ſeeds of Burdocks, the leaves of ſweet Marjoram, and Saxifrage, and the leaves of Scurvygraſs infuſed. In the ſcorbutick Colick, alſo in the diſtempers of the Ventricle, but now deſcribed; the uſe of *Epſom* and *Barnet* purging waters or the like, affords oftentimes very great benefit.

PHAR. Part. II.

Of the Lask and Dyſenterical Diſtempers.

An inveterate *Diarrhœa* ſuch as often happens to ſcorbutical perſons, ought in no wiſe to be ſtopped with aſtringent Medicines, nor is it eaſily cured by alteratives or every Anti-ſcorbutick: Purging waters impregnated with iron or vitriol are the beſt Medicines for this diſtemper: Next to theſe are the artificial ſpaws or chalybeate Medicines, which are wont to give notable help. *Crocus Martis* rightly prepared is to be preferred to all others, I have uſed the following method with good ſucceſs: Firſt a Purge of the powder or the infuſion of Rhubarb is to be inſtituted, with aſtringent Spices added, and often to be repeated every three or four days. In the other days, let a doſe of the following Electuary of the bigneſs of a Nutmeg be taken in the morning, and at 4 a Clock afternoon. Take of the Conſerves of common Wormwood made with an equal part of Sugar ℥vj, (in a more hot conſtitution, inſtead of this let Conſerves of red Roſes be taken) *ſpecies Diarrhodon Abbatis* ʒij, of the powder of white and red Sanders each ʒj, of *Crocus Martis* the beſt ℥ſs, with what will ſuffice of the Syrup of Steel, make an Electuary.

In dyſenterical diſtempers or a *Tenaſmus* or deſire of going to Stool, you muſt proceed after the like method; if it may be had, let the uſe of purging waters be inſtituted, beſides let often Clyſters Prepared of vulnerary decoctions be uſed. Lately I cured one greatly labouring with a tedious dyſentery, who had for a long while voided by Stool many ounces of Blood, by this Medicine. Take of the beſt Rhubarb in powder ℥i, of the powder of red Sanders ʒii, of Cinnamon ʒi, of *Crocus Martis* ʒiij, of *Lucatella*'s Balſom what will ſuffice to make a pilulary Maſs, he took 4 Pills ſometimes every day and ſometimes every other day for a week, and was perfectly cured. I alſo preſcribed him to drink medicated Ale conſtantly, with the roots of ſharp pointed Docks, and the leaves of Brooklime infuſed in it.

Of the Vertigo *and fainting of the Spirits, and other Diſtempers, that are wont to be joyned to the ſame ſcorbutical Affection.*

The *Vertigo* often comes upon an inveterate Scurvy, to which is wont to be added a fainting or frequent ſinking of the Spirits and almoſt a continual fear or dread of it, alſo a *ſtupor* or ſtiffneſs in the members, and a ſenſe of tingling or pricking here and there running about them, which kind of diſtempers proceed from the failure of the animal Spirits in the fountain it ſelf, and ſometimes of thoſe within the Nerves, both the Cardiack and thoſe ſerving for the motion of the Members; and when they depend on the Brain and nervous ſtock, being beſet very much with the ſcorbutick Salt, they are not eaſily cured. Cephalick Remedies, ſuch as are convenient in the *Vertigo* and paralytick Diſeaſes excited by themſelves, are to be adminiſtred with anti-ſcorbuticks mixed therewith: Therefore firſt of all a proviſion of the whole being made by fit Catharticks, and ſuch as are convenient in the Scurvy, you may proceed with appropriate Remedies againſt the ſaid Diſeaſe after this manner.

About the beginning of the Cure, let there Blood be taken from the veins of the Fundament by Leeches, and unleſs any thing may contradict, let it be at ſeveral times repeated.

Take of the powder of the male Peony root ℥ſs, of red Coral prepared ʒij, of an humane Skull and of Elks Claws each ʒi.

Take of the beſt Sugar diſſolved in the compound Peony water, or in the water of wild Radiſh, and boyled up to a conſiſtence ℥viii, of the beſt oyl of Amber rectified ℥ſs, make thereof Tablets, and take of them from ʒiſs to ʒii morning and evening, drinking after it a draught of the following diſtilled Water.

Take of the leaves of Scurvygraſs, of Brooklime, of Creſſes of the Garden, of the Lillies of the Valley, of Sage, Roſemary, and Betony, each *m* iii, of green Walnuts ℔vi, of the rinds of 6 Oranges and of 4 Limons, of the freſh roots of the male Peony ℔ſs, being bruiſed and cut, let there be put to them of the phlegm of Vitriol ℔j, of Whey made with Cyder ℔v, let them be diſtilled after the ordinary way, and let the whole water be mixed together: The doſe ℥iij, to ℥iiij.

Of Hæmorrhagies or Fluxes of Blood.

Great fluxes of Blood very often threaten great danger in the ſcorbutick diſtemper, in ſo much as the ſick are given over, for that reaſon to ſudden death, whilſt the

the Blood breaks forth now from the Noſe, now by the menſtrual Flux or at the hæmorrhoidal veins, even to the fainting away of the Spirits or ſwooning: Beſides that ſometimes being caſt out from the Lungs or Ventricle, gives a ſuſpition of an Ulcer lying hid, or at leaſt a great debility in the affected part: Wherefore if theſe bloody excretions are immoderate, or happen in an inconvenient place, they ought for the preſent to be ſtopped, and prevented for the time to come.

For the ſtaying of the Blood when it breaks forth immoderately, the method is commonly known, and there is nothing more to be done or particular in this diſtemper by reaſon of the Scurvy, than when excited upon other occaſions: But as to the preventing Hemorrhagies, Remedies, which take away the acrimony of the Blood, and bind up the mouths of the Veſſels being too looſe and gaping, are to be adminiſtred, either intention is beſt performed by Chalybeate Medicines. The uſe of vitriolick Spaws is very fit in this buſineſs, beſide the infuſions of Steel, Extracts, Salt, and ſuch kind of preparations which chiefly contain the ſaline or vitriolick nature of the Iron, are alway moſt profitable againſt Hæmorrhagies: by what means Iron and its preparations, produce theſe effects and ſeveral others in the humane body, we have ſhown already.

Take of the Conſerves of red Roſes, of Cynorrhodon or of Hipps each ℥iij, of the *ſpecies Diarrhodon Abbatis*, and *Diatrion Santalon* each ʒjſs, of the ſalt of Steel ʒj, of the beſt *Crocus martis* prepared ʒji, of red Coral prepared ʒiſs, with what will ſuffice of the Syrup of Steel, make an Electuary: Let the quantity of a Nutmeg be taken thrice in a day, drinking after it a draught of ſome proper Liquor.

For poor people I am wont to preſcribe after this manner, Take of the tops of Cypreſs, of ſtinging Nettles each ℥iiij, of Brooklime ℥ij, let them be pounded in a Mortar with ℥x of white Sugar, then add the thin ſhalings of Iron finely powdered ℥i, of the Powder of white and red Sanders each ʒij, with what will ſuffice of the Syrup of Nettle juice, make an Electuary: The doſe the quantity of a Walnut twice a day.

Take of diſtilled water, or of a temperate anti-ſcorbutick Decoction ℔ij, of our Steel prepared ʒij, mingle it in a glaſs: The doſe from 3 to 4 Ounces.

Take of the tops of ſtinging Nettles, of Brooklime each *m* iiij, being bruiſed let the juice be preſſed forth and kept in a Glaſs, the doſe ℥ij or ℥iij twice a day, with diſtilled anti-ſcorbutick Water.

Of the Vices of the Mouth coming of the Scurvy.

As ſoon as the ſcorbutick Taint ſeiſes on the parts of the Mouth, ſo that the Gums begin to ſwell, and their fleſh to become ſpungy, preſently Remedies which may drive away putrefaction from them, are carefully to be adminiſtred: Among theſe, things to waſh the mouth and liniments are of chief uſe, whilſt the Diſeaſe is beginning about theſe parts, or growing grievous therein, which yet have reſpect to various intentions, and ſo are ſeverally to be prepared, *viz.* the fleſh of the Gums at firſt ſwelling up, are to be freed and dryed from the incurſions of the Corrupt and ſalt Blood or *Serum*: Afterwards their fleſh growing flaggy and falling from the Teeth, is to be defended from rottenneſs, and alſo that it may more ſtrictly embrace the Teeth, it is to be conſtrained or bound cloſer, for theſe and perhaps other intentions, Gargariſms or waters to waſh the mouth of ſeveral kinds are inſtituted: The chief Ingredients of which for the moſt part are boyled vegetables and infuſed Minerals. The Herbs or Roots which are boyled in ſome fit liquor, *viz.* Water or Wine are moſt commonly either ſharp, bitter, or ſtyptick or binding, and ſo theſe ſort of Decoctions are impregnated, either with a Volatile, Lixivial, Vitriolated, or chalybeated, or aluminous Salt, we will here ſhew you ſome forms of every kind of them.

1. When therefore the fleſh of the Gums begins firſt to ſwell up, and to become ſpungy by reaſon of the influx of a corrupt and ſalt Blood and *Serum*; take the middle bark of the Elder Tree and of the Elm each *m* ʒs, of the leaves of Savory, Sage, Hedg-muſtard, garden Creſſes, each *m* j, of the roots of Pellitory ʒij, being bruiſed and cut let them be boyled in ℔iij, of Lime water, to the conſumption of the third part: If a ſweetning be required, add of honey of Roſes ℥ii, make a Gargal. Or take of Camphorated Vitriol ℥i, (commonly called by our Countrymen by the name of Captain *Green*'s Powder) a quart of Spring water, mingle them in a glaſs and ſhake them well together, and then the Liquor ſettling and growing clear, may be made uſe of. Or let there be prepared a Lye of the aſhes of Broom, or Roſemary, or of Nitre,

or

PHAR. Part. II.

of Tartar calcined, boyl in 3 pints of this, of the leaves of Savory, Thyme, Sage, Roſemary, each *m* j. when it is ſtrained put into it two handfuls of Scurvygraſs leaves, make an infuſion cloſe and warm for three hours, then let it be ſtrained again, and kept to waſh the mouth often in a day.

For the ſame intention alſo, Liniments may between whiles, and eſpecially at night be applied, that their virtues may be communicated to thoſe that are ſick, or while they are ſleeping. There is a preſcript very celebrious among Authors, and by long uſe confirmed. Take of the leaves of Columbine, of curled Mint, Sage, Nutmeg, Mirrh (which ſometimes may be omitted) of each ℥ij, of burnt Allum ℥ſs, of Virgin Hony ℥iiij, or what will ſuffice, make a Liniment according to Art.

2. When the Fleſh of the Gums growing flaggy, forſakes the Roots of the Teeth, ſometimes a light Scarification may be adminiſtred, beſides let the mouth be waſhed with this Decoction. Take of the tops of the Bryar, Cypreſs and Lady-ſmock Leaves, each *m*j, let them be boyled in three Pints of Water, in which Iron hath been quenched, to the Conſumption of the third part, to the ſtraining add of Hony roſat. ℥ij, mingle them.

This kind of Liniment may be applyed. Take of the Powder of the *Florentine Oris*, of the Leaves of Sage and of St. *John*'s Wort, each ℥ij, of bole Armenic, of *Sal Prunellæ*, each ℥j, of freſh Virgins Hony, as much as will ſuffice, let them be well incorporated, by working them together.

3. When the Gums begin to putrefy and corrupt, and alſo the Teeth, and the fleſh about them grow looſe and yield a noyſom Savour, more ſtrong Medicines and great reſiſters of Putrefaction are adminiſtred, here an infuſion of Vitriol Camphorated, alſo of the Medicinal Stone, have the chief place.

Or take of the Roots of Gentian, and of round Birthwort being cut, each ℥ſs, of the Leaves of the leſſer Centaury, Pontick Wormwood, Savory, Columbine, each *m*j, let them be boyled in Lime water, or a Lie made of either Iron or Alum ℔iiij, to the conſumption of the third part. Add to the Colature of raw Hony ℥ij or iij, mingle them.

4. If the falling out of the Teeth be chiefly feared, take of the Bark of the Roots of the Sloe Tree ℥j, of Tormentil and Biſtort whole, each *m*j. of the outer Rinds of Pomegranats, and the Flowers of the ſame, each ℥ſs, let them be boyled in three Pints of Spring Water. Add to it when ſtrained, of Alum 2 or iij drams, of the beſt Hony ℥ij, mingle them. Take of Vitriol Camphorate, of burnt Harts-horn, each ℥j, of Nutmeggs ℥ſs, of the beſt Hony what will ſuffice, make a Liniment. Or take of the Powder of the Root of Biſtort, of the Rinds of Pomegranats, of bole Armenick, of burnt Allum, each ℥j, of Hony of Roſes what will ſuffice, add of the Spirit of Vitriol ℈j; make a Liniment.

5. If at any time (as ſometimes it is wont) that deep and putrid Ulcers eat into the Gums or other parts of the Mouth, the aforeſaid more ſtrong Remedies are often to be uſed. Beſides, let little raggs be often applyed to the affected place, ſteeped in Egyptian Oyntment diſſolved in the Spirit of Wine, or in an Infuſion of Sublimate, or of the medicinal Stone. In theſe caſes the Cure is to be left to a skilful Chirurgion.

Of the Pains that are wont to Infeſt the Leggs, and ſometimes other Limbs, Chiefly in the Night.

Againſt theſe Pains, for indeed they are ſometimes very bitter; beſides the general method of curing the Scurvy, Specifick Remedies, and things helping this Symptom are ordered. Therefore in ſuch a caſe, the means of Purgation being inſtituted, and Phlebotomy alſo (if there be need) celebrated, it is convenient to ſet upon the Diſeaſe with inward Phyſick, and outward Topicks.

As to the firſt, thoſe which move by Sweat and alſo by Urine, does often avail, for that they carry another way, the lixivial and ſour recrements of the Blood and nervous Juice, that are wont to be gathered together in the affected part: But chiefly thoſe things are to be adminiſtred, which may defend either Humour from its depraved nature, *viz.* both Saline and Sour: ſhelly Powders, Crabs Eyes, Jaws of Pikes, alſo Spirits, and Flowers of *Sal Armoniack*, Spirits of Blood, Tincture of Antimony and of Coral: Decoctions of the Roots and Seeds of Burdocks, *Chamepitys*, Germander, very much help. Which kind of Remedies are to be taken twice or thrice a day with Antiſcorbutick diſtilled Waters. Water diſtilled out of Horſedung, to which is added Scurvygraſs, Brooklime, Gout Ivy, and ſuch like, is ſometimes very profitable.

profitable. In the mean time Liniments, Fomentations, Cataplasms and such kind of Applications which allay Pains, are outwardly to be applyed.

Of the wandring Scorbutick Gout.

Engalenus, *Wierus*, the *Campen* Physitian, and *Gregorius Horstius*, have wrot particularly of this distemper, said to be very frequent in the Northern Countries of *Belgia*. A certain Sign of which is manifested by putting alive Worm to the grieved place, for he is presently wont to leap off, twine himself about, bend himself round, to slide along, and to dye: which I have also often experimented on our Country-men. The reason of which Experiment (as it seems) is this: we have determined the cause of the Pain and Tumour stirred up in the affected part, to be for that the saline or Lixivial Fæculencies from the Blood, and the sour, from the nervous Juice, being deposited in the same place, do mutually ferment or grow hot, even as Spirits of Vitriol and Salt of Tartar, mingled by deliquium or melting: further from such a striving and agitation of dissimilar particles, as the Pain and Tumour are caused, so indeed very sharp, and as it were Corrosive *Effluvia's* plentifully evaporate, which kill the worm laid upon the grieved place, even as if he should be held over those Liquors boyling: Because of the effect of this Experiment, the cure of this Disease has been ordained by Worms, to wit, Remedies prepared of them; but I know not whether being taken inwardly, they so certainly destroy the Disease, as they being applyed outwardly, are destroyed by the Disease. Even as Worms, so also Snails, Hog-lice, or Sows, and other bloodless little animals, for that they abound in a volatile Salt, do often enough become an efficacious remedy.

Henry Petræus relates two remedies used against this Disease, in *Westphalia*. Take 9 Worms bruised together, with two spoonfuls of Wine in a Mortar, and wrung out hard through a woollen Cloth, to these add half a measure of Wine, and let it be taken 3 spoonfuls morning, noon and night, for several dayes. 2. Take two or three spriggs of Savin, two spoonfuls of Virgins Hony, let them be boyled in a measure of Wine, till two fingers breadth be wasted: let it be strained, and take of it 4 or 5 spoonfuls thrice in a day. A certain Vulgar Potion, a kin to the former Medicine is cited by *Horstius*, and called the Monasterie Potion: Take of Sage, Betony, Rue, of each 5 Leaves, of earth-Worms, every one with red rings about their Necks, number 5, a little Savin, of Devils-bit Roots 2, let them be bruised with Water of Elder Flowers, and the Juice being pressed forth, let it be given to move Sweat. Also the like Prescript is proposed by the *Campen* Physitian in *Forestus*.

Certainly in this distemper the Magisterial Water of Earthworms, prescribed in the London Dispensatory, is extreamly convenient. I have often given also with good success, the Spirits and Salts of Hart's-horn, the Spirit of Blood, and the Flowers of *Sal Armoniack*. Besides the shelly Powders, as of Crabs Eyes, Corals, Perls and Vegetables, which have in them Antidotes for the Gout, as the Roots of Birthwort, the Leaves of Groundpine, Germander, and the like joyned with Antiscorbuticks, conduce to the cure of this Disease. Outwardly, for the allaying of the Pains, besides Anodynes, things under the form of a Liniment, Fomentation or Cataplasm, are made use of: The Oyl of Earth-worms, Froggs, and Toads, are often very profitable. I was told by a very signal Person much obnoxious to this Disease, that the Water of the Contents, taken from the Ventricle of an Ox newly killed, and drawn off clear by distillation, and with Raggs dipt in it warm, and applyed for a Fomentation, brings certain help.

Of the Convulsive and Paralytick Distempers that are wont to come upon the Scurvy.

When at any time the scorbutick Taint breaking in upon the Brain and Nervous Stock, doth greatly infect the moistning Liquor of either Province, for that reason indeed, several Diseases, and chiefly the Paralytick and spasmodick, or cramplike distempers (as we have already shown) are wont to arise: even according as the morbifick matter, being carried to the Animal Kingdom, shall be either narcotick or explosive. Although these kinds of Distempers shall be accounted in this case Symptomatical, yet they being very grievous, do challenge for themselves both the name and the greater part of the Cure, before their parent the Scurvy; so that the Sick is said rather to labour with the Palsy, or the Convulsion, then with the Scurvy, and also Medicines proper for those distempers, are at the same time proposed, with the others requisite to other intentions.

For

PHAR. Part. II.

For the curing thoſe Diſtempers coming upon the Scurvy, that chiefly muſt be performed, that the Remedies appropriate to them be rightly or conveniently applyed with Antiſcorbuticks. As to the Convulſive Diſeaſes, what I have made known in a former tract, may be eaſily transferred hither. But as to the Palſie, Lethargy, and many other diſtempers of the Brain, and nervous Stock, we intend ſhortly to make publick ſome ſpecial Diſquiſitions thereupon: In the mean time it is not fit, that we ſhould in this place foreſtal the therapeutick Method, which belongs to thoſe diſcourſes, but rather we will propoſe what may ſeem neceſſary at the end of this Work, the Caſes and Cures of ſome ſcorbutick Perſons, lying ſick alſo of thoſe Diſeaſes.

Of the Atrophy or waſting of the Fleſh: alſo of the Scorbutick Feaver, which oftentimes is either the Cauſe of it, or the accident, or effect of it.

There are three kinds of Cauſes, hanging by a certain Series, from one of which or more the ſcorbutick Atrophy without the Conſumption of the Lungs is wont to be produced, *viz.* either the Chyle is perverted by the default of the firſt paſſages, by which means it does not carry ſufficient or laudable proviſion to the Blood. Secondly, or being brought to it, yet by the fault of the Blood it is not rightly changed into Blood and nutricious Juice. Or thirdly and laſtly, the nutricious Juice being prepared in the bloody Maſs, by reaſon of the fault of the nervous Liquor, is not rightly aſſimilated in the ſolid parts.

The Remedies appropriate to this Symptome reſpect either the emendation of the firſt paſſages, or of the aforeſaid Humours. As to the firſt, ſometimes it happens by reaſon of the Tone of the Stomach being broken, or its Ferment vitiated, ſo that it comes to paſs that the aliments put therein are not rightly dreſſed, but turn into an unprofitable Rottenneſs. To theſe ſort of evils, gentle Catharticks, digeſtives and ſtrengthners are to be adminiſtred. But more often the work of Chylification or of making the Chyle, is hindered by reaſon of a Schirrous Tumour, being excited now in the Ventricle, now in the Meſentery or in the circumjacent part. In this caſe opening and diſſolving things are convenient; and the uſe of Spaws or Purging Waters has bore away the Bell from all other remedies: Beſides Fomentations, Liniments, or Plaiſters, ought to be outwardly applyed.

Further, it ſometimes happens that without any Tumour ſtirred up in the *Viſcera*, the milky Veſſels being impacted by ſome thick and viſcous Matter, to be ſo much obſtructed, that the Proviſion of Chyle, though laudable enough and plentifully made, is not ſufficiently carried into the Blood. In this diſtemper, for the moſt part the Belly voides copiouſly white excrements like curdled Milk, and not like others dyed or ſtinking with Choler. The reaſon of which is, for that the impoveriſhed Blood more ſparingly begets the yellow bile, from which being poured into the Inteſtines, the colour and ſtink of the Excrements proceed. In this caſe the purging Spaws are convenient, and alſo with things opening, taken inwardly, Liniments, Fomentations, and Baths are uſed outwardly.

Againſt the *Maraſmus* or waſting of the Fleſh, ariſing from the fault of the Blood, degenerating from its Complexion, Aſſes or Cows Milk diluted with Water, or other proper Water diſtilled, often brings help. The broth of Snails or milk Meats, with them boyled in them; beſides diſtilled waters of Milk or Whey, with Snails and temperate antiſcorbutick Herbs mixed, help very much in this Caſe: alſo to this end, decoctions with Vulnerary and antiſcorbutick Herbs infuſed therein are taken with good ſucceſs: In the mean time Frictions to the external parts, with woollen cloathes made warm and dipped in reſumptive Oyntment, or the freſh Oyl of Walnuts, may be daily adminiſtred.

When the Atrophy ariſes from the Vice of the diſtempered Blood, perverting by that means the nutritious Juice, it hath moſt commonly joyned with it, an erratick Feaver with nightly ſweats, for that the ſanguinous Maſs is compelled to inequal and uncertain effervencies by that degenerate Juice; and that the ſo troubleſome matter is caſt out by the nightly Sweat. In this caſe a ſlender Diet being ordered, let them often take Decoctions and diſtilled waters, which fuſe and purifie the Blood, with antiſcorbuticks mixed therewith.

Take of the ſhavings of Ivory and of Hartſhorn each ʒiiſſ, of *Eringo* Roots preſerved ʒvj, of the Roots of Chervil, Dandelyon, each ʒſſ, of the leaves of Harts Tongue and Liverwort each *m* j, one Apple cut, of Raiſins of the Sun *m* j, let them be boyled in Spring water ℔iiij, to the conſumption of the third part: Being ſtrained, put into it of the leaves of Brooklime bruiſed *m* ij, of *Sal Prunellæ* ʒiiſſ, or of fixed

Nitre

Nitre ʒj, make an infuſion warm and doſe for 3 hours: Take of it iiij or ʒvj thrice in a day. PHAR. Part. II.

Take of the leaves of Brooklime ℔iiij, of Sorrel and Dandelyon whole each *m* ij, of Snails cleanſed ℔iiʒ, the rinds of two Oranges: Being ſliced, cut, and beaten, pour to them of ſweet Milk or Whey made with Cyder, or of the Juice of freſh Apples ℔vj, let them be diſtilled after the ordinary way, take of it ʒiii twice or thrice in a day.

Of a Rheumatiſm.

This Diſtemper we have determined to proceed from the congreſſion and mutual effervencies of the Salts which are of a divers nature and generation, to wit, of the fixed coming from the Blood, and the acetous coming from the nervous Juice.

The ſubjects of either Salts are the ſuperfluous feculencies depoſited, and by the aforeſaid humours acted into certain turgeſcencies or riſings up, being ſpread abroad into the parts, now into theſe now into thoſe: Wherefore that the Diſeaſe may be cured, and the turgeſcencies of the humours allayed, both their ſuperfluous feculencies are to be purged forth, and alſo both the degenerate Salts of either order, are to be reduced and made volatile.

For the two former intentions, a light Purge and Phlebotomy are chiefly required, and ought to be often repeated according to the ſtrength of the Patient; alſo Diureticks and Diaphoreticks which may convey forth ſome way the Salt Seroſities, are next to be given: That theſe ſort of Evacuations may the better ſucceed leiſurely, with a good habit and nature aſſiſting, Opiates are often made uſe of: For the other ſcope on which the chief hinge of the cure doth turn, alteratives, and chiefly thoſe which are indued with a volatile Salt, do greatly help: Wherefore in this caſe it is a common, but not to be contemned Medicine, to drink twice or thrice a day 4 or 6 ounces of an Infuſion made of Stone-horſe dung, in ſmall Wine or Ale or in proper diſtilled water. But a Medicine a little more grateful, though not more efficacious may be prepared, if a water be diſtilled out of that Dung with anti-ſcorbutick Ingredients, infuſed in Whitewine or Cyder; which may be taken twice in a day from ʒiij to ʒiiij, I have often preſcribed in this caſe Spirit of Hartshorn, and of Blood, with very ſignal benefit to the ſick.

Of the Dropſie.

As we have determined that the Dropſie that is wont to ſucceed upon the Scurvy, is two fold, *viz.* habitual and occaſional, we ſhould utterly loſe our labour to ſpeak of the cure of the former; for in truth no Remedies can be able to reſtore the Liver, and the Lungs, and the other *Viſcera* ſometimes vitiated, and the complexion of the Blood wholly overthrown. In ſuch a caſe if any thing be thought fit to be done, the bounds of Medicine will be but narrow, for neither for Cathartick nor Diaphoreticks, nor for any other more ſtrong ſort of Evacuation, is there any place left: Therefore chiefly and indeed only Cordials and Diureticks muſt be inſiſted on. To theſe ends, *Elixirs*, Tinctures, Electuaries, Powders, Infuſions, Decoctions, diſtilled Waters, *&c.* which are partly againſt the Dropſie and partly againſt the Scurvy, are to be adminiſtred; but becauſe they ſignifie little we ſhall omit preſcribing their forms.

The ſcorbutical Dropſie ſuddenly excited from an evident or certain occaſion, as hath been ſhown, very often admits of a Cure, which that it might more eaſily ſucceed, firſt of all the tumults of Nature are to be quieted, and its inordinations to be ſuppreſſed: Wherefore if waking do very much infeſt, Sleep muſt be allured by the uſe of Opiates, and then it muſt be provoked as often as there is great need. As ſoon, as by reaſon of ſtrength, it may be lawful to purge, let the following Powder be taken, and a due ſpace being between let it be repeated, and in the interim let the Belly be kept ſoluble by frequent Clyſters. Take of *Mercurius Dulcis* ʒj, of the reſine of Jalap *gr.* v to 10, of Cloves ʒſs, mingle it, and let it be given in a ſpoonful of Watergrewel; at other times Diureticks and ſometimes Diaphoreticks are carefully to be taken. Take of the tincture of the ſalt of Tartar, impregnated with an infuſion of *Millepedes* or Hoglice as much as you will, let there be taken of it ʒj to ʒij twice in a day, with an appropriate Liquor.

Take of the Spirit of *Sal Armoniac* what you will, the doſe ʒſs to 15 drops after the ſame manner. Take of *Millepedes* prepared ʒiij, of the Salt of Tartar ʒij, of Nutmegs ʒj, mingle them and make a Powder: The doſe ʒſs twice in a day with a

PHAR. Part. II.

proper Liquor. Or take of Bees dryed and powdered ʒij, of the powder of Ameos Seeds ʒi, of the oyl of Juniper ℈j, of Turpentine, what will ſuffice, make a Maſs of Pills: The doſe ℈j ʒſs twice aday, drinking after it a ſpecifick Liquor.

Take of the leaves of either Scurvygraſs, of water Creſſes, Pepper wort, Arſeſmart, each *m* iij, of the Roots of Aron, Briony, of the Florentine Oris each ʒiiij, of the middle Bark of the Elder Tree *m* ij, of Winteran's Bark ʒij, the outward rinds of 4 Oranges and of 3 Limons, of new Juniper Berries ʒiiij, being cut and bruiſed, put to it of Rheniſh Wine 3 pints, of Wine of the Juice of Elder Berries ℔ij, let them be diſtilled after the ordinray way, and let all the water be mixed together. Doſe ʒiij to ʒiiij twice in a day, after a doſe of any of the Medicines preſcribed before.

Let there be prepared Decoctions and medicated Ale, ſuch as hath been before deſcribed, adding thereto anti-dropical Ingredients.

Of the Crackling of the Bones.

There yet remains a ſymptom ſometimes, though rarely coming upon the Scurvy, *viz.* a crackling of the Bones, the cure and reaſon of which being omitted in the former Pathology, it will not be amiſs to ſpeak of it here. I have known ſome, but not above three or four, who whilſt they laboured with the Scurvy were troubled with its evil, not only in the humours and fleſhy parts, but at laſt alſo in the Bones themſelves, for as often as they bended any of their Members any way, the heads of the Bones as if they were naked, rubbing againſt one another made a great noiſe: Further, as they lay in bed and turned themſelves from one ſide to the other, a great noiſe from the colliſion of the *Vertebræ*, as if it were the ſhaking of a skeleton, was plainly heard, even affrighting thoſe ſo affected.

The Conjunct Cauſe of this perhaps may ſeem to be, that the ſoft *interſtitium* of the Bones, *viz.* the Fat, Membranes, and Ligaments, being greatly waſted, their junctures even as milſtones, being altogether emptied by reaſon of their mutual rubbing together, make a noiſe: But the matter is quite otherwiſe, becauſe thoſe that are greatly waſted away have not this crackling noiſe of the Bones, nor do thoſe who labour with this Diſtemper always waſte off their fleſh: Wherefore we rather ſay that the immediate cauſe of this ſymptom, is the dryneſs of the Bones or a defect of the *medulla* or marrow ſo properly called, which ought to be contained within the cavities of the Bones, and chiefly within their heads: For as certain Bones do include marrow or an unctuous humour every where ſhaken out, either from the great cavities or pores, and the ſmall paſſages, we have determined the uſe of this to be, that both the Bones being thus moiſtned, may become leſs brittle, and moreover, that this humour moiſtning the knobs of the Bones, may make ſlippery all the joyntings, even as Greaſe or Oyl the hinges of a Machine, and by what means facilitates their motion: Wherefore the heads of the Bones being deſtitute of this marrow, make a noiſe like to the wheel of a Cart that is ſeldom greas'd.

But if the procatartick or more remote cauſe be inquired into, *viz.* wherefore that unctuous liniment of the Joynts becomes defective; this indeed is to be imputed either to the vice of the Blood, as if it did not ſupply the Bones with aliment, participating equally with Sulphur and Salt, which truly ſeems unlikely, becauſe the bloudy Maſs alſo in ſcorbutical perſons, contains Particles of either of the aforeſaid kinds, and for that theſe labouring with the crackling of the Bones, have their Skin & Muſcles ſufficiently moiſtned with fatneſs: Or ſecondly and more likely, this unctuous humor by which the Joyntings are made ſlippery is wanting, through the fault of the Bones themſelves, *viz.* becauſe their pores and paſſages being ſo much obſtructed by ſome extraneous, and perhaps muddy matter, or tartareous carried thither by the Blood, that for that reaſon they cannot receive ſufficiently the Balſom deſtinated for them, nor ſend it forth for the moiſtning their Joyntings: It will not be eaſie (for that the matter lies ſo abſtruſe) to inveſtigate the particular reaſons of this Diſtemper, nor to conjecture further in this Ætiology.

We are no leſs at a loſs, how to proceed in the cure of this Diſeaſe: For although the primary indication, *viz.* the humectation of the Bones or Joyntings is obvious enough, yet by what means and by what Remedies that ſhould be performed, does not ſo plainly appear. For I have known in this caſe very many kinds of Medicines, and ſeveral ways of Adminiſtrations tryed altogether in vain. A certain ingenious man, labouring for many years with this Diſeaſe, had taken the advice of many, and of the moſt famous Phyſicians, and beſides the uſual Remedies againſt the Scurvy, (together with often letting Blood and purgations, from which he received no help) he tryed various and long courſes of Phyſick without any ſucceſs: for after he had under went a method preſcribed by one Phyſician for ſome months in vain, he applyed himſelf to another and ſo again to more. In the mean time, from each of them was

preſcribed

preſcribed always a new way of curing, uneſſayed by the former: Fomentations, Liniments, and Frictions are daily applyed to the Joynts, and ſometimes the Baths or Bath were uſed, and then ſeveral ſorts of purging waters, ſometimes one ſometimes another were drunk; all which nothing helping out, a chalybeate courſe was taken, and another time a decoction of the more temperate woods, ſometime a Milk Diet, and again at another time Electuaries, diſtilled waters, *Apozemes*, and other Remedies prepared againſt the Scurvy. After this manner when he had lived almoſt conſtantly medically and miſerably above three years, and nothing profited as to the Cure of the aforeſaid Diſeaſe, but in the mean time he was indifferently well as to his ſtrength and Stomach, he married, and as to the reſt of the common Symptoms of the Scurvy became better: Hence it appears too pertinacious a Diſeaſe, yielding almoſt to no Remedies, the crackling of the Bones is, which I have alſo proved in others, labouring with the ſame Diſtemper altogether mocking and eluding the skill and pains of the Phyſician.

CHAP. X.

Of the Vital Indication, in which are included Cardiack Medicines, Opiates, and Diet, or the manner of living as to Eating or Drinking, requiſite in the Scurvy.

WE have hitherto largely unfolded the Indications both Preſervatory and Curatory, which belong to the Cure of the Scurvy, it yet remains that we ſpeak of the vital Indication, to wit, that we may declare by what method and by what Remedies, the ſtrength of the ſick being too apt to languiſh, may be ſuſtained, or being loſt and caſt down may be reſtored. For theſe ends, Cordials and Opiates are preſcribed to be taken, according to the exigencies of the ſick, and beſides a right way of living as to Diet, and if need be an analeptick or reſtorative, and always anti-ſcorbutick is preſcribed.

As to Cardiack Medicines, to wit, which throughly agitate the Blood, ſtagnating in the heart, reſuſcitate or raiſe up its half ſpent flame, reſtore the animal Spirits oppreſſed or diſtracted to a free and due irradiation, it is obvious that very many Remedies which properly are called Anti-ſcorbuticks, do perform theſe intentions, of which ſort are the compound water of Radiſhes, the magiſterial of Snails and Earthworms, the Spirits of Hartshorn and Soot, the ſhelly Powders with many others, which are not only taken with benefit at certain hours, according to a method ordained in a certain order, but alſo as occaſion ſhall ſerve when ever a *ſyncope* or fainting of the Spirits ſhall happen.

But beſides thoſe who are found very obnoxious to paſſions of the Heart, frequent Swoonings, Nauſeouſneſs, Vomiting, Tremblings, *Vertigo's* and other horrid Symptoms, have alſo ready other ſorts of Medicines, more properly Cordials, by which they give relief immediately to their fainting Spirits. To this end is very convenient the *Elixir Vitæ* of the greater compoſition, in the diſtillation of the ſame *Elixir*, the ſecond water may be given to a ſpoonful ſweetned, alſo the Bezoartick Water, *Aqua mirabilis*, *Gilbert*'s temperate water, Treacle and Cinnamon water, to each of which compounded or of themſelves, may be added *Confectio Alchermes*, *Confectio de Hyacintho*, powder of Pearls or the magiſtery of Coral, Syrup of Clove Gillyflowers, of Coral, of Citron peels, or of Cinnamon: Of theſe and others of this Rank, divers forms of Medicines are wont to be preſcribed, as for Example.

Take of Treacle water and *Aqua mirabilis* each ℥iij, of Balm water ℥iiij, of the Syrup of Clovegillyflowers ℥iß, of the Confection of *Alchermes* ℥j, mingle them: The doſe 3 or 4 Spoonfuls.

Or take of *Aqua mirabilis* ℥vj, of Snails and of Walnuts each ℥ij, of the Powder of Pearls ℈j, Confection *de Hyacinth.* ℥j, of the Syrup of Clovegillyflowers ℥j, mingle them.

When ſcorbutical Women are wont to be troubled with hyſterical Diſtempers, or Men with Convulſive; take of Balm and Pennyroyal water each ℥iij, the compound water of Briony ℥iiij, of the tincture of *Caſtor* ℥ß, of the tincture of Saffron

PHAR. Part. II.

℥j, of the Syrup of Clovegillyflowers ℥iſs, of *Caſtor* tyed in a rag and hung in the glaſs ℥j, the doſe is 3 or 4 ſpoonfuls.

For thoſe who had rather have Cordials in a ſolid form, Electuaries or Tablets are preſcribed.

Take of the Conſerves of Clovegillyflowers ℥iij, of the Confection of *Alchermes* ℥ſs, of the powder of Pearl ℥, with as much as will ſuffice of the Syrup of Coral, make an Electuary.

Take of the *ſpecies* of *Diamargarit. frigid.* of *Diarrhodon Abbatis* each ℥iſs, of Pearls powdered, of the beſt Sugar diſſolved in Treacle water, and boyled up to Tablets ℥iiij, of the oyl of Cinnamon 6 drops, make Tablets according to Art.

As to what relates to Opiates and anodyne Medicines, in ſome diſtempers of Scorbuticks, I had rather want the uſe of any other kind of Medicines beſides than of theſe, for indeed I have found by often Experience, that there is no better Remedy, not only againſt pertinacious pains and wakings, but in aſthmatical paroxyſms, in Vomiting, Fluxes, and alſo in the *Vertigo*, and in the Convulſive Diſtempers, as often as nature being irritated or provoked above meaſure, hath fallen into moſt cruel inordinations, than that Sleep might be allured by ſome ſafe Narcotick being given: In the mean time there is need of caution, that they be not taken when there is any thing in the conſtitution of the Sick, or in the condition or time of the Diſeaſe, that may forbid the exhibition of ſuch a Medicine.

Beſides the hypnoticks uſual in the Apothecaries Shops, *viz.* Opiate, *Laudanum*, *Nepenthe*, *Philonium*, *Diacodium*, and Syrup of wild Poppies, I know two preparations of *Opium*, which I am wont to give in the form of a Tincture or more liquid extract, with any other appropiate Liquor from 10 to 20 drops.

Diet or the manner of living, to be obſerved by Scorbuticks in the curatory method, is not of the leaſt moment, which being neglected or ill inſtituted, the other preſcripts of Medicine profit very little or nothing towards health: As the diætetick Rule extends it ſelf to various things, yet chiefly it is imployed about the Air, the ſoyl of the habitation, Meat and Drink, and the motion and reſt of the Body.

As to the firſt, what kind of places and manſions in reſpect of the Heaven and Soil, do breed the Scurvy, and therefore ought to be avoided, appears ſufficiently by what we have above declared. Thoſe who ſtudie to prevent or to cure this Diſeaſe, let them endeavour to choſe and Aire moderately hot and dry, and which ſhall be alſo thin and pure and ſufficiently eventilated or winnowed.

Meats only for good Juice and well cooked are convenient; heavy, ſlimy, putrefied, fennewed and meats dryed in the Smoak, alſo unfermented aliments, or greatly compounded, Pulſe, Milkmeats, and unripe Fruits are to be ſhunned, Sweat meats or things candied, or very much imbued with Sugar, I ſo much blame, that I am apt to think the Invention and immoderate uſe of them, to have contributed very much to the cruel increaſe of the Scurvy in this Age. For indeed that Concreet is made up of a Salt ſufficiently ſharp and Corroſive, though mitigated with Sulphur, as may plainly appear by a Spagyrical *Analyſis* made of it. For Sugar (as we intimated before) being diſtilled by it ſelf, yields a liquor, little inferiour to the Stygian Water: for if you ſhall diſtil it, being poured to a good deal of ſpring Water in a Bladder, although the fixed Salt does not ſo aſcend, yet it produces a Liquor like to the ſharpeſt *Aqua vitæ*, burning and highly pricking: Therefore as Sugar being commixed almoſt with every aliment, is ſo plentifully taken in by uſe, it is very likely that from its daily uſe, the Blood and the Humours are rendred ſalt and ſharp, and from thence Scorbutick. A very famous Author hath attributed the cauſe of the Engliſh Phthiſick, or Conſumption, to the immoderate uſe of Sugar among our country men, and I know no reaſon, but that I may rather think the increaſe of the Scurvy derives it ſelf from this enkindling.

Let the Drink be midling Beer, mild and clear, and altered with antiſcorbutick Ingredients, but without any ingrateful taſte; let it not be thick nor ſweet, nor too ſalt and ſour, and let it be taken in a moderate quantity and almoſt only at the ſet times of Dinner and Supper: That which with many is thought a good Cuſtom, to wit, that as ſoon as they are out of their beds, to indulge themſelves with (as they uſually ſay) a large mornings draught, ſeems to be very pernicious. For by this means, for that the ſanguiferous Veſſels are too much filled with the proviſion of freſh Chyle, almoſt perpetually poured in, both Crudities and morbifick Fæculencies are begotten in the Blood, and the office of Sanguification greatly weakned. It is better indeed for moſt men (unleſs ſuch, who whilſt they are empty and uſed to have their Ventricle grievouſly wrinkled and drawn together) to remain faſting till dinner, nor is it a leſs adverſary to health according to the uſual cuſtom, to fill themſelves

ſelves with drinking full Cups preſently after Dinner. Wines or Cyder ſo they be mild, right and not adulterated, and moderately taken, do not hurt; but there is nothing more hurtful and injurious to our health, than thoſe adulterated, ropie, ſharp and growing ſour.

Exerciſe and Labour is ſo very profitable, both for the curing and the preventing of the Scurvy, that many by this remedy only have recovered their Health, or preſerved it intire: For in thoſe leading an idle and ſedentary Life, the Blood and nervous Liquor like ſtanding Water contract a ſlimeneſs and muddy ſetlement: But by much and aſſiduous motion of the Body, the Humours and the Spirits grow clear and vigorous, the excrementitious and heterogeneous Particles evaporate, the ſtuffings of the *Viſcera* are diſcharged and their tone ſtrengthned.

CHAP. XI.

Some Hiſtories and rare Caſes of Scorbuticks.

WHAT we have thus delivered, concerning the Theory and the Cure of the Scurvy, ſhall be yet illuſtrated more clearly by examples of ſickneſs, or by Hiſtories brought to light and explained according to the aforeſaid *Hypotheſis*. As there are manifold and divers caſes extant of thoſe labouring with this Diſeaſe, we ſhall here propoſe ſome more rare, excited by reaſon of the Taint being affixed in the Brain and nervous Stock, no leſs than in the Blood. *Obſervation.*

A Gentlewoman, tall and handſome, about 25 years of age, had contracted the ſcorbutick Taint by reaſon of various errors in living, or manner of life, the ſigns of which were a ſpontaneous wearineſs, difficult breathing, pains and ſpots in her Legs, beſides her Gums ſwollen and bloody; in the ſpring time after miſcarriage falling into a tertian Feavour, ſuddenly ſhe became languiſhing and weak, from which diſeaſe, however ſhe had been quickly recovered, being at firſt methodically cured, but that greedy of fleſh and other incongruous things, ſhe ſoon fell into a Relapſe. But then growing weary of Medicine, ſhe took only empirical Remedies, by which ſometimes her Ague fits were driven away, then ſoon after they returned: In the mean time ſhe remained pale, weak as to motion, breathing ſhort and ſwollen, and blown up near the Ventricle and *Hypochondria*. About the third month of her ſickneſs ſhe began to feel cruel Pains and Torments in her Belly; which afflicted her almoſt continually night and day, running about, now at her Back, now in her Stomach; Beſides ſhe was affected ſometimes with hyſterical Fits, and with a frequent Vertigo, alſo being troubled with often Vomiting, ſhe daily caſt forth a clammy and frothy Flegme. Within a months ſpace this Diſeaſe diſplaying its ends, ſtirred up Pains in the Back, Loyns and then in every part of the Body. But at this time ſhe complained of a great ſtraitneſs of her Breaſt, and a great contraction of the *Viſcera*. In the mean time the habit of her Body became very lean, that the Bones being deſtitute of fleſh, the Skin could hardly ſtick on them. Her Urine was little and red, on whoſe Superficies was a little Skin coloured like the tail of a Peacock. A little time after this, ſhe felt a ſtupor or numneſs and a ſenſe of pricking, ſometimes in her Belly, and ſometimes in her Limbs, and then the Pains and Torments began to be remitted, but in their place a Palſie ſucceeded, which within the ſpace of a week ſo invaded the Members of her whole Body, that ſhe could neither bend her hand or foot or any other part, nor move one jot from the place.

As to the Ætiology or the reaſon of the aforeſaid caſe, this is plain that theſe more grievous Symptoms did wholly ſpring from a ſcorbutick Root; for by reaſon of the Taint being fixed chiefly in the Blood, the ſpontaneous wearineſs, the difficult breathing, and alſo the intermitting Feaver wavering and often returning, and other previous and as it were more light Skirmiſhes of Symptoms were induced: further, the lixivial Urine and of variety of Colours, plainly indicated or ſhewed, a Blood corrupted with a ſulphureous Saline dyſcraſie or evil complexion: which kind of Piſs by that means well known, I have taken notice of in ſeveral others affected with the like Diſeaſe. But when the morbid Seed in this ſick Gentlewoman, being plentifully increaſed, and flowing thorow the Maſs of Blood, did ſpread into the confines of the *The Reaſon.*

Brain

PHAR. Part. II.

Brain and nervous Stock, the more grievous diſtempers did then ariſe; to wit, the morbifick Matter, conſiſting of heterogeneous and irritative Particles, being depoſited within the Brain, brought in the *Vertigo* and Swimming, or turning round, and the ſpaſmodick or cramplike Diſpoſition; then a Portion of it falling upon the Nerves of the intercoſtal and moving Pair, and being by their paſſages caſt upon the meſenterick Foldings, ſtirred up the ſcorbutick Colick; and when the ſame matter being hugely increaſed, had come to many other Nerves, the painful Diſtempers were propagated almoſt into every part of the Body; for that the acid Recrements like to vitriolick *Stagmas*, being depoſited every where from the nervous Liquor, did incounter with the lixivial Salts, every where alſo poured forth from the Blood: Then laſtly when all the Nerves being by degrees filled and ſtuffed with the morbifick Matter, were ſo much obſtructed that the irradiation of the Spirits and their commerce were hindred, the Palſie followed upon the whole Body.

The Cure. This Gentlewoman living far from hence, had taken Medicines by the advice of a neighbour Phyſician, uſual againſt the diſtemper of the Colick; notwithſtanding which, when the Diſeaſe grew grievous, the Patient being brought to *Oxford*, made tryal of very many Remedies, both Antiſcorbutick and Antiparalytick almoſt of every kind and form, but without any benefit. Therefore after that every ordinary method of Curing, ſeemed not ſufficient for this Diſeaſe, it was thought good to proceed to great Remedies, and indeed not altogether free from danger: wherefore we adminiſtred to her, as ſick, weak and lean as ſhe was, a mercurial Medicine for ſalivation. The effect of which ſucceeded to wiſh, for the Flux at the mouth being riſen within two days, and perſiſting gently for many days without any evil Symptom, brought great eaſe to this Gentlewoman. For the Pains being mitigated, ſhe began to move a little her Members, and to deſire and to digeſt better her Food, and alſo to enjoy quiet Sleep. The Salivation being finiſhed, ſhe took a Decoction of Sarſa and China with Antiparalytick ingredients for a few days; then being carried to the Bath, ſhe there uſed for ſome time the more gentle and temperate Baths, and preſently recovered an indifferent ſtate of Health. All the Winter, ſhe conſtantly took Medicines againſt the Scurvy and the Palſy, and when the following year, ſhe repeated the uſe of the Baths, ſhe grew perfectly well, and afterwards became the joyful Mother of ſeveral Children.

Obſervation. A Man about 40, of a Melancholly temper, labouring for many years with the Scurvy, was wont to be ſenſible of divers and manifold Symptoms of it, at ſeveral times of the year. There appeared about his Thighs Spots and black large marks as if coming of ſtrokes; pains of the Belly, with a Looſeneſs often troubled him; his Urine for the moſt part appeared like Lye, and he almoſt conſtantly had a ſpontaneous wearineſs, a failure of his ſtrength, and a want of Appetite: Beſides theſe ordinary evils, and as it were cuſtomary, he lived obnoxious to moſt cruel Fits of Sickneſs, and thoſe of various kinds. Two years before, when I firſt ſaw him, he complained moſt grievouſly of a difficulty in Breathing, as if he were in danger to be choaked, with a trembling of the Heart, with a fainting of the Spirits, and of a conſtant fear of Swooning: Beſides, if any of theſe Diſtempers in the *Præcordia* ceaſed a little, for the moſt part an heavy giddineſs in the head, and *Vertigo* aſſaulted him. After that he had taken for ſome time Antiſpaſmodick and Antiſcorbutick Remedies mixed together, he ſeemed to be perfectly well; but then within a few weeks he was affected with a nauſeouſneſs and pain about the Heart, with an inflation of the *Hypochondria*; his Urine was little and very lixivial, and ſhortly after the *Abdomen* ſwelled up, and then his Feet and Legs with a great wateriſh ſwelling, ſhewed the ſigns of a growing Dropſy: afterwards the ſame Tumour invaded the fleſh of his Thighs, Arms, and Back alſo: which Diſtemper however though it ſeemed deſperate, was eaſily cured with antiſcorbutick Remedies, with the addition of Catharticks and Diureticks. But yet this remarkable perſon, although he was reſtored to health, did not continue ſo long: for two quarters of the year were ſcarcely paſt but he began to complain of a grievous Head-ach, with a *Vertigo* and a pertinacious waking, and then without any evident cauſe, he was taken with moſt horrid Vomiting: a little while after, his aſthmatical fits, with the trembling of his Heart and ſinking down of his Spirits, returned. Alſo at this time, when he almoſt ſeemed deſperate, he again grew well in a little while, with the uſe of antiſcorbutick Medicines. It plainly appears by this caſe, how many evils the ſcorbutick infection, like to Ferment lying hid both in the Blood and nervous Juice, and as occaſion ſerves, ſpreading abroad its Poyſon, can cauſe; which kind of diſtempers, how horrid and terrible ſover they ſeem, whilſt they depend only of the Humors vitiated in their Complexion, and that the *Viſcera* are not at all hurt in their Tone or Conformation, are wont to be cured moſt

PHAR. Part. II.

moſt commonly very eaſily, or without much trouble, *viz.* with an antiſcorbutick Method aptly deſigned, both according to the condition of the Patient, and of the Diſeaſe.

Obſervation.

A Lady about 25 years of Age, of a ſanguine Complexion, of a ſlender make of Body, of a fair skin and beautiful, had laboured for ſome time with the ſcorbutick diſtemper; for beſides broad ſpots and red ſwellings breaking forth in divers parts of her body, ſhe was wont to be troubled of a long time with cruel pains and torments, chiefly vexing her at nights, ſometimes in her Legs and ſometimes in her Arms: She had often begun to take Phyſick for the Cure, but being with Child was forced to give it over. After her laſt Child, for that ſhe had great fluxes, ſhe remained for many days languiſhing and weak, with difficulty of breathing, and upon any motion breathleſs. Being riſen up after lying in her month, and endeavouring to walk ſhe fell into a moſt grievous *dyſpnœa* or ſhortneſs of breath, with the trembling of the heart and a frequent fainting or ſinking of the Spirits: Being preſently put to Bed, yet trembling and with quick palpitations, ſhe continued ſo for almoſt a whole day; beſides her lower Members as if they had been dead, were altogether ſtiff and cold, and could not be made warm with the applications of warm cloaths or by rubbing: At length the night being almoſt paſt, ſhe found her ſelf better about her *Præcordia*, ſtrong Cordials having been often adminiſtred to her, but there ſucceeded a very acute pain on the top of her Thigh nigh to her left Groin, reaching even down to the Calf of her Leg, and within a few hours a hard tumour reſiſting the touch poſſeſſed all that ſpace. Being ſent for at this time whilſt the ſick was gaping for breath, a Clyſter being preſcribed and taken, I gave her 12 drops of the Spirit of Hartshorn, in a ſpoonful of the following Julap, ℥ij of the ſame being drunk afterwards. Take of the water of Snails ℥vj, of hyſterical water ℥iiij, of Walnuts ſimple and of Pennyroyal each ℥iij, of Sugar ℥j, of *Caſtor* tyed in a Rag and hung in the Glaſs ʒj. Theſe Medicines were repeated every ſixth hour. I took care to have a large Veſicatory to be applyed to the inward part of her Thigh, then in the evening for that ſhe had continued all this fit without any ſleep, I gave her j grain of *Laudanum*, of the powder of Pearls vj *gr.* of the Confection of *Alchermes* without Musk ℥ß: She ſlept quietly, and in the morning was very much refreſhed, the pain and tumour of her Thigh were ſomewhat abated, alſo while ſhe lay quiet in her bed ſhe was well at her *Præcordia*, but if ſhe ſat up or turned of one ſide, ſhe preſently ſeemed as if ſhe would expire with the *dyſpnœa* or want of breath. She continued to repeat the uſe of the Hartſhorn and Julap every ſixth hour for ſome dayes: but becauſe ſhe was oppreſſed with a troubleſome thirſt, and that her Urine was little and the Contents red and high coloured, ſhe took a doſe to ʒvj, twice aday of the following *Apozem.* Take of Graſs Roots, Chervil, *Eringo*'s preſerv'd, each ʒvj, of the ſhavings of Ivory and of Harts horn each ʒij, of Hartshorn burnt ʒjß, of Raiſins of the Sun ℥ij, 1 cut Apple, of Liquoriſh ʒijß, being cut and bruiſed let them be boyled in 3 pints of Spring water, to the conſumption of the third part; then add of Whitewine ℥iiij, let it be ſtrained into a Jugg, to which put of the leaves of Scurvygraſs and of Brooklime each *m.* j, of the Salt of Wormwood ʒij, make an Infuſion cloſe ſhut and warm for 3 hours, being ſtrained let it be kept in cloſe Veſſels: Sometimes every day, ſometimes every other day they gave her Clyſters. By the daily uſe of theſe ſhe ſeemed to be better, ſo that within the ſpace of a Week ſhe was able, being raiſed from her bed, to ſit up in a Chair by the fire ſide for 2 or 3 hours: But if ſhe ſat up a little too long, or did but endeavour to ſtir, ſhe preſently fell into an aſthmatical fit or *dyſpnœa*; ſo that one day having ſtayed ſomewhat longer out of her Bed, having ſuffered a moſt heavy aſſault of the Diſeaſe, ſhe was afflicted with a difficulty of Reſpiration, with a trembling of her whole Body, and continual ſinking of her Spirits: By reaſon of this Relapſe of the ſick Lady, at laſt I being ſent for, gave her 20 drops of the Spirit of Hartshorn with the above preſcribed Julap, and at night a doſe of our *Laudanum*; but when ſhe began to be better about her *Præcordia*, the pains and tumors ſucceeded in her right Thigh and Leg as had happened before in her left: I alſo ordered a Veſicatory to be applyed to that Thigh, and beſides the Remedies hitherto cited, ſhe took twice aday of our Wine of the Juice of Scurvygraſs ℥iiij, with ℥ij of the magiſterial antiſcorbutick water. Beſides I ordered a Purge of our ſolutive Syrup above preſcribed, which ſucceeded ſo well, that I repeated it again within 3 or 4 days. With theſe Remedies ſhe grew well within a Month.

The Reaſon.

As to the Reaſons of the Symptoms obſerved in the aforeſaid caſe, firſt it is obvious from the ſpots and pains of the Limbs, that the Blood and nervous Juice had been for a good while touched with the ſcorbutick taint, which notwithſtanding lay hid within the aforeſaid humours, as it were ſubjugated and without any ſignal evil,

ſo

PHAR. Part. II.

ſo long as they were ſtrong in the Vital and Animal Spirits: But after the great hæmorrhage or Flux of Blood, when the Blood and nervous Liquor grew weak in their *Craſis* or Complexion, the particles of the morbid ſeed like to ferment, being moved, ſtirred up thoſe terrible diſtempers: That grievous *Dyſpnœa*, or want of breath, ſeemed to ariſe from a double cauſe, or a concourſe of a double evil, to wit, becauſe certain pneumonick Nerves being beſet with the ſcorbutick matter, were hindred as to their office of Reſpiration: For from hence there was a neceſſity that the Lungs ſhould be ſwiftly moved, that they might draw the Blood from the heart, and the act of Reſpiration being more weak by reaſon of the Nerves being hindred, it became therefore more ſhort and very laborious: A fit of the *Dyſpnœa* urging, when as the Blood about the *Præcordia* was very much agitated, the extreme parts (which were then almoſt wholly wanting) by reaſon of its abſence grew ſtiff and cold; afterwards when as the Spaſms or Convulſions of the Lungs abated, that the Blood being greatly embued with the morbifick matter, which it had there ſupped up, looſned from its ſtagnation, was returned to Circulation, that ruſhing impetuouſly into her Thighs, firſt into her left, then into her right, the other being deſerted and ſo overflowing its Channels, being extravaſated with the ſerous filth, cauſed that ſudden tumour with the red ſwelling. But by reaſon of the ſhifting of the morbifick matter into the more ignoble paras to and again, the Diſeaſe though it ſeemed very dangerous, eaſily gave way to Remedies, altering the dyſcraſies or evil diſpoſitions of the humours, and gently carrying away the Reliques of the morbifick Mine.

Obſervation. A Noble gentleman about 33 years of Age, of a ſanguine Complexion as he ſeemed to be, tall and ſlender, of a very ſharp wit and great underſtanding, although he had exerciſed himſelf very much for a long time in immoderate and unſeaſonable ſtudies, together with an inordinate way of living, yet to that time being freſh and full of vigor, he ſeemed to enjoy a whole mind in a ſound body; a little more than two years before, when he had very much tyred himſelf in dancing a whole night amongſt his Gueſts, in the morning going into a cold Bed in a Chamber ſomewhat moiſt, deſirous of a little Sleep he began to be Sick; for being awaked he fell into great perturbations about the *Præcordia*, with great fainting of the Spirits: After having taken a draught of Wine and ſome Cardiack Remedies, he was ſomewhat better; but by and by he relapſed, ſo that both himſelf and his friends feared all that day a mortal ſwooning or an imminent Apoplexy. But after this Aſſault of the Diſeaſe had paſſed over, he lived after that ſtill obnoxious to daily paſſions of the Heart, and upon any more great error in living, he was wont again to be troubled with moſt grievous fits. Notwithſtanding the uſe of Remedies, the Diſeaſe encreaſing upon him within a few Months, it not only infeſted the *Præcordia*, but in the whole habit of his Body, Suffuſions ſometimes of cold ſometimes of heat, and beſides a *ſtupor* or numneſs, or ſenſe of tingling or pricking, or light and ſudden Convulſions or Contractions in his Limbs were excited: And of late beſides theſe Symptoms ſpoken of already, which although they were very grievous to this Noble Gentleman, yet he was further troubled after a terrible manner with a frequent *Vertigo*, and with diſtractions and decay of the Spirits, that inhabit the forepart of the Brain, inſomuch that he was forced to abſtain from Studies and Political Affairs (to which he was always addicted) yea and from every more ſerious intention of the Mind; for otherways he felt thoſe ſort of perturbations both in the Head and in the Nervous Stock, that made him fear an Aſſault of the aſtoniſhing Diſeaſe, or moſt horrid convulſive Affections: Whilſt he had the more grievous Fits of this Diſeaſe, his Ventricle alſo was diſturbed for the moſt part, but he often received eaſe by Vomit, either by the free aſſiſtance of Nature, or by the help of an emetick Medicine. Hence ſome thought the cauſe of the Diſeaſe, to ſubſiſt altogether about the Stomach or the *Hypochondria*, but Catharticks, Emeticks, Digeſtive, Cephalick, Anti-ſcorbutick, Chalybeate, and other Medicines almoſt of every kind, preſcribed him for two years by the moſt famous Phyſicians, and alſo by Empiricks and Quacks, profited little towards the Cure of the Diſeaſe. Of late having tryed *Aſtrop* waters, he found himſelf worſe for the uſe of them, preſently deſiſting, he was next adviſed to be carryed to the ſulphureous waters at *Knaſborough* in *Yorkſhire*, but with what ſucceſs I have not as yet learned.

This caſe becauſe by reaſon of the Concourſe of various Symptoms, it can belong to no other kind of Diſeaſe beſides, it is not undeſervedly referred to the Scurvy; for it may be ſuſpected that the procatarctick or Remote Cauſe of this Sickneſs, lay in the evil diſpoſition of the Blood, to wit, that its Liquor was degenerated from a Balſamick and a ſpirituous, into a ſharp and ſulphureous-ſaline, by reaſon of theſe Elements being carried up above meaſure, which indeed ſeems to have happened partly from Errors in living, for that this Noble Perſon being often kept by buſineſs or more

ſerious

ſerious Studies even till Midnight, was wont to ſup at that time, and preſently to go to bed to ſleep: Further, this Diſeaſe did partly ariſe from a ſickly diſpoſition of the Spleen, and perhaps of the other *Viſcera*, ſupplying the Blood with a morbid ferment, neither is it altogether without reaſon, that we judge the Spleen ſhould be accuſed. PHAR. Part. II.

The Reaſon. The Blood labouring with the aforeſaid Dyſcraſie, and from thence gathering together heterogeneous Recrements, eaſily poured the ſame on the head, being helped by the evident cauſe: Wherefore when the Brain by reaſon of immoderate and untimely ſtudies, being ſomething debilitated became leſs ſtrong to reſiſt the evils, and when for that occaſion before cited, the bloody Maſs being carried up into a greater ebullition, the pores of the whole Body being by and by ſhut up, it could not be ſo well eventilated, its great ſuffuſion or ſpreading into the head brought on the firſt manifeſt ſickneſs, to wit, from the Blood too much heaped up about the region of the Head, firſt the ſwelling up and *Phlogoſis* or inflammation of the Face came: Further, from the ſame at that time imputeouſly ruſhing on the borders of the Brain, and there ſtagnating the heterogene Particles, partly Narcotick, partly exploſive, fell down into the Origin of the Nerves, which being ſo beſet with incongruous matter, thoſe perturbations ſtirred up about the *Præcordia*, (for the Reaſons ſhown in the ſpaſmodick Pathology) did ſucceed. Further, for as much as the ſame matter being dilated towards the hinder part of the head, coming upon the Nerves, ariſing from the ſpinal marrow, it invaded the extreme paſſages and proceſſes of them all, and ſtirred up through the whole Body, a *ſtupor*, pricking, and the lighter Cramps or Convulſions. Moreover, becauſe the Nerves and their branches compaſſing about the ſanguiferous Veſſels, being affected with Convulſions were variouſly contracted, thoſe ſudden diffuſions or ſpreadings of heat and cold, by reaſon of the Bloods being as it were ſometimes reſtrained with a Bridle, and ſometimes agitated forward with a Spur, did ariſe through the whole Body.

About the beginning of the Diſeaſe, becauſe the morbifick matter being ſuggeſted from the Maſs of Blood, breaking forth firſt either on the Region of the Cerebel, or if admitted into the Brain, being from thence preſently ſent forth, it fixed chiefly about the original of the Nerves, therefore the chief taint appeared in the nervous Appendix, and about its exteriour proceſſes without any *Vertigo* or previous ſwimming or Scotomy, or any notable hurt in the chief powers of the Soul: But afterwards by reaſon of the dyſcraſie of the Blood being daily encreaſed, and the conſtitution of the Brain or *Encephalon* being more weakned, the heterogeneous Particles alſo breaking through into the anterior Brain or the regal Palace of the Soul, they brought on both the diſtractions and meltings or ſinking down of the Spirits inhabiting there: So that this Diſeaſe after that its Roots being once planted ſomewhere within the *Encephalon*, did daily ſhew its intentions, notwithſtanding the uſe of Medicines, as that at firſt only the original of the nervous wandring pair, and the intercoſtal were infected, and then afterwards the morbifick matter entred into the proceſſes and interior paſſages of the other Nerves of the whole Body, which being filled full, at length that being carried by the as yet impure Blood into the Brain it ſelf, it poſſeſſed its more noble Cells, which kind of Cephalick Diſtempers, I have obſerved to have made the like progreſs in many, ſo that it plainly appears theſe Symptoms excited by ſuch a *Series*, ariſe by reaſon of the aforeſaid Cauſes, and not from Vapours ſuppoſed to be elevated from the *Viſcera* or Inwards.

But that a fit urging oftentimes the Ventricle was diſturbed, alſo that it was wont to be ſuddenly eaſed by Vomit, it will not be difficult to ſhew the reaſons without prejudice to this *Hypotheſis*. As to the firſt, there is nothing more plain than that the Ventricle is ſubverted, and that a nauſeouſneſs or Vomiting doth ſucceed, by reaſon of ſome grief inflicted on the Origin of the Nerves, as we have at large already declared, then there is more reaſon for that Vomiting ſhould bring preſent help: For in the firſt place, as the Nerves of the wandring pair and the Intercoſtal are very much ſhaken, (as it is the manner of the Nervous Parts) they preſently remit their mordinations excited from an internal cauſe, as an itching or pained member is freed from grief if it be ſcratched or rubbed. But the aforeſaid Nerves being greatly ſhaken together and contracted in Vomiting, they eaſily ſhake off the morbifick Matter, fixed to their ends or extremities; by which it comes to paſs, that oftentimes a ſharp or acid Matter, or otherwiſe infeſtous, being heaped up within the firſt Paſſages, and there either infecting the Blood, with its hurtful Ferment, or irritating the nervous Bodies, into Convulſions, is brought away by Vomit, and ſo the Fountain or Provocative of the Diſeaſe is carried forth.

PHAR. Part. II.

As to the therapeutick or curatory Method, to be used in this case, and others like it, there are two intentions which are chiefly to be insisted on, *viz.* In the first place to make pure the Mass of Blood, and to bring away the noxious Ferment administred from the Ventricle, Spleen, and other *Viscera*. Secondly, that the Brain and nervous Stock be strengthned, lest they admit of extraneous Particles: and that the nervous Juice watering those parts, degenerating from a right into acetous or otherwise morbid *Crasis*, may be rectified and restored. The first of these are to be performed by Cathartick, Emeticks, Phlebotomy, and chiefly by specifick Medicines, correcting the scorbutick Taint of the Blood, or carrying it quite away: But as to this Iron or Vitriolicke Spring, celebrated for the purging the Blood, that they were rather hurtful than helpful to this Gentleman, the cause seems to be, both for that the Brain being made weak by reason of those Cephalick Distempers, hardly excluded the filth of the Water sent from the Blood, but was in danger to be overflown, by its falling more furiously upon its Confines; and also because when the nervous Liquor degenerating from its *Crasis*, turns sowr, it is wont to be more preverted by the fluid Salt of those purging Waters. Wherefore we have still observed, that the drinking those Waters, in a Rheumatism and the Gout, hath increased the morbid Disposition. The second intention is best instituted by cephalick Remedies, and chiefly those indued with a volatile Salt, of which sort are Spirits, and Salt of Blood, Soot, and Harts-horn, of the Roots and Seeds of Peony, the leaves of Misletoe, *&c.* With which Antiscorbuticks may be mixed.

FINIS.

THE TABLE

To the First Part of PHARMACVTICE RATIONALIS.

A

*A*Ffections, *Description, and Uses of the Parts in which Medicins begin first to operate.* pag.3.
Anatomical description of an Artery. p.123.
Anodinous Medicins their distinction. p.137.
Antimony, wherein its vomitive power consists. p.25.
Crude Antimony no Vomit, how the particles of it become a Vomit. ibid.
Its various Preparations. ib.
As Glass of Antimony, and the reason thereof ib.
Flower of Antimony, and its reason. ib.
Crocus Metallorum. p.26.
And the reason of it. ib.
Sulphur of Antimony how to prepare, and the reason of it. ib.
It is a Composition of Antimony and common Sulphur. ib.
The reason of the Preparation. p.27.
Its Correction. ib.
Antimony Diaphoretick. p.92.
Antidotes and Cordials have always been of most common use. p.104.
Their common Attributes. ib.
Whence Remedies that preserve Life, are so called. ib.
They act not properly on the Heart, but on the Bloud and Animal Spirits, and how on the Bloud. ib.
They are requisite when the Blood is too loose p.106
Antidotes preserving and curing. p.112
Opiates, why called Antidotes. p.132
Aptness to catch Cold. p.97
The Reason. p.98
Its Original. p.99
Cure. ib.
Arteries are endued with moving fibres, and are moved like other Muscles, or the heart it self. p.116
Are often troubled with Convulsions. ib.
Their Anatomical Description. p.123
They have four Coats according to Galen, ib.
Their use. p.124
In an Artery the Plat of Vessels above the Muscular Coat, is otherwise in the Viscera, and the reason. ib.
Aurum Vitæ. p.29

B

Bezoarticum Minerale, its preparation, and reason thereof. p.91
Bloud, that it might rightly separate the Serum, it ought to be kept from being too thick, or too thin. p.63
Faulty in its heat and temperature. p.105
how it becomes less hot than it should be ib.
Being irritated in its temper or mixture, it requires Cordials onely in Fevers. ib.
And then it is either too strict or close in its constitution, or too loose. ib.
What remedies the latter fault requires p.106
Bovius's *Hercules.* p.29
And the reason of the Preparation. p.30
His Epicæne, or common Menstruum of both kinds. p.30

C

Catalogue of all Narcoticks. p.137
Cause of the frequent motions in Purges. p.39
Ceruse of Antimony. p.92
Coffee and its effects. p.142
The reason of it. ib.
Its conveniences, and inconveniences. p.143
It makes People lean and paralytic, &c. ib.
Common Precipitate Mercury. p.28
The reason of the preparation, and why it grows red in this case. p.29
Composition of Antimony ond common Sulphur. p.26
The reason of its preparation. ib.
Its correction. ib.
Convulsive motions in Muscles explained and distinguished. p.119.
Some private Convulsions belong to them only. ib.
Two sorts of them. ib.
The latter a kind of trepidation in a Muscle, p.120
Its true reason. ib.
Their Causes not rightly imputed to the Spleen ib.

Contractions performed by fibres onely. 4
Cordials and Antidotes, have always been of more common use. 104
When Remedies that preserve Life are so called. ib.
They act not properly on the Heart, but on the Bloud and Animal Spirits. ib.
How on the Bloud. ib.
They are required onely in Fevers, the bloud being vitiated in its temper or mixture, as being either too strict and close in its constitution, or too loose; what the latter requires, and what the first. p.106
Salt Cordials of different sorts. p.107
Some impregnated with volatile Salt. ib.
Some with an Alcali, or petrifying Salt. ib.
Some have a fluid, or sower Salt, or a fixed Salt in them. ib.
Or a nitrous Salt in them. p.108
Which are all more properly called Vitals. ib.
How when taken into the Stomach, they presently operate upon the Bloud. ib.
Cordials that respect the Animal Spirits ib.
Are of two kinds, smooth and gentle to the spirits. ib.
And how they work upon the Bowels, or Senses, or Brain: or they are rough or provocative, which reduce the spirits to order, by as it were lashing them. ib.
Cordials, their several sorts and Receipts. p.110
Of such as increase the heat of Bloud. ib.
Their abuse. ib.
Of such as allay its excessive heat. p.111
Of such as open the Constitution of the Bloud, whilest it boils up, and is too close. ib.
Of such whose ground is a volatile or alcali Salt. ib.
Nitrous Cordials, and such whose ground is an acid, or fixed Salt. p.112
What Cordials most proper in Pleurisies. ib.
Crocus Metallorum, *and the reason of its preparation.* p.26

D

Description, uses, and affections of the Parts in which Medicins begin first to operate. p.3
Diabetes, its description. p.71
Formerly rare, and is not yet well known. ib.
Proceeds not from the attraction in the Reins, but rather from a fusion in the Bloud. ib.
Its immediate cause, chiefly in the Bloud. p.72
Sometimes partly in the Reins. ib.
Most commonly it proceeds from the dissolution of the Bloud. ib.
Its original cause. p.73
How it and a Dropsie differ. ib.
Its evident causes. p.74
Its symptoms explicated. ib.
Its prognosticks p.75
Indications of cure. ib.
Stories. p.76
It proceeds from the same cause as the English Sweat. p.103
Diacodiates. p.138
Diaphoreticks, what are their Forms. p.87
Such as have the Integral parts of a mixed Body for their Basis. ib.
The Receipts of them. ib.
Those that are easily got. p.89
Forms of Chymical Diaphoreticks. ib.
Such as have spirituous particles for their foundations, and such as have spirituous particles united with others. ib.
Those whose Basis is Salt, fixed, or volatile, or nitrous, or acid Salt. p.90
Sulphurous Diaphoreticks. p.91
Dogs-Tongue, its preparation. p.140
Dropsie, how it and a Diabetes differ. p.73
Dysentery of London. p.51
Two sorts thereof. ib.
Its cure. ib. & 54,56
The reason thereof, p.52
Its remove causes. p.53
Why Autumnal and Epidemical. ib.
Its first and evident causes. ib.
Its description. p.54
An irregular Fever useth to accompany it. ib.
Three things concur to cause it. p.56
Its Stories. p.57,&c.
An unbloudy Dysentery proceeds from the same cause as the English Sweat. p.103

E

Evacuation by Stool, what moves it. p.38
Expansions caused by nervous fibres. p.4
Examples of strong Purges. p.42
Extract of Black Hellebore. p.49

F

Fallopius *his opinion of the motion of the Membranes.* p.4
Fibres, Membranes, Vessels, and Passages, the second subjects upon which Medicins work. p.3
Flower of Antimony, and the reason of its Preparation. p.25
Of Sal Armoniack. p.92
Forms of Diuretricks. p.64

G

Galens *Anatomical Description of an Artery.* p.123
Its Coats, according to him, are four. ib.
Glass of Antimony, and the reason of its Preparation. p.25
Guts, they have three Coats. p.10
How fastned to the Mesentery. ib.
Their Use. p.11
Their motion whence it proceeds. ib.
Their natural expulsive motion, how performed. p.36,37.
How excited. ib.

Hairy

H

Hairy Vail, its uses, p.5
Heart, its indispositions, are either a trembling, or a beating of it, p.114
The latter described, and its cause inquired into, ib.
It depends oftentimes upon the indisposition of the Bloud, and vessels belonging to the Heart, p.115
How it is a convulsive Distemper, p.116
Whence it often arises, ib.
Why this Disease is familiar to Hypochondriacal People, p.117
Its Cure, by what means procured, when the Bloud is in fault, ib.
How it ought to be dealt withal when it ariseth from an obstruction. ib.
Its cure when it arises from Convulsions in the Arteries, p.118
How the Hearts trembling differs from its Palpitation, ib.
Its trembling described, it depends upon the doctrine of the Muscles, ib.
The Heart not disturbed by vapours, p.120
Among the Hearts distempers, an intermitting Pulse may be reckoned for one, p.121
Helmonts Laudanum, p.140
Histories of the efficacy of Opiates, p.132
Humours, their several sorts, p.2
How Medicins operate on them, ib.
They and the Spirits are the first subjects upon which Medicins work, p.3

I

Indications of Vomiting, p.23
Indispositions in the Heart, are either a trembling, or the beating of it, p.114
The latter described, and its cause inquired into, ib.
It depends oftentimes upon the Indisposition of the Bloud and vessels belonging to the Heart, p.115
How it is a convulsive Distemper, p.116
Intermitting Pulse may be reckoned for one among the Distempers of the Heart, p.121
Two sorts thereof, ib.
The first by default of the Aorta, ib.
The second from the Heart it self, p.122
Not always an ill token, ib.
Its several sorts, ib.
Its cause, ib.
How to know when it is coming, ib.
Its cure, ib.

L

Lasks symptomatical, what is to be done in them, p.50
Laudana, or Opiates invented by the Modern Doctors, p.139
Laudana in the Form of an Extract, ib.
Liquid Laudana, ib.
What is the best Menstruum to make Laudanum with, ib.
Helmonts *Laudanum,* p.140
Laudanum extracted, p.142
Liquid Laudanum lactarized, ib.
Liquid Laudanum prepared with Quincer, ib.

M

Medicins, an account of their operations wanting, p.1
Their Mechanical reason inquired into, ib.
The places where they begin to operate, ib.
The Subjects on which they operate, ib.
How they operate upon the Spirits and Humours, p.2
In every kind of Medicin are three things to be observed, ib.
Medicins causing sleep, 125
Hindering sleep, 142
Stopping excessive pissing, p.77
Against excessive Purging, p.50
Excessive vomiting, p.31
Membranes, Fibres, Vessels, and Passages, second subjects for Medicins to work upon, p.3
Menstruum of Bovius *his Hercules, and the reason of it,* p.30
The best Menstruum to make Laudanum with, p.139
Milk, how to hinder its curdling, p.61
The Reasons shewed, p.62
Mercurial Medicins how they work, p.27
Upon the Stomach, p.29
Mercury, or Quick-silver not purging or vomiting of it self, p.27
How made to operate, ib.
Precipitated by it self, how prepared, and the reason of its proceß, p.28
Precipitate Solar, how made, and the reason of its preparation, ib.
Common Precipitate with corrosive liquors, and the reason of it, ib.
Mercurius *Vitæ, and the reason of its Preparation,* p.27
Its correction, ib.
Mercurius Dulcis, *and corrosive Mercury sublimate, how prepared, and the reason of both,* p.48
Method of this Treatise, p.2
Minerals, some of their Medicins not properly called Purging, p.44

N

Narcoticks, A Catalogue of all of them, p.137
Their grounds, p.141
Nerves, to what end so many are inserted into the Coats of the Arteries, p.116

O

Opiates, Four things to be inquired into concerning their Nature, p.125

How they work upon the Animal Spirits, ib.
In what ſort of Particles their virtue conſiſts, p.126
In what places they work primarily and chiefly, ib.
When they kill the outmoſt ſpirits, they make the next to them white, ib.
And leſſen or recall the afflux of them, p.10
The nervous parts, ib.
The reaſon thereof, p.127
How far and into what parts their Virtue is extended, ib.
They poiſon not the Bloud, as they do the Spirits, ib.
They work chiefly upon the Animal Spirits, p.128
Sometimes their force reaches the Cerebellum, ib.
Their good and bad effects, ib.
The good reſpect either the Spirits, or Bloud and Humours, ib.
Good for the Spirits, in reſpect to ſenſe and motion, ib.
To both in a different kind, ib.
In reſpect of the inward ſenſes to Watching and Madneſs, ib.
In reſpect of the external ſenſe for pain, p.129
How they remove Pain without ſleep, or after it, ib.
The reaſon thereof, p.130
They remove Convulſions, for the ſame reaſon, ib.
They are good in the Gout and Stone, ib.
How they cure irregularities of Motion, ib.
They diminiſh the vehemency of the Pulſe and reſpiration, ib.
They regulate the diſorders of Reſpiration, p.131
How their Particles work upon the Bloud, ib.
They ſoon paſs through the Bloud, ib.
Therefore are called Antidotes, p.132
They cauſe Sweat and Urine, ib.
Notable Hiſtories of their Efficacy, ib.
Opiates of the Ancient, p.138
Opium, how many and by what way it hurts us, p.133
Its poiſon works firſt upon the Brain, and then upon the hinder part of the Brain, ib.
Hurtful to the Head, Breaſt, and Belly, p.134
How it works upon the Turks, ib.
What hurt it doth the Breaſt, ib.
What to the Belly, p.135
Medicinal cautions concerning its uſe, in reſpect of the Patients conſtitution, of the Diſtemper of the Animal Spirits, and the Bloud and Humours, ib.
Its Nature and Parts, p.137
In what its power conſiſts, ib.
It works not the ſame way in all, ib.
Hurts not a Dog, as it doth a Cat or a Man, ib.

V

Vessels, Fibres, Membranes, and Passages are the second Subjects upon which Medicins work, p.3
Vessels and Passages belonging to the Guts, p.12
Vomits, what Fibres perform its business, p.15
Vomiting is a Convulsion, p.16
How it differs from other Spasms, ib.
Its immediate cause, ib.
How Vomiting moves the Spirits, ib.
Its remote and chief cause, p.17
Provocatives to Vomit, are either taken in at the mouth, or generated in the Stomach, or sent from some other part, ib.
The Vomitive matter comes through the Nerves too, p.18
Vomiting by consent of what parts it comes, ib.
Causes of Vomiting, p.19
Vomits, how they work, p.20,21
The stronger Vomits are next to poison, ib.
Why Intervals in Vomiting, p.21
Vomits not easily stopt, ib.
Why they work sooner in some, p.22
How they work in a solid Form, ib.
They work not alike in all Doses, ib.
Nor by a specifick virtue, ib.
Nor upon peculiar Humours, ib.
If convenient, they are better than any other Physick, p.23
They are to be used with caution, ib.
Their Indications, ib.
Their Receipts, p.24
Immoderate Vomiting proceeds either from an Emetick Medicin, or other causes, p.31
The reasons of the former explained, ib.
Its Cure, ib.
Natural Vomiting is either Critical or Symptomatical, ib.
The latter is either Idiopathetical, or affecting one proper part; or Symphathical, affecting two by consent. p.32
How Vomiting that arises from a vitiated Stomach is to be cured ib.
Vomiting caused by weakness of the Stomach in two cases; either the Fibres are too much relaxed; or the Nerves are obstructed, so as the Animal spirits cannot flow into them, p.33
The Cure in the former case, ib.
The Cure in the latter, p.34
Urine, what its matter is, and whence it comes, p.59
It is threefold, ib.
Its matter proceeds chiefly from the mass of Bloud, p.61
Its suppression proceeds from the compactness of the Bloud, p.72
The same confirmed from Anatomical Observations, ib.
Why sweet like Honey in a Diabetes, p.74
Uses, Descriptions, and Affections of the parts in which Medicins begin first to operate, p.3

W

Water and Syrup of Rhead Poppy, p.141
Weazon, it hath three Coats, p.3
The inner Coat is nervous, but covered with a kind of Doun, ib.
It goes into the mouth of the Stomach, and covers it for some space, and creates a sense of tasting in the Weazon and mouth of the Stomach, ib.
The second Coat hath two opposite ranks of Fibres that cause motion, ib.
The third and outmost is common to it and the Stomach, &c. ib.
The uses of these Coats inquired into, ib.

Y

Yawning how performed, p.4

THE

THE TABLE

To the Second Part of PHARMACVTICE RATIONALIS.

A

Air, its faults, p.21
Its defect hurting breathing proceeds from the Pneumonick Organs, ib.
Its influence for exciting a Consumption, p.32
Grosser and City Air to some consumptive persons healthful, to others hurtful; the reason thereof inquired into, p.33
A sulphurous Air healthful to some Consumptives, ib.
Anasarca, its description, p.116
How it differs from an Ascites, ib.
Its original from the Bloud, ib.
Its material and efficient causes, ib.
Its material cause is partly the Serum of the Bloud, and partly the nutritious juice, p.119
Why the Hydropick Humour is lympid, and not milky, or bloudy, ib.
The differences of this Disease, ib.
Its Prognosticks, ib.
Its Cure, p.120
The Indications and Intentions thereof, ib.
Strong Purgers convenient, but not to all, ib.
The manner of their working in this Disease ib.
Chalybeats profit much in this Disease, but they are onely those endued with Sulphur, p.124
Artery Pneumonick, its description and use p.6
Artery pricked, why so dangerous, p.131
Aspects of the Moon and Stars of no moment in Phlebotomy, p.132
Ascites, its more remote causes, p.98
It proceeds not always from the Liver and Spleen, ib.
The Humours by which it is produced, are first the Bloud, then the milky and watry Humour, p.99
It is often the product of the Jaundies, ib.
Two kinds of it, p.100
Its description and differences, ib.
Prognosticks, p.101
Cure, ib.
John English *his Empyrical remedy in this Disease,* p.105
Asthma, a most terrible Disease, p.78
Its evident cause is what ever causeth an effervescency of the Bloud, p.79
Asthmatical persons, why worse in Bed, ib.
A Convulsive Asthma, ib.
Its morbifick matter, ib.
A mixt Asthma, p.80
Causes of an Asthma recited, ib.
Prognosticks, ib.
Cure, ib.
What to be done in the fit, p.81
Cause of its ending in a Tympany, p.111
Atrophy denoted by the word Phthisis, p.25
An Atrophy first depends on the Bloud made unfit to nourish, ib.
Its consumptive discrasie is either from it self, or communicated from other parts, ib.
The first proceeds sometimes from a fault of the Bowels, or solid parts, or from the nervous juice, p.26
The said Juice of it self sometimes the chief cause, ib.
Two chief kinds of Atrophies, ib.
The Authors Opinion concerning Bloud fermenting in the Lungs, p.17
Of the cause of the Jaundies, p.90

B

Belly why it swells in those that die of a Timpany, p.109
Bloud hindred in the Lungs, sometimes because not kindled enough, sometimes too much, or through its temperament being vitiated, and when too much loosened in its consistence, p.18
Why it lodges the Serum in the Lungs: and its various causes and ways of doing it, ib.
Bloud dissolved lodges infections in the Lungs that cause corruption, p.19
How stopt in the Lungs by fault of the heart ib.
An Atrophy first depends on it, made unfit to nourish, p.25
Its consumptive Discrasie, whence? ib.
Its ill temper disposes to a Consumption, p.30
Whence its ill temper comes, p.31

What affection of the Bloud produceth a Peripneumony, p.58
Things diſtilling its clammineſs, p.62
Bloud the efficient cauſe of an Anaſarca in a double reſpect, p.116
Its Hydropick temper ſprings from a double reſpect, p.117
Blood-letting, vide *Phlebotomy.*
Breſt Dropſie eaſily known, p.85
Its cauſe hidden, ib.
How many ways it may be produced, ib.
Its cure by a Paracenteſis, p.86
Breathing, its actions concluded to be mixed, viz. *animal and natural,* p.12
Hurt by the vitious qualities or defect of the Air. 21. V. *Air.*
Bronchia, p.4
Their Syſtole and Diaſtole, p.5
Their Lobes, ib.
After what manner their ſtreightneſs ariſes, p.78

To the most Reverend Father in God

GILBERT

(By Divine Providence)

Arch-Bishop of Canterbury,

Primate and Metropolitan of all *ENGLAND*, and one of the Privy Council to His Sacred Majesty *CHARLES* the Second, King of *Great Britain*, *France*, and *Ireland*, &c.

Most Renowned Prelate,

IN that I still become troublesom to your greater Cares, by this Kind of often repeated Duty, I must also repeat my former Excuse. For that these my VVritings, with those formerly Published, for the most part consist of those things which I have delivered in my Academical *Readings, by a necessitated Duty belong to you, for that I received them from your Favours; and indeed, neither these had ever seen the Light, nor perhaps my self had ever been in the number of Authors, unless I had been made at first your* Sidlie *Professor at* Oxford; *yours I say, both for the ancient Honour with which you had advanced me, and also for the more fresh magnificent Liberality, which has obliged the whole* Academy, *and all its Gowned Company. All the Schools partake of what is imputed to your* Theatre; *and moreover all the Professors, whilst every one of their private Patrons are acknowledged, Celebrate* Sheldon; *who exceeds, by your gifts that of other* Mecænatuses, *and Crowns the whole.*

But as these Disquisitions are indebted to your Munificence, so they require your Patronage, and we offer them not more in Duty to your Grace, than for the Cause of your

Tutelage. Concerning the Soul, I have enter'd upon a great and difficult thing, and full of hazard; where we may equally fear the Censures of the Church, as the Schools. For that I assert a Man (as the Mad-man in the Gospel possest with a Legion) to be indued with many distinct Souls, and design sometimes a legitimate Subordination of them, and sometimes wicked Combinations, troublesom Contests, and more than Civil Wars; yea, and in that I importunately describe, the Manners and Affections, the Mutual Exaltations, Dejections, and Productions of either, and their state after Separation: These, I say, some not only Philosophers, but Theologists perhaps may find fault with. And althô I have a place of Safety, in that the Arguments and Reasons fight on my Side, and that I have got the Suffrages of the ancient Philosophers, and the holy Fathers (and especially of St. Hierome *and* Augustine, *and among the Moderns of* Gassendus *and our* Hammond) *yet suffer your Grace for my greater Safety, to extend your help to me, and grant that I may profess in the Entrance to this Discourse, that I am*

Your Graces

Most humble and devoted Servant

Tho. Willis.

To the Most Learned and Worshipful

By me ever Respected

The Vice-Chancellor, Doctors, *and* Masters, *who diligently Profess, greatly Adorn, and happily Promote good Letters in the most Famous University of* Oxford, *Health.*

EXcuse me, Learned Men, if you, who were once my Auditors, I now desire to be my Readers, and you whom I ever found Propitious and Favourable, that I therefore wish you may be my Judges and Patrons. Your singular Humanity hath formerly enflamed my Industry, in this Physiological Undertaking, and given me Life and Strength; so that if that any thing of Praise be due to me, it ought to be imputed and referred to you. I know indeed how great difference there is, betwixt the flying words of Speakers, and those impress'd upon lasting Papers; but it seems of great Authority, that they have not been displeasing to your most Curious Judgments, in their utterance, and I hope they may now pass any Examen, having already passed your Critical Ears. It therefore belongs to you to defend, if not these my Endeavours, yet at least your own Judgments; and if perchance, the litterate *Thrasoe's* of this Age, who are wholly ignorant in Philosophy, every where wandring about, attempt to overthrow me with their Clamors, which is their chief Eloquence, to oppose your Authority against them, by which, if they are not put to Silence, it will be however an high Confidence and inviolable Security to

Honored Sirs,

the Admirer of you all,

THO. WILLIS.

THE

THE PREFACE TO THE READER.

Courteous Reader,

I *Have here given you what I had long promiſed, the* Pathology *of the Brain and Nervous Stock, and with it the previous Phyſical Meditations of the Soul of the Brutes, which is that inferior one of Man. This difficult task, when at firſt denied leiſure and retirement, it could not be performed; after the Death of my Dear Wife, being lonely, with frequent and unſeaſonable Studies, that I might the leſs think on my Grief, I have at laſt finiſhed this, according to my ſlender Capacity. But indeed in theſe Diſquiſitions (which the Anatomy of the Brain, and its Appendixes, hath lately and more exactly ſhown) as we have enter'd into a by-way, and not before trodden, there was a neceſſity to lead thee, thorow ſome ſharp and ſtony ways, beſet with buſhes and thorns, which might offend thee. And indeed I know not, whether it will be pleaſing to all, that inſtituting the ſomething Paradoxical Doctrine of the Animal Soul, that I ſhould aſſign to that Soul, by which the Brutes as well as Men live, feel, move, not only Extenſion, but Members, and as it were Organical Parts, yea peculiar Diſeaſes, and proper means or methods of Curing them; and that moreover, I ſhould form this, which is meerly Vital, and different from the Rational, and ſubordinate to it, and ſo Man, a Two-ſoul'd Animal, and as it were a manifold* Geryon.

That I may remove out of the way theſe little rubs, I do not at all doubt to overcome them, and evince the Corporeity of the Soul, by Reaſons not to be contemned, and alſo by the full ſuffrage, both of the Ancients and the Moderns; and beſides, that it is Bipart or Twofold, I have already, in another place, by a neceſſary Conſequence deduced, from the Life of the Blood, as it were a flame, and from the exiſtency of the Animal Spirits, and as it were lucid or ætherial Hypoſtaſis, aſſerted and proved. For granting to the Soul, one Vital Portion living in the Blood, to be a certain inkindling of it, and another Senſitive, to be only an heap of Animal Spirits every where diffuſed thorow the Brain and Nervous Stock; it follows from hence, that Brutes have a Soul Co-extended to the whole Body, and Parts not only many and diſtinct, but after a manner diſſimilar. But that ſome object, that the Soul of the Beaſt, becauſe it perceives, or knows that it feels, to be immaterial, for that Matter ſeems to be incapable of Perception, that indeed, had been likely, if that Perception ſhould paſs beyond the limits of Material things; or higher, than what inſpires them, which things are uſually attributed to Natural Inſtinct, or Idiocraſie or peculiar Temperaments, that I may omit Sympathies and Antipathies. But who ſhould be the Betrother? I profeſs the great God, as the only Work-man, ſo alſo as the firſt Mover, and auſpiciouſly preſent, every where, was he not able to impreſs ſtrength, Powers, and Faculties to Matter, fitted to the offices of a Senſitive Life? The Pen in the hand of the Writer, Diſputes, Intreats, gives Relations of things, and is in the mid ſt between things paſt and things to come; and why ſhould we not believe that greater things than any of theſe, may be done, when the Skill

of

of the Deity is preſent? Laſtly, If any one ſhall affirm, that moſt ſubtle Subſtance, and wholly Etherial, which ſerves for the Vital Oeconomy or Government to be immaterial, for that it enters upon the ſluggiſh Diſpoſition of inanimate Bodies, let him remember to be indulgent to me, if by chance I call it material, for that it ſubſiſts very much below the Prerogatives of Reaſon.

But I ſhall not ſtand upon theſe things, for truly I have prepared a far othergates defence; to wit, I ſpeak not from the Tripos *like an Oracle, nor from the Chair, but as one of a low form: I play not the Prophet, or Dictator, but the Philoſopher, neither do I plant an Opinion, but propoſe an Hypotheſis, and open my Judgment. Geometry has its Demonſtrations in it ſelf; we are Skill'd in that part of Philoſophy, where it abundantly ſuffices to have brought Logical Proofs: Surely he only certainly pronounces, who profeſſes his Errors, and whil'ſt he Philoſophizes about Man, remembers himſelf that he is a Man.*

But that according to the Adage, that I ſhould declare ſome to be rather ſick in Soul, yea firſt, and chiefly than in Body; otherways than the Schools of Phyſicians, which refer the Primary Seats of all Diſeaſes, into ſolid Parts, Humors, and Vital Spirits, or innate Heat: I ſay from our Hypotheſis, to wit, that this Soul hath a material Subſiſtence, extented equally with the Body, and peculiar Parts, Powers, and Affections; may be concluded, that it is found obnoxious alſo to preternatural Diſeaſes, and not ſeldom wants Medical help.

Moreover, That the Corporeal Soul doth extend its Sickneſſes, not only to the Body, but to the Mind or rational Soul, which is of an higher linage, and that it often-times involves it with its failings and faults, I think is clear enough in our Pathology or Method of Curing. Further, for the proving theſe two diſtinct Souls, to be together and ſubordinately in Man, as much as Authority and the force of Reaſons can, I think is there proved; which Opinion is ſo far from that I need to fear it ſhould be cenſured for Pernicious or Heretical; that on the contrary, we hope it is altogether Orthodox, and appears agreeable to a good Life, and Pious Inſtitution: from hence the Wars and Strivings between our two Appetites, or between the Fleſh and Spirit, both Morally and Theologically inculcated to us, are alſo Phyſically underſtood; for that, I ſee and approve the better things, and follow the worſer; *and this,* The Fleſh luſts againſt the Spirit, and the Spirit againſt the Fleſh. *So generally comes to paſs in us, for as much as the Corporeal Soul adhering to the Fleſh, inclines Man to Senſual Pleaſures, whil'ſt in the mean time, the Rational Soul, being help'd by Ethical Rules, or Divine favour, invites it to good Manners, and the works of Piety. Further, from hence, the chief Argument is brought againſt Epicuriſm, and Atheiſm, for that it is moved by the force of Reaſons, our Senſitive Soul even as that of the Brutes, miſcarrying, the other perpetually ſurvives; for truly being perſwaded of an after and Eternal State, why doth it not make it its whole buſineſs, that it may live more happily in it, or at leaſt not miſerably?*

But alſo, that it may be objected, that there cannot be therefore two Souls in Man, becauſe many forms cannot actuate at once the ſame Matter; It may be anſwer'd; that the Supream form of the ſame Subject, doth ſometimes ſubordinately include many others, but ſpecifies it only a Compound. Alſo, the Corporeal Soul being ſubordinate to the Rational, ſubſiſts immediately in the Humane Body, and this Superior is in the ſame, that mediating. It would be a much more difficult ſolution of this hard Buſineſs, if the Inferior Soul of Man, common to that with the Brutes, ſhould be alſo affirmed to be immaterial; for by what knitting together, can two independent Souls ſubſiſt in the ſame Body; being from thence ſeparated and Combined, by no common Bone, into what place can they depart ſeverally? Certainly as to reaſon, it is more probable, and to the Humane government more agreeable, to affirm that one moſt ſubtilly Corporal Soul, is joyned immediately to the Body, and is intimately united, and that by the intervention of this Soul, another immaterial, reſiding in its Boſom, inhabits the Body, and is the ſupream and principal form of the whole Man: But that after Death, the Corporeal Soul being extinct, this ſurvives and is Immortal.

That the Corporeal, Flameous, and lucid Nature of this Soul, and its Parts and Affections, may be the better known, I have thought it neceſſary to deſcribe the Vital Organs, both of all Kinds of living Creatures, by the Action of which the Lamp of Light is maintain'd; and alſo to ſhew plainly laid open, even to their intimate receſſes, and leaſt and ſecret Paſſages, the Brains, both of the more perfect Brutes, and alſo of Man. The Anatomy of which being manifold; not being able to perform it only with my own hand, and Skill, being alſo almoſt continually interrupted by my Practice, the Famous and Skilful Anatomiſt and Phyſician Dr. Edmond King *was much helpful to me, by his aſſiduous and notable aſſiſtance and labour. Alſo that learned Man, and my moſt intimate Friend, Dr.* John Maſters, *Skilful in Phyſick and Anatomy, imployed much of his Labour and Diligence in the ſame Buſineſs. Out of this various* Zootomie *or Anatomy of the more perfect Beaſts and many-flower'd diſſection, the wonderful things of God are very much made known, for as much as in every the ſmalleſt and vileſt little Animals, not only the Face and Members, but alſo the inward Parts, as it were the Hearths and Altars for the continuing the Vital Fire, ſhew them to be of a moſt Elegant and Artificial and plainly Divine Structure.*

As to our Pathology *or Method of Cure, I muſt confeſs, that in delivering the Theory of Diſeaſes, leaving the old way, I have almoſt every where brought forth new Hypotheſes: but what being founded upon Anatomical Obſervations, and firmly ſtabliſhed, better ſolve all the Phænomena of the Sick,* (viz.) *They declare more aptly the Cauſes of the Symptoms, and ſhew the Reaſons of Curing, more accommodate to every Diſeaſe. But as to the Remedies and Therapeutic Method, althô we follow not exactly, after the manner of others, the Ancients, we have nevertheleſs rejected nothing ratified by grave Authority, or approved by daily Experience; and beſides, we have added many things found out Emperically and Analogically by the Moderns; Althô it is neither our Hope or Ambition that theſe ſhould be pleaſing to all; yet (what is my laſt wiſh) I doubt not, but that this may be an help to many for the illuſtrating the Medical Science, and for the more happy Curing of Cephalick Diſeaſes.* Farewel.

OF

OF

The Soul of the Brutes,

The First Part

PHYSIOLOGICAL,

SHEWING,

Its NATURE, PARTS, POWERS, and AFFECTIONS.

CHAP. I.

The Opinions of Authors both Ancient and Modern are recounted.

The Contemplation of the Soul pleasant but difficult.

WIth what Pleasures, and with what Delight, beyond other things, the Contemplation of the Soul hath drawn to it self the Wits of Men, and most profoundly Exercised them, appears even from hence, that almost none of the Philosophers, of whatsoever Sect they were, and of every Age, who have not laboured in the search of it: But indeed, how hard and abstruse it is, and with what dark Blackness, not less than the shades of Hell it self, this Knowledge of the Soul is over-shadowed, may be gathered from this; because they are opposite and uncertain, concerning it; yea, almost as many Men as there are, so many several Opinions have they Published; that truly 'tis no unjust Complaint of the Soul, that she understands all things but her Self. Nevertheless, in this Age, most fruitful of Inventions, when that so many Admirable things not before thought on, as it were another Ancient World unknown, are discovered, about the building of the Animal Body, when new Creeks are daily found out, new humours spring up, and altogether another Doctrine than what hath been delivered by the Ancients, concerning the use of many of the Parts, hath been instituted; why may we not also hope, that there may be yet shewn a new disquisition concerning the Soul, and with better luck than hitherto? Therefore, however the thing may be performed, I shall attempt to Philosophise concerning that Soul at least, which is Common to Brute Animals with Man, and which seems to depend altogether on the Body, to be born and dye with it, to actuate all its Parts, to be extended thorow them, and to be plainly Corporeal; and that chiefly, because, by the Nature, Subsistence, Parts, and Affections of this Corporeal Soul rightly unfolded, the Ingenuity, Temperament, and Manners of every Man may be thence the better known; as also the Causes, and formal Reasons of many Diseases, as of the Phrensie, Lethargy, Vertigo, Madness, Melancholy, and others, belonging rather to the Soul than to the Body, as yet hidden, may in some part be discovered: Then Secondly, because the ends and bounds of the aforesaid Corporeal Soul being defined, the Rational Soul, Superior and Immaterial, may be sufficiently differenced from it; nor is that Argument admitted so easily, confounding them together, whereby some deserving very ill of themselves, have affirmed the Souls of Man and the Beasts only to differ in degrees of Perfection; and so that either alike must be either Mortal or Immortal, and alike propagated *ex traduce* or from the Parent. Wherefore that the Dignity, Order, and Immortality of the Rational Soul, discriminated from the Corporeal, may be vindicated, and likewise that we may make a way to the remaining Pathology, or Method of Curing of the Brain and Nervous Stock, in which not only Parts of the Body, but often the animal Spirits, yea, sometimes the whole sensitive Soul, seems to be affected, (altho we have formerly unfolded according to our slender Ability, not after this manner, the Descriptions and Uses of the Brain and Nerves,) Therefore at present, we

It Conduces to the knowing of the Manners of Men, and the Diseases of the Soul.

It distinguishes the Rational Soul of Man, from that other of the Brute.

ſhall endeavour to deliver a certain Doctrine of the Soul, previous to the ſhewing the Doctrine of the Diſeaſes of thoſe Parts. But here it will be firſt expedient to rehearſe the Opinions of others, or at leaſt the chiefeſt and moſt noted among them: From which, being put together, if not what the Soul truly is, may be made known; yet what many conſidering it have thought of it; and from thence a little more certain ſearch of it, we may enterprize.

And indeed if we would grow wiſe concerning the Soul only out of the Pleas of Authors, and the Writings of Philoſophers of every Age, we ſhould be intangled in a Labyrinth of Opinions, following for truth mere Phantaſms, and for the genuine Idea of the Soul, as it were the Apparitions of divers Specters. But that we may reduce the various Opinions, whatever have been declared, both of the Anciens and Moderns, to ſome certain Heads; it will be fit that we obſerve, ſome did affirm it to be Corporeal, others Incorporeal. In either Kind we meet with great diverſity of Opinions. For firſt of all, among thoſe who thought it Incorporeal, ſome affirmed it to be a Subſtance exiſting of it ſelf and immortal, others without Subſtance having only an accidental form. Thoſe who believed the Soul an Incorporeal and Immortal Subſtance, differed alſo among themſelves. The *Platoniſts* and *Pythagoreans* ſaid, the Souls of all living Creatures, to be a certain Part of the Univerſal Soul of the World, and that they were depreſſed or immerged in this lower Body, as in a Sepulcher; and therefore, the Soul, when the Animal received Life, was not born but dyed; for as much as by this inferior Birth, it was divided from the ſimple and undivided fountain of Nature. Further they thought, that the ſame Soul ſo demerſed, did wander from one Body being dead, to another, and ſo by a various *Metampſeuchoſis*, did inhabit or was a gueſt ſometimes in the Bodies of Men, and ſometimes of Beaſts. The *Manichees* aſſerted, That all Souls being taken out of the Subſtance it ſelf of God, did actuate Terreſtrial Bodies, and going from hence again, returned into God himſelf. The *Origeniſts* different from either, taught that Souls were Created from the beginning of the World, and at firſt to ſubſiſt of themſelves, then as occaſion ſerv'd, that Bodies being formed, they enter'd into them being begun, and actuated them during Life, and that at length they returned to their private or ſingular Subſtances. The ſtate of which Souls, tho ſome attributed it only to Humane Souls; yet there were others, who granted the like Immortality to the Souls of the Brutes, yea and of Plants.

Some have affirmed the Soul of the Beaſt to be an Incorporeal Subſtance; to wit, the Platoniſts, and the Pythagoreans.

On the contrary, *Nemeſius* (but untruly) ſaith, That *Ariſtotle* affirmed the Soul to be Incorporeal, but without Perfection and Mortal, when he had deſigned the *Entelechia* or Perfection of every living thing; as to wit, She as it were ariſing up of her own accord, from Power only of matter rightly diſpoſed, underſtands nothing elſe, but its own Craſis or Temperament, reſulting from the mixture; which as it adds nothing ſubſtantial to the præexiſting Matter, the Soul it ſelf ſeems to be from thence a mere *Ens* of Reaſon, and only an extrinſical denomination. Further, when the *Peripateticks*, from the Soul raiſed up out of the Grave of Matter (which they affirmed to be a ſimple form, without Extenſion and diviſibility) do contend that the Members of the ſame Body, do perceive many things at once and together, they have introduced into the Schools that Plea or rather Riddle, to wit, *That it is whole in the whole, and whole in every part.* To this Opinion thus unfolded, that of *Dicæarchus* was a-Kin, who ſaid the Soul was *Harmony*, and alſo that of *Galen*, who call'd it a *Temperament*.

Cap. 2. de Nat. Hom.

Others an Incorporeal form as the Peripateticks.

Nor do we meet with a leſs diverſity of Opinions, among the Philoſophers of every Age, delivering that all Souls, or all others, the rational excepted, are Corporeal. To paſs by thoſe who have affirmed the Soul to be either Fire, or Air, or Water, or ſomething made out of many of theſe Elements; ſome, as *Critias* and *Empedocles* have ſaid, that it was *Blood*. Which Opinion the Sacred Scriptures in ſome places plainly favour, where the eating of Blood is forbidden, becauſe it is the *Life* or the *Soul*: Moreover, there are not Reaſons and Arguments wanting, which conclude this to be very near, or very like to Truth; as ſhall be ſhewn anon.

Others affirm the Soul to be Corporeal, and either ſomething out of the Elements or the Blood, &c.

To theſe may be added, the Opinion of *Epicurus* delivered of old, and of late revived in our Age, which introduces the Soul plainly Corporeal, and made out of a knitting together of ſubtil Atoms, and aſſerts, citing *Laertius*, ὅ τι ἡ ψυχὴ, &c. which according to the mind of *Gaſſendus*, is as much as to ſay, *That the Animal is as it were the Loom, in which the Yarn is the Body, and the Woof the Soul.* From thence *Laertius* deſcribing more fully its Corporeity, ſaith, ἐξ ἀτόμων, &c. *which is, that the Soul is Compoſed of moſt light Atoms, and round, not much different from thoſe out of which fire is.* Other *Epicureans* deſcribing the Nature of the Soul, otherways, depaint it as from ſomething hot, flatuous, and airy, we need not to unfold any further this Opinion, nor ſhew out of *Laertius* and *Lucretius*, by what Rite the Aſſertors of the *Epicurean* Philoſophy, do accommodate ſuch an Atomical Compoſition of the Soul, to all the Actions and Affections of the Function, or Animal Government, which are to be performed.

The Opinion of Epicurus, that the Soul is made out of Atoms.

Upon

Upon this Hypotheſis of the *Epicureans*, as it were its baſis, the Philoſophers of this latter Age have built all their doctrines of the Soul, tho very divers, and I may almoſt ſay oppoſite. For as the ſoul of the Brutes, is affirmed by moſt of them, to be Corporeal and diviſible, yet ſhe is by ſome of them deprived of all Knowledg, Senſe, and Appetite; in the mean time, not only Senſe, Memory, and Phantaſie is granted to her by others, but the uſe of a certain inferior Reaſon. And what is more to be wonder'd at, the ſame end of their Aſſertion is propoſed by either Sect; to wit, That the Soul of the Brutes, both as it may be deprived of its gifts, and alſo as it is moſt notably adorned by them, may be very much diſtinguiſh'd, *or* (that I may uſe the Idiom of the Schools) diverſified from the humane Soul.

The late followers of the Philoſopher Epicurus *have affirmed the Soul to be made of Atoms.*

The firſt Aſſertor of the former Opinion was *Gometius Pereira*, who affirmed that Beaſts wanted all Knowledg or Perception; whom in our latter Age, the Famous Men *Carteſius* and *Digby*, with others Exactly followed; who endeavouring as much as they could, to diſcriminate the Souls of Beaſts from the humane, affirmed them, to be not only Corporeal and Diviſible, but alſo meerly paſſive; that is, that they were not all moved, unleſs that they were moved by other Bodies, ſtriking ſome part of the Soul; from whence it followed, that every action of the Brute Conſiſted in it, as it were an artificial Motion of a Mechanical Engine, to wit, that firſt ſome ſenſible thing affecting the animal ſpirits, and Converting them inwards, ſtirs up ſenſe; from which by and by, the ſame ſpirits being moved, as it were by a reflected undulation or wavering, return back again, and being determinated for the fitted order of the organs and parts of the Fabrick it ſelf, in certain Nerves and Muſcles, they perform the reſpective motions of the Members: For otherwiſe, if Cognition be granted to the Brutes, you muſt yield to them alſo Conſcience, yea and deliberation and Election, and a Knowledge of univerſal things, and laſtly an incorporeal and rational ſoul.

Others of them deny it to have Senſe and Perception, as Gometius Pereira.

Whilſt theſe famous Philoſophers ſuppoſe Brute Animals to be only certain Machines wonderful made by a Divine Workmanſhip; to wit, which without any Knowledg, Senſe, or Appetite, perform only Corporeal Motions, and the Acts of their Faculties, according to the fitted ſtructure of parts, and the preciſe direction of the ſpirits, within Certain meaſures or bounds of the Animals; yet ſome of them differ in their Opinions, about the ſtructure and model of the Machine or moving Engine; to wit, for as much as the figure and properties of the Atoms, out of which the ſame is ſuppoſed to be made, are aſſigned one way by theſe, and after a divers way by thoſe. The moſt illuſtrious *Carteſius*, unfolding all things by matter and motion, aſſerting the Souls of Brutes to conſiſt altogether of round and highly moveable Atoms, which he Calls the Elements of the firſt Kind; affirms, That nothing elſe is requiſite for all its acts to be performed, than that the fibres and nervous parts being ſtruck by a ſtroke of a ſenſible thing, they receive a motion after this or that kind of manner, and transfer it by a Continued affection of the ſenſitive parts, as it were by a Certain undulation or wavering, into the reſpective parts: But our *Digby* ſuppoſing mobility of the particulars of this kind, out of which the Soul is made, adds further, That certain moſt thin Effluvia's, falling away from the ſenſible Body, do not only affect the Exterior ſenſories, but entring into the more interior receſſes, mix themſelves with the ſpirits, and moving them into Various fluctuations, do produce ſenſe, and divers ſorts of local motions: Moreover, that out of theſe Extrinſical Atoms, ſo entring into the nervous parts, and the Brain it ſelf, do proceed not only Extempory Actions; but out of thoſe left in the feeling body, and retaining the former Configurations, are Conſtituted the remaining Idea's, in the memory of things formerly done. It would be too prolix a buſineſs to recount particularly what appertains to the aforeſaid Hypotheſis, concerning the ſouls of Brutes, or animal Actions; or to Examine the Reaſons of each; alſo to ſhew by what manner of Solutions of that Kind, thoſe operations of the Brutes, which ſeem to be made by a Certain Judgment and Ratiocination, are wont to be unfoulded.

Carteſius.

Digby and Others.

But indeed theſe Solutions of difficult *Phænomena's*, and the Reaſons for the mechanical proviſion of living Creatures, and their Souls, tho artificially formed by theſe Authors, ſeem not to ſatisfie a Mind deſirous of Truth: And whilſt every one expounds ſo the Works of the Creation, according to the model of his Wit, they ſeem to ſay, That God is not able to make any thing beyond what Man is able to Conceive or Imagine. Wherefore others, alſo renowned Philoſophers, both Ancient and Modern, profeſſing themſelves no leſs adverſe to Atheiſm than the former, Challenge in the behalf of the Beaſts, not only the operations of an external and internal Senſe, with Perception, Appetite, and ſpontaneous motions; but beſides, grant to them a certain uſe of Judgment, Deliberation, and Ratiocination.

Others attribute to the Corporeal Souls ſence and Perception; and further, the uſe of an inferior Reaſon; as

Nemeſius an ancient Philoſopher, diſcourſing of the Cognation or Propinquity of all Created things, after he had ſhewed from Minerals, that ſome things came near towards

Nemeſius.

De Nat. Hom. Cap. 1. the natures of Vegitables, and ſome of Plants, and Animals, ὁ δημιυργὸς (ſaith he) μετακλινων, &c. which is, The Common Architect paſſing from irrational Creatures to that rational Animal Man, hath not effected this ſuddenly, but firſt has referred certain natural Knowledges, and Artifices, and Subtilties to other Animals, ſo that they appear near to rational Creatures.

Phyſ. Sect. 3. Membr. poſt Lib. 8. Cap. 4. *Peter Gaſſendus*, a moſt Skilful and Cauſe-Expreſſing Man, in his late Experimental Philoſophy, when he had enumerated very many Inſtances, by which the Cunning and Wonderful Sagacity of brute Animals were declared; and alſo the Epithets, whereby theſe kind of Animals are noted by Philoſophers, to wit, that ſome are called *Excelling in Knowledg*; others *Artificial*, theſe Dexterous and Compleat, or Crafty and Wiſe, at length the Author adds, that, *Theſe things could not deſervedly be attributed to them, unleſs they granted them a certain kind of Reaſon. However it be, we may ſeem at leaſt to be able to diſtinguiſh, by a ready way, that as Commonly a two-fold Memory, To wit, a Senſitive and Intellective, is diſtinguiſhed, ſo nothing forbids to Call Reaſon Senſitive and Intellectual. And truly, as we underſtand by the Name of* Reaſon, *the faculty or beginning of Ratiocination, and that to Reaſon is nothing elſe, than to underſtand one thing by the Knowledg of another thing, there is nothing more Eaſily to be obſerved, than that Brutes do Collect one thing out of another, or what is the ſame thing, do reckon or recount, and therefore are indued with Reaſon.* From theſe we may eaſily underſtand, what dignity, and beyond the powers of any Machine, cauſing its Efficacy, he affirms to be in the Souls of Beaſts. But in the mean time, if it be marqu'd, what Hypoſtaſis, or formal Idea, he hath aſſigned them; it doth not ſo Eaſily appear, how that ſuch Choyce Priviledges, do agree with thoſe Souls, ſo ſlenderly gifted, as to their Subſtances. For when from the Opinion of *Epicurus* he had ſhewn theſe to be Corporeal, and their Bodies to be made up of moſt light and round Atoms, out of which ſort fire and heat is Created; at length he Concludes; *The Soul therefore to be a Certain Flame, or a Species of moſt thin fire, which as long as it lives, or remains inkindled, ſo long the Animal lives; when it no longer lives or is Extinguiſhed, the Animal dyes.* But indeed, concerning his Hypotheſis, he ought to have unfolded, by what means this Fire *Intelligent* and *Artificial* (to ſpeak like the *Stoicks*) could be; or how a flame within certain bounds and Organs of the Body, however framed with the moſt excellent artificie, being inkindled and dilated, can be able to produce the Acts of the animal Faculty; This I ſay, moſt difficult Problem, this moſt Learned Man came to, and paſs'd over its Knot as it were purpoſely in that place.

Who aſſerts the Soul, to be a little flame, or a Certain fire.

CHAP. II.

The Opinion of the Author Concerning the Soul in General,

That the Soul of the Brute is Corporeal and Fiery.

After having thus recited the chief Opinions of others, It now remains that we propoſe our own Opinion, or rather Conjecture, in ſo hard a matter. Where in the firſt place, I am not eaſily led to believe, That the Soul of the Beaſt is an Incorporeal Subſtance, or Form: For as to what relates to that *Platonick* Fiction, concerning the Soul of the World, that, and alſo the Hereſie of the *Manichees*, hath already been refuted and clearly exploded, both by the Ancient and Modern both Philoſophers and Theologiſts, that there remains no further diſpute about it. Further, neither can I Conſent to thoſe *Origeniſts*, who have affirmed the Souls of all Living Creatures to be immaterial, and alſo to ſubſiſt before and after their Bodies. For, tho I ſhould be little ſolicitous, for the almoſt infinite multitude of the more perfect Beaſts, which have liv'd, and do live, yet where do ſo many Myriads of Souls, even innumerable, of Inſects and Fiſhes, which are dayly produced, ſubſiſt, and what do they? The Bodies of very many of theſe ſerve only for Food to other Creatures. And for, that the Souls to theſe Bodies, ſerve chiefly to preſerve them only for a little time, and as it were pickle them to keep them from putrefaction, there is no need that theſe ſhould be therefore immaterial and immortal. Beſides, when of old, *Egypt* was infeſted by Divine Puniſhment, with Swarms of Fleas, Flyes, and other Various Kinds of innumerable Inſects, and that the ſame alſo abounded every where, it is not eaſily to be Conceived, from whence ſo many Souls were ſo ſuddenly Called, and into what places, the ſame being by and by ſeparated, could be placed. Moreover, as Heaven, the Kingly Palace of the Great God, challenges for it ſelf Angels, *Gen.* 2. and pure Souls, free from all ſpot, to be its Inhabitants:

Why the Soul of the Beaſt ſeems not to be an incorporeal, and immortal ſubſtance.

but

but the Earth, as it were a Certain ſink, draws forth and extracts the feces of things, and from its bulk, ruinous Bodies; it ſeems more agreeable to the fitted Oeconomie of the World, that all immaterial things (with the humane Soul, which we have noted to be placed in the Confines of Nature, that it might be the faſtning and knitting of either Syſtem) ſhould be aſcribed to the Air; but the other Animals, Condemned to the belly, and prone to the Earth, to this Glebe; ſo that the Souls of thoſe, may be ſaid to be born and dye with their Bodies, and to be altogether Corporeal. Yea if that Reaſons and Arguments of greater weight, fight for this Opinion, than thoſe we have ſeen on the oppoſite ſide; wherefore ſhould we not rather follow this, and paſs farther on into its parts?

It is ſhown that it is Material and Co-extended with the Body.

And indeed, that the Soul of the Brute, even as the inferior of Man, Is material and diviſible, yea Co-extended with the whole Body, ſeems to appear from many things; both firſt, becauſe we perceive many and divers animal Acts, to ariſe at once, from divers members and parts of the Body: For Examples ſake; in the ſame inſtant, that the Eye ſees, the Ear hears, the Noſe ſmells, the Tongue taſts, and all the Exterior members Exerciſe the ſenſe of feeling and motion, and in the mean time, all the Inwards and the *Præcordia* perform their offices. Wherefore, ſince there is no medium between the Body and the Soul, but that the members and parts of the Body, are the Organs of the Soul; what can we think elſe, or affirm, but that many and diſtinct portions of the ſame Extended Soul, actuate the ſeveral members, and parts of this Body? Beſides, it is ſeen in ſeveral living Creatures, whoſe Liquors, both the Vital and Animal (in which the Soul as to all its parts immediately ſubſiſts) are viſcous, and leſs diſſipable, that the Soul is alſo divided with the Body, and exerciſes its Faculties, to wit, of Motion and Senſe, in every one of the divided members, layd apart by themſelves. So Worms, Eeles, and Vipers, being cut into pieces, move themſelves for a time, and being pricked will wrinkle up themſelves together.

The Suffrages and Reaſons of very many Authors, perſwade that the Soul of the Brute, is not only Corporeal, but Fiery.

But that we have affirmed the Soul of the Brute to be not only Corporeal, and Extended, but that it is of a certain fiery nature, and its Act or Subſtance is either a Flame or a Breath, neer to, or a-Kin to Flame, beſides the large Teſtimonies of Authors, both Ancient and Modern, Reaſons and Arguments almoſt demonſtrative, have alſo induced me to it. Some of the Chief of theſe, we have of late Expoſed in the Treatiſe concerning the Inkindling of the Blood; there remains many others of no light moment to be added hereafter. As to what appertains to the ſuffrages of others, that I may not ſeem to ſtand upon the Authority of one *Gaſſendus*, who has maintained this Hypotheſis; I ſhall here Cite many both Ancient Phyſicians and Philoſophers. For not to mention *Democritus*, *Epicurus*, *Laertius*, *Lucretius*, and their followers; *Hippocrates*, *Plato*, *Pythagoras*, *Ariſtotle*, *Galen*, with many others, tho diſagreeing about other things, in this Opinion, to wit, That the Soul was either a Fire, or ſomething analogical to it, they all ſhook hands; to whom alſo have joyned themſelves of the Moderns, *Fernelius*, *Heurnius*, *Carteſius*, *Hogelandus*, and others: and lately *Honoratus Faber*, hath delivered in Expreſs words, *That the Soul of the Brute is Corporeal, and its Subſtance Fire it ſelf*: But indeed he far otherwayes Explicates his ſaying, than is propounded in our Hypotheſis. For having ſhewn this Soul to be material, and ſuppoſed all ſublunary matter to be nothing elſe but the four Elements, he therefore Concludes the Soul of the Brute, becauſe it is not ſeen to be any thing Compounded out of the reſt of the ſimple Elements, or of many of them, *That it is mere Fire*, *Tract.* 2. *l.* 2. *pr.* 33. *ad* 38. I ſhall take notice of one or two of our Countrymen. The moſt noble *Verulam*, chiefly diſtinguiſhes animals from inanimals, in this reſpect, for that the ſpirits of thoſe are otherways inflamed and inkindled, than the ſpirits of theſe. *Natur. Hiſtor. Cent.* 7. The moſt Learned and Famous Phyſician *George Ent*, in his Apology againſt *Pariſanus*, That Blood even as Fire, deſires two things, to wit, Food and Ventilation, hath moſt clearly demonſtrated. Wherefore, after ſo many Learned Men, it will be no Paradox to affirm, *That the Soul lying hid in the Blood, or Vital Liquor, is a certain fire or flame*; which Opinion agrees well enough with right Reaſon, as appears by what follows.

The more Ancient Philoſophers and Phyſicians have ſo affirmed.

Alſo many Moderns of great Note.

Hon. Faber. Tract. de Plantis et gener. anim. &c.

Arguments and Reaſons perſwade the ſame thing.

Indeed if Fire and Flame are to be defined or unfoulded, not by thoſe External accidents of burning, glowing, and of heat, (which are not its proper Paſſions) but by intrinſic Cauſes; we conceive very eaſily, the ſubſtances of them to be even as the Souls of the Brutes, or altogether of the ſame ſort. For truly, Fire, if we would deſcribe it according to its Eſſence, it ſignifies an heap of moſt ſubtil Contiguous particles, and exiſting in a ſwift motion, and with a continued generation of ſome, renewed by the falling off of others; which indeed Conſerves both its motion and ſubſtance; for that its Food, on which it continually feeds, is perpetually ſupply'd from the ſubject matter, which is Sulphur or ſome other nitrous thing in the Air, that Compaſſes it about; for from thence, out of the Food of either, the Particles being moſt minutely reſolved, and agi-

The diffinition of Fire and Flame by its Cauſes and Eſſences, agrees alſo with the Soul of the Brute.

tated

tated with a moſt rapid motion, the forms of Fire and Flame (which differ only in more or leſs) reſult. Since we have in another place diſcourſed largely enough of theſe things, it will not be needful to add any more here.

The Souls of all Brutes after the manner of Fire, want a two-fold Food, to wit, a Sulphureous and Nitrous.

What if we ſhould in like manner ſay, That the Souls of Brutes, are an heap of theſe ſorts of moſt ſubtle Atoms, heaped up together, and extreamly moveable? To wit, which being ſtirred up with Life into motion, as it were an inſiring, Continue the ſame, and likewiſe its ſubſiſtance, ſo long as Nutriment, out of the appoſite matter, which is by degrees Conſumed, within Sulphureous, and without Nitrous, from the ambient medium, is granted to it. For that we ſay, That the Souls of all Brutes, ſo long as they live, and flouriſh after the manner of fire, do want Conſtantly either kind of aliment; to wit, Sulphureous and Nitrous: That this is true, is ſhewed hereafter, as well concerning Inſects and other bloodleſs Creatures; alſo concerning Fiſhes, and the more frigid bloody Creatures, as well as in the more hot and perfect Creatures, that have blood: Which Conditions however, are required to the Act and Subſiſtance of no ſubject beſides. But no motion, either of Fermentation, Ebullition, Vegitation, or of any other thing, (beſides Life and Fire) is immediately ſuppreſt, by reaſon of the taking away of the Air.

There are three things to be Conſider'd of Concerning the Soul of the Brute.

Concerning the Corporeal Soul in general, theſe Three things firſt fall under our Conſideration: *viz.* Firſt, What kind of Subſiſtence or Hypoſtaſis it is of. Secondly, In what its Life or Act conſiſts: And Thirdly, What are its primary Offices or Operations.

Its Subſiſtance or Hypoſtaſis.

As to the firſt, we may believe, That the Brutal Soul doth conſiſt of Particles of the ſame matter, out of which the organical Body is formed, but that they are choyce, moſt ſubtle, and highly active, which, as a flower ariſing out of the groſſer maſs, do mutually come together, and do conſtitute fit paſſages, which they produce thorow the whole frame of the Body, having got one continued Hypoſtaſis, to wit, very thin, and as it were Spirituous, and equal, and extended to the whole. For indeed, ſo ſoon as any matter is diſpoſed towards Animation, by the Law of Creation (and not by a Fortuitous Concourſe of Atoms) at once, the Soul, which is the form of the thing, and the Body, which which is called Matter, begin to be formed under a certain Species or Kind, according to the Model or Form impreſſed upon them. Wherefore, the more nimble and Spirituous Particles, rowling away from the reſt, heap themſelves together, and by leaſure grow Turgid. Theſe being thus moved, ſtir up others more thick, and diſpoſe them into deſtinated places, where they ought to ſtay and to increaſe, and ſo they frame the Body, according to its deſtinated Species. In the mean time, this heap of ſubtle Particles, or the Soul, which explicating it ſelf more largely, and inſinuating its Particles into other more thick, and weaving them together, frames the Body, and is exactly formed according to the dimenſion and figure of that Body, is Co-extended with it, and fitted exactly, as to a little Box or Sheath, actuates, inlivens, and inſpires the whole, and all its parts: Further, on the other ſide, the ſame Soul, being apt preſently to be diſſolved from it ſelf, and to vaniſh away into Air, is Conſerved by the Containing Body in its Subſiſtance and Act.

So indeed, the Soul, altho moſt thin, yet Corporeal, ſeems to be as it were the Specter, or the ſhadowy hag of the Body: Further, this ariſing together with the Body, out of matter rightly diſpoſed, receives its Hypoſtaſis or Subſiſtence, no leſs than the Body, according to the Idea or Pattern fore-ordained to it, by the Law of Nature; But altho intimately united to the Body, and is as its prop or ſtay, Yet being made of a moſt ſubtil texture, and as it were of a moſt ſlender thrid, it cannot be perceived by our Senſes, but is only known by its Effects, and Operations. Moreover, when as by reaſon of hurt hapning to it, or to the Body, that the Life of the Soul periſhes or is deſtroy'd, preſently its Particles being ſnatched away from the Concretion, or its mutual adheſion, they are altogether diſſipated, without any footſteps or marks left: In the mean time, the Body being made exanimat or Soul-leſs, by and by tends to Corruption, but indeed, if it be more groſs and more Compact, its Principles waiſting or unrolling themſelves leiſurely and by degrees, it is not Corrupted but of a long time.

In its Life or Act.

2. The Exiſtency of the Corporeal Soul, depends altogether on its Act or Life; and in this reſpect it ſeems moſt like to Common Flame, and only like it; to wit, for as much as the ſubſtance of either, as ſoon as it Ceaſeth from all motion, it is no more, and can by no means be made whole again in the ſame number. Wherefore, the Eſſence of this begins altogether from Life, as it were the inſiring of a Certain ſubtil matter; to wit, when many active, and chiefly ſpirituous, and ſulphureous Particles, with ſome other ſaline, being prædiſpoſed to Animality or Life, come together, in a fit Furnace or fire-place, take Life, ſometimes being as it were inkindled by another Soul, ſometimes of their own accord, which, from thence being ſupplyed, conſtantly (as we have ſaid) by a ſulphu-

ſulphureous ſood within, and a nitrous without, Endures for ſome time; until at length, by the defect of Either of theſe, or by reaſon of ſome Violence or Injury hapning outwardly, the ſame as it were being Extinct, periſheth quite. The Act of the Corporeal Soul, or the inkindling of the Vital matter, in the more perfect Brutes, being indued with an hot Blood, appears ſo clearly and openly by noted heat, by the Exhalation of its fumes or ſut, with other Accidents and Effects proper to the Kitching flame, that any one Conſidering or weighing them, may well believe that the blood doth truly flame forth, and that Life is not ſo like to flame, but even a flame it ſelf, as we have formerly ſhew'd at large: But indeed in others leſs perfect or frigid Animals, altho we do not ſay the Soul is properly flame; yet (which is next to it) we ſay it is a moſt thin heap of ſubtil Particles, and as it were fiery, to wit, a certain ſpirituous breath; this being ſhut up in the Body, agitates its thick bulk, actuates all its members, and arteries, and in ſome with wonderful agility, goes thorow and inſpires the ſame, more than in the more perfect animates, as appears in ſome Reptils and Inſects. Further, that there is a firey Vigor in theſe Kind of Souls, may be even Collected from hence, becauſe, whilſt they live and do not lye aſleep, they have no leſs need of Food and acceſs of Air, than the more hot living Creatures; as ſhall be declared anon.

In its Offices and Operations.

3. As to the Operations in General of the Corporeal Soul, we ſay, That as ſoon as it Exiſts in Act, that it performs chiefly theſe two offices; *viz.* Firſt, to frame the Body as it were its domicil or little houſe, and then that Body being wholly made, to render it apt and fitted to all the Uſes neceſſary both to the Kind, and to the Individuum: for which Uſes it is furniſhed with a manifold Guard or Company of Faculties or Powers; alſo according to the Various inſtincts and ſuggeſtions of Nature, it exerts or puts forth as it were predeſtinatedly the Acts of a Various Kind, altho almoſt after the ſame manner. It will not be an eaſy matter here to rehearſe, all the natural Powers and Habits with which all Corporeal Souls are wont to be gifted, to wit, becauſe they are not in all after the ſame manner; But as living Creatures are more or leſs perfect, ſome than others, alſo according as they being deſtinated for the Various Scene of this worldly Theatre are diverſly figured, and ought to live, their Souls alſo are furniſhed by a divers manner of proviſion of Faculties: The ſpeculation of theſe things, tho very pleaſant and profitable, is too copious and large for us to divert our ſelves within this place; But for the illuſtrating of our Pſychologie or Doctrine of the Soul, it may not be amiſs to recite the chief Kinds of Living Creatures, and to reduce them as it were into certain Claſſes or Forms, and then to deſcribe their Chief Species, together with the Various degrees of the Souls, that inhabit them.

CHAP. III.

The Various Kinds of Brutes, together with their reſpective Souls, and the chief Species of each of them, are rehearſed and deſcribed.

FOr as much as the Brutal Soul ought to be proportionate to the Organical Body, it eaſily follows, that as there are Various kinds of Bodies, in the divers Habitacles of this world, and offices of thoſe Bodies deſtinated to life, ſo alſo Various Souls, by which they are actuated, do exiſt, and are indued with a Divers Gift of Faculties. If we would conſider the perfect Sence of theſe, it were firſt needful to write the Hiſtory of all Animals, and to deliver the Anatomy of each of them. But as that will be a buſineſs of an immenſe and tedious labour, it ſeems much more to the purpoſe, to reduce here, all the Bruits to certain Kinds, according to ſome certain affections in many of them, and thence to deſcribe ſome chief Species of thoſe Kinds, and their Various Compoſitions and Structures, in reſpect of the Vital parts.

Animals are reduced into Claſſes either according to the Organs of Reſpiration, Or according to the Vital Humour; and they are either without Blood, or of frigid Blood, or hot Blood.

Living Creatures may be diſtinguiſhed or reduced into certain Claſſes, either Firſt, according to their Various Organs of Reſpiration, which in ſome are numerous Branchiæ or Gills, and theſe diſperſed thorow the whole Body, as in many Inſects, or they are appropriated Branchiæ or Gills, in Fiſhes; or laſtly, Lungs, common beſides to divers animals, with Man. Or ſecondly, the rehearſal of the Brutes may be made according to the Various Conſtitution of the vital Humour, in which reſpect, they are either Firſt, without Blood, or Secondly, of a leſs perfect or frigid Blood, or Thirdly, of a more perfect or hot Blood: And to this partition, as the more Known, inſiſting here, we ſhall run thorow the ſeveral members of it in Order, and briefly Notifie in them the Fabricks of the

the chief Vital parts of the Body, and the Conſtitutions of the Souls, Inhabiting them.

Bloodleſs Creatures are either of the Earth or Water.

Firſt, Bloodleſs Creatures, are either belonging to the Earth, in which number are very many Inſects; or belonging to the water, of which Kind, beſides ſome certain Kinds of Inſects, are alſo found various Fiſhes, which are wont to be divided into Soft, of which ſort are the Cuttle Fiſh, the Sea Woolf, *&c.* Shelly, as Oyſters and Cockles, *&c.* And Pargated or other thinner ſhell'd Creatures, as the Lobſter and Crab: We will examine in either ſort, ſome chief Species of theſe Bloodleſs Creatures, as to the States of their vital Parts, and their Souls.

It appears that Inſects have fiery Souls, becauſe they want Sulphurous and Nitrous food.

Firſt, Therefore in earthly Inſects, altho indued with a ſmall bulk that they have great Souls, their Actions teſtifie, which indeed are performed by ſome of them, as the Silk-worm, the Bee, the Ant, or Emmet, the Spider, to admiration: Further, That the Souls of theſe are of a certain fiery nature, no leſs than thoſe of the more hot and perfect Brutes; we from hence deſervedly ſuſpect; becauſe they ſtand in need of a Copious Food, after the manner of an inkindled Flame, and of the acceſs of much Air. The firſt appears by common Obſervation, for as much as Inſects often devour all the Corn, and Leaves of Plants, and ſo take away the grateful greenneſs of the Summer. Beſides, it appears from hence, that their Lives require a conſtant afflux of Air, becauſe as it hath been experienced by our noble Mr. *Boyle*, Inſects being put into a glaſſy Globe, quickly dye, after the Air is ſuckt out. This the Learned *Malpigius* hath more fully declared in his moſt ingenious Tract of the Silk-Worm: where he Obſerves, *That Inſects have not only Lungs, but ſo abound in them, that every little ring or ſection of them is indued with two, yea and that every part alſo of the* Viſcera *or Inwards, delight in the derived Lungs.* For as in the ſides of Inſects, the whole length of the Body on both ſides, black ſpots or pricks appear, he hath found, that theſe were indeed tunnels or breathing holes, leading from ſo many Wind-pipes or aſper Arteries, which by and by, being branched forth into the Heart, Ventricle, Spinal Marrow, and all the other Inwards, and Internal parts, carry in and out air to and from them all. Moreover, if theſe orifices be all ſmeared over with Oyl, or Hony, the Worm preſently dyes; but if only a part of thoſe breathing holes be ſo ſtopped, the neighbouring parts being by and by Convulſed, and then reſolv'd or looſned, ſink down or flag, the reſt keeping their motion: But if the orifices of the *Trachea* or Wind-pipe be untouched, and that the Head, Mouth, Belly, or any other parts be ſprinkled with Oyl, neither death nor any trouble of the Senſe will be induced; and what is yet more wonderful, the Inſects that have oyl or the like poured into their Wind-pipes, ſo ſuddenly dye, that tho the Heart keep a motion for ſome ſpace, yet they can never be revived. Theſe *Phænomena* happen alike not only in the Silk-Worm, but in Waſps, Bees, Graſs-hoppers, Locuſts, Caterpillers, and other the like Inſects, which certainly, I believe, gives very much Light concerning the uſe of Lungs, in every Animal: But firſt let us inſpect ſome other Parts of Inſects, deſcribed by a moſt accurate Anatomy.

Malpigius de Bombyce, p. 28.

Theſe have Lungs, or numerous wind-pipes, the Orifices of which, if ſtopped up by Oyl, preſently death follows.

The Heart of the Silk-Worm is long, unequal and ſtretch'd forth thorow the whole Body.

Therefore he ſays in the Silk-Worm, and the like in others, That the heart is placed all along the Back, between the Muſcles and the Lungs, here and there appending, and that it is ſtretched forth from the top of the Head to the extreme part of the Body; This conſiſting of their Membranes, as appears as it were one Tube or Pipe, but unequal, to wit, ſometimes broader ſometimes narrower, continuing from the Tail to the Head, ſo that for their inequalities, they ſeem as ſo many Eggs, or little Hearts, one laid by another, and continued by one paſſage. Theſe little Hearts, or the aforeſaid parts of the Heart, do gently drive forward, not at once but ſucceſſively and ſlowly (after the manner of their membranes) being bound and dilated from heart to heart ſometimes upward, ſometimes downward, the contained vital humour, which is limpid or clear, and ſo (as we may believe) a certain portion of the vital humour, being ſqueezed forth into the Arteries (which are ſo ſmall and few, that they cannot be ſeen) is agitated by the Circulation of the reſt, contained almoſt only within the oblong Cavity of the Heart.

The Brain is wanting, the Spinal Marrow being ſufficiently large.

As to the head, this moſt diligent ſearcher obſerved, that Inſects had no Brain within the Skull, its Cavity being filled with the Muſcles of the Eyes, and ſome others, but its ſpinal Marrow ſufficiently large, and divaricated in many places, for the going out of the Nerves, and as it were protuberated with knots, is extended from the Head to the Tail; and what is worthy to be noted, in the whole paſſage, branches of the Trachæa or Lungs were ſuperinduced to this ſpinal Rope, and inſerted to it in very many places. I omit what he moſt learnedly diſcourſes of the members, ventricle, and other Inwards of Inſects, leſt it ſhould ſeem impertinent, or too much Plagiariſm: But that the diſcourſes may be the better underſtood, concerning the vital parts of Inſects, it will be convenient here to borrow the draughts of the heart of the Silk-Worm; and of the Trachæa or Wind-Pipes, both of that and of the *Graſs-hopper*, and Locuſt (in which the Tra-

chæa

chæa or Wind-pipes are like to other Insects) most diligently delineated by *Malpigius*; which shall be added at the end of this Chapter, with other Figures of other Animals; but these the first Table shews. Further, as to what belongs to the Doctrine of the Soul, we may with the Authors lieve Philosophize, or at least conjecture, concerning the Phænomena of the Heart and Lungs by him described.

The Use of the Parts is exposed.

Therefore, for that Insects first having such copious Lungs dispersed thorow all the Viscera or Inwards, Heart, and spinal Marrow, to which that each might come distinctly, they have many distinct Trachæas or Wind-pipes, with so many gaping orifices, on the superficies of the Body, it appears from hence, that the use of the Lungs in these little Animals, is not for the refrigeration of the Blood, or its exact mistion, nor for the suscitating the motion of the Heart; because, neither the Vessels carrying the Blood or Vital Humour, accompany the Trachæa or Wind-Pipes, nor is such a humour to be rapidly Circulated, but seems to be only carryed and placed gently into all the parts.

Why such numerous Wind-pipes.

But that the orifices of the Wind-pipes being stopped, presently Life is extinguished in these (as also in a glassy Globe empty of Air) what can one imagine else, but that this access of Air, is required for the sustaining of the Vital Flame, as it is wont to be for that of the Chimney? Wherefore, because the vital humour (which is not at all or only slowly Circulated) cannot be carried all quickly to one Fire-place of accension, as in more perfect Creatures, therefore very many Lungs gaping every where outwardly, and dispersed every where inwardly, are framed for the bringing of Air to the several portions of the vital humour, planted on all sides; for that not only the Heart, but also the Ventricle, Genitals, spinal marrow, and all the other parts of the Soul dispersed, growing with a kind of silent Fire, are inspired with the admitted Air, to every one a part.

Wherefore the Heart is so long.

Besides, when as the vital humour cannot be Circulated into all the other parts, and from these into that, with a rapid motion therefore, instead of a Conick Muscle, which receiving the watering juyce, may be able to explode it presently, and to cast it forth a great way on every side, a Tube or as it were a membranaceous Sack or Bag is made, to wit, which by a long tract stretching it self nigh to all the parts, and to which it might by degrees bestow what might suffice, and in the mean time g ently moving the provision chiefly contained in it self, preserves from stagnation or putrefaction. Further, the little Branches of the Trachæa, deeply inserted into the Membranes or Coats of this, inspire or rather inkindle the humour contained with vitality.

Bloodless Creatures belonging to the Water.

As to the aquatick bloodless Creatures of the other kind, *viz.* some soft Fishes, also many, perhaps all shelly and crusty Fishes; I have not yet happened to see the former, but *Severinus* being my Author, the *Sepia* or *Cuttle* Fish is made with an heart and gills, and the *Polypus* or *many feet* with it and Lungs: what is to be met with that is more curious in the framing of them shall be omitted. Concerning the other two Fishes, to wit, the shelly and crusty, we shall add some Anatomical Observations, such as we have search'd out in their vital parts, and other beginnings, truly weighed, and what the souls are of these sort of bloodless Creatures.

Soft Fishes.

The Anatomy of the Oyster.

Of the testaceous or shelly, though it hath been dissected by many, we shall make choice of the Oyster. The body of this Fish, though it seems rude and wholy without shape, yet it hath all its Viscera and parts, and especially the Præcordia, for, as it were the hearth and Tunnel of the Vital Fire, most curiously framed. As we shall describe some of the chief of these, we will begin with the shells, which are born with them, from Eggs, and are first soft, and as they encrease in bulk they are by degrees hardned: A robust Muscle being implanted in the middle of the Oyster, grows by its tendons to either shell. The moving Fibres of these (which seem as it were a little bundle of Chords or Strings) ascending rightly, whil'st they are drawn together, strictly shut up the shells; but being relaxed, they suffer them to be opened and lifted up; to which Office of opening the shells, another Muscle adjoyned to this, is required. Besides these upright Muscles, and perpendicular to the planes of the shells, there are two Circular, stretched forth by the brims of either shell; which in the same place comprehending in themselves Gills, serve chiefly for their motion; as we shall shew by and by.

The Muscles opening and shutting the shells.

Circular Muscles moving the Gills.

The Mouth of the Oyster.

The Ventricle of the Oyster.

The Liver and Mesentery.

On the top of the Oyster, the Circular Muscles being united, make a thing as it were a Vail for the covering of the head; then being a little divided below, they include four superiour Gills: In the middle of which, a gaping chink leads by an oblique process to the mouth of the Oyster. From the Mouth there is a short and strait passage to the Ventricle. The Cavity of this large enough, is endued with little holes, leading into darkish bodies, fixed on either side of it. These bodies seem to be in the stead of the Mesentery and Liver, and to perform their offices; to wit, for that they receive

the more pure part of the Chyle, by and by from the Ventricle, and deliver it, being made clear from dreggs, to the vital humour. The like is in cruſtaceous Fiſhes, and perhaps in ſome Brutes; to wit, in ſuch as a ſimple and only Inteſtine, without folds and Meſeraick or milky Veſſels, is produced from the *Pylorus* to the great Gut or Ars-hole.

The Inteſtine.

For ſo in the Oyſter, the Inteſtine beginning from the bottom of the Ventricle, deſcends with a plain and equal Tube, towards the right Angle of the ſtreight Muſcle, where being rolled and retorted in it ſelf, it aſcends again towards the Ventricle and Liver; being from thence demerſed, and bending back towards the left ſide, goes towards the border of the ſtrait Muſcle, till it ends in the great Gut or Arſ-hole: After this manner in the Oyſter, a ſimple and only Inteſtine is carryed about, with a moſt long compaſs, more than in many other Animals, by which indeed they may be able the longer to retain their Dung; to wit, leſt that when they are dry, that being more importunely put forth ſhould polute (by mixing with it) the water, for the food of life, included in the ſhell.

An Inteſtine in an Inteſtine. Which perhaps is the Spinal Marrow.

This Inteſtine being diſſected and opened longways, in the bottom of it ariſes an hardiſh and almoſt round body, which aſcending from the Arſe to the Ventricle ariſes there, and ſtretches under the *Oeſophagus* towards the Head: The like to this is found in a Worm, which hollowneſs in it we think to be in the place of the Meſentery and milky Veſſels: but otherwiſe in the Oyſter, this hard and compacted body being leſs apt for ſuch an office, ſeems not unlike to the ſpinal Marrow: But we ſhall ſhew the Chyliferous paſſages do ſupply the darkiſh bodies, hanging to the Ventricle.

Its Pericardium with the Heart and Veſſels.

Below the Ventricle, the *Pericardium* is placed, including the Heart, being whitiſh with a large black ear, which being opened, that is beheld to beat, and at every *Diaſtole* to admit the vital humour, out of the hollow vein, into the little ear; then at every *Syſtole*, to drive the ſame forward into the *Aorta*, placed on the contrary ſide; then by tripartite branches of this Veſſel, a certain part of this humour tends upwards, towards the Head, Liver and Stomach; alſo a certain portion is reflected into the ſtrait Muſcle; in the mean time a great part of it being delated from the great Trunk of the Artery, to the *Branchiæ* or Gills, it is there unfolded, within moſt ſmall and numerous paſſages, as it were little Rivers, that it might enjoy, according to all its parts, little nitrous bodies inſpired from the water. And that this may be the more plentifully done, we obſerve that the water, as in bloody Fiſhes, did not only waſh the outward ſuperficies of the Gills; but that it every where did enter all the more intimate receſſes, and deeper paſſages; yea theſe Gills expanſed largely thorow the Hemiſphere of the Oyſter, exceed in bulk, all the other Viſcera, alſo almoſt the parts. So that in Fiſhes, becauſe they breath but little in the water, it is ſo provided that in many places together, the food of reſpiration ſhould be afforded them.

The Gills.

The Deſcription and uſe of them.

There are Four hairy tufts of Gills, and as it were two Lobes of either of them; to wit, the upper more broad and thicker, and the lower which is thinner and a little more contracted; in all the paſſages of them, every one is two-fold, and contains two ſeries of little Finns, ſeen to grow together; to the ſeveral Gills belong two Veſſels, the Artery and the vein; which being depoſited in the heaps of the hairy tufts, diſpoſe the ſmall ſhoots of either kind thorow all the borders. But beſides theſe Four orders of Veſſels, there are found alſo ſo many ſeries of little breathing holes, lying between theſe Veſſels; which alſo by manifeſt paſſages open in the places between the Finns: and from thence they deduce the waters ſup'd up by the inferiour mixture or joyning of the Circular Muſcles: The like is in cruſtaceous Fiſhes, as we ſhall ſhew by and by.

The motion of the Gills depends upon the Circular Muſcles.

As to the motion of the Gills, it is clear by ocular Inſpection, that the Circular Muſcles, which are knit to either ſhell, for the ſhutting them, when relaxed, do reach to the extream brims of the ſhells; whereby at that inſtant, alſo the Gills being relaxed, they imbibe the Waters, and together from them draw the nitrous food; and by and by being contracted, they are drawn inwardly, and together compel the Gills, to the preſſing forth the Waters newly admitted.

Shelly and cruſty Fiſhes, contain waters in their whole bodies, to wit, whereby they may be able to live out of the Waters.

If the Reaſon is asked, why ſhelly Fiſhes (which alſo holds with the cruſtaceous, as we ſhall ſhew anon) have beſides the Veſſels carrying about the vital humour, alſo Paſſages or open Chanels, by which the Waters are carried to their moſt intimate receſſes; it ſeems to be becauſe both theſe ſorts of Animals, though they reſide at the bottom of the Sea, yet oftentimes they happen to remain dry, therefore that they might then breath (the moſt wiſe Creator ſo providing) they contain plenty of water within their own frame, as it were repoſed in Wombs; by the during proviſion of

which,

which, they live as well in the open Air, as in the Waters; But these Waters being taken away, shed, or evaporated by heat, both these sort of Fishes quickly dye: By reason of these Waters, these live longer then others out of the Waters. Further, as the Noble Mr. *Boyle* hath obsery'd, the Oyster and the Sea-Grab, being put into a Glassy Globe, after the Air was suck't forth, did not presently expire like many other Animals; to wit, because part of the Intestine Water being rarified, quickly supplyed the defect of the exhausted Air; at least, that being detained within the proper frame of the Fish, affords an inkindling or matter for respiration. It is sufficiently known, that the Oyster, when it is taken out of the Waters, hath a great quantity of Waters shut up within its shells: as also the Lobster (which we intend to consider of among the crusty Fishes) doth the same thing, as shall be declared. In the mean time, for the illustration of this our Anatomy of the Oyster, *Tab.* 2*d*, shews the Figures of its parts aptly represented.

The parts and Viscera of Fishes swiming backwards are inversed.

The *Lobster* and other Fishes a-Kin to it, *viz.* the *Crab*, *Sea Creevish*, *Shrimps*, &c. As they retrograde, or rather swiming backwards, so their parts and Viscera in respect of other Animals, seem to be inverse or opposite: For as to the members and moving parts, the bones are not covered with flesh, but the flesh with bones: wherefore, almost all the Muscles of the Feet, Arms, Head, Back, Tail, and other parts, either moveable or moving (excepting those that are temporal) are shut up every where with a crusty covering: Indeed it is so ordained by Divine Providence, that as these Animals inhabit among Rocks and sharp Stones, lest they should be in danger of being dashed too hard by the force of the Tides, they are fortified with Bones, planted outwardly, as it were with Armour: Moreover, lest that the crusty Covering should more sharply compress the Membranes, or the Flesh underneath, or should rub against them, the same is every where covered within with a thick Purple Muck or Stuff, as it were lined with a soft cloath: I do believe this purpuling in crusty Fishes, otherwise than in soft (who also are besmeared with muck) to happen through the greater plenty of Sulphur.

As their Bones and Flesh, so their *Præcordia* and *Viscera*, are observed to be *Histeron Proteron*, topsie turvie; for the Liver, Stomach, and Womb is placed above, and the Heart below, yea contiguous to the Back: yea, and the spinal Marrow lyes not close to the Back, and above the Viscera, but under them, and to the prone part of the Body, in its whole passage; and is included in the bones or jointings of the Sternon, or meeting of the Breast.

The Brain of the Lobster.

But that the Parts and Viscera of the Lobster may the better be beheld, let the armed coat with the red Muck and Membrane lying under it, be taken away; then in the top of the head, appears the Brain but meanly large, of a greenish colour, and as it were two-fold; from which the mammillary Processes, and the Optick Nerves ascend, and two shanks of the oblong Marrow descend into the spinal Marrow, and in its whole process, they are sometimes divided, and sometimes placed together, now united, and then again seperated one from another.

The Nerves and spinal Marrow.

The Oesophagus.

The *Oesophagus* tends from a two-fold mouth, by a strait and short passage, into the Ventricle, this large indued with a thick and strong Membrane, has three Teeth within its Cavity, by which its aliments are chawed or bruised: further, for the work of Chawing and brusing, two pair of muscles are framed, in the neighbouring parts, to wit, one temporal or belonging to the Temples, and another hanging to the sides of the Stomach; from the sides of the Stomach or Ventricle, grow too glandulous Bodies, stuffed with many Vessels and various passages, as it were certain little thin Intestines, and from thence being by degrees sharpened with two Lobes, they descend into the lowest Trunk of the Body; from the Stomach into these Bodies, on either side, passages lye open, so that wind being blown into it by a Pipe, presently it runs into these and makes them swell up: These parts in crusty Fishes (as also in the shelly) are commonly called the Liver, and indeed they seem to perform the Offices both of the Liver and Messentery; to wit, for as much as they receive the more pure portion of the Chyle fresh digested in the Ventricle, and commit that by and by, being made purer, to the vital humour. *Malpigius* observes in the Silk-Worm, and in other Insects, that certain diversified Vessels, analogical to these Bodies, are stretch'd out through the back of the Ventricle, and from thence to reach lower upon the Intestine; which (as he probably thinks) receive the more thin portion of the meat already macerated and loosned in the Ventricle; and deliver it, the juyces perhaps being not much changed, to the Heart, or at least to the Skin and other parts of the Body. Truly by observation, after what manner these parts which supply the place of the Liver and Messentery, in some Fishes and Insects are made; something may be thence gathered concerning the uses of the Liver, and of the Vessels both Miseraick and Milky, in bloody Brutes.

The Ventricle from which there is a passage into the Liver and Messentery.

De Bombic. p. 40.

Things answerable to the Liver and Messentery in Insects.

Spermatick Bodies. In the Male Lobſter, above the beginnings of the aforeſaid parts, on either ſide, from the ſides of the *Oeſophagus*, the ſpermatick Bodies begin, which being ſent down towards the bottom of the Trunk, and there being more compacted and made ſmoother, after the likeneſs of the *Epididimis* or thin covering of the Teſticles, are terminated in two Yards; the Tops of which have their going out thorow holes forged in the laſt little feet but one. In like manner in the Female Lobſter, two neſts of Eggs on either ſide of the ſides of the *Oeſophagus* and Ventricle are placed, and paſs into two Wombs planted in the loweſt Trunk of the Body, and into thoſe, thorow the holes forged in the laſt little Feet but one, there lyes a paſſage to the genital Members, alſo a paſſage from the Womb for the laying of Eggs: ſo that it appears how theſe living Creatures are moſt fruitful, with a multiplyed Iſſue, when as nature ſeems to be careful and induſtrious about their genital parts, being double and greater than in many other Brutes; to wit, that as they being both at once double, they might produce both by the works of Generation, Conception, and bringing forth not only always Twynns, but almoſt *Miriads* of *Twynns*.

Two Yards in the Male.

Two Wombs in the Female.

The Pericardium and Heart. Below the Ventricle, yea and lower alſo then the beginnings of the other Viſcera, the *Pericardium*, in which the beating heart is included, is placed in the bottom of the Back; the *Syſtole* and *Diaſtole* of the heart are ſtrong and ſwift, as in Creatures of Blood; this appearing of a whitiſh Colour, is indeed a *Conick* Muſcle, whoſe Cavity being ſufficiently large is framed with Fibres or Columns, alſo with many ſtrong and various little Furrows: The *Aorta* going forth from its top, is cleft preſently into two Branches, which go towards the Gills; The *venæ cavæ*, one aſcending, the other deſcending, meet together from the bottom of the Heart, and there enter into its little ear. The Heart whilſt it is relaxed, receives the vital humour from the vein, and by and by when it is contracted, drives it forward into the *Aortæ*.

The Aorta.

The Gills. The cruſty Fiſhes, even as the ſhelly altho without Blood, are indued with numerous and large Gills, which are inſtead of Lungs; to which, that all the Vital humour may be frequently carried, therefore not as in earthy Inſects, are they diſperſed thorow the whole Body, but on either ſide, under the brim of the armed coat, and being gathered together in one place, are made into certain little bundles: The inferiour and utmoſt part of the Gills, which are broad and obtuſe, is fixed to the *Sternon* or meeting of the Breaſt, with hanging little feet; the upper part aſcending under the Coat is looſe and free, and by degrees grows ſharp; otherwiſe than in Fiſhes with Blood, whoſe Gills are tyed together, being ſolid at either end.

The Gills of the Lobſter have three Boſoms. In all the Gills of the Lobſter, Three Boſoms are found, of which two ſeem to be made for the carrying in and out of the vital humour; becauſe a black Liquor being injected into the heart, paſſes to the Gills, and there paſſing firſt thorow one Boſom, returns by and by thorow the other. We will ſpeak by and by of the third: from theſe Boſoms appear productions of ſmall Veſſels, as if it were feathery, ariſing on every ſide, thick ſet and ſhort, like jagged welts or fringes; which being ſpongy, ſup up the Waters continually flowing to them, at every turn of the *Diaſtole*, and preſs them forth by *Syſtole*: to wit, for the end, that whilſt it is there unfolded within the ſmall paſſages, the food for the vital humour may be inſpired. The Third Boſom being carried from the top of every Gill, to its Baſis ends in the common Channel, in all the Gills of the ſame ſide, which nigh to the inſertion of the higheſt Gill (which beats perpetually) gapes with a large gap; Any one may eaſily perceive this, in a live Lobſter, whilſt it breathes out of the water; for in every *Syſtole* or pulſe of this ſupream Gill, one may ſee a bubble of water break forth out of that hole. Further, if into that hole a black Liquor be injected, by and by entring under that Common paſſage, it paſſes thorow from thence, both into all the Gills, and the ſmall and feathery Boſoms of them, and alſo into the Arms, and all the little feet (the Cavities of which the Muſcles do not fully ſtuff) yea, and into the Cavity of the Body. In like manner wind being blown into that hole, all the aforeſaid parts will be inflated or blown up.

Two of theſe carry about the Vital Humour.

The third receives, and caſts out the Waters flowing to it.

Shelly and Cruſty Fiſhes receive the Waters, that when they remain dry, they may be able to live. From hence we may gueſs, that hole, with the common channel, and the three boſomes of Gills, to be a certain *Trachea* or Wind-pipe, into which plenty of water entring at every *Diaſtole*, is returned back at the next *Syſtole*: In the mean time, theſe waters in this paſſage, do not only Communicate with the Vital Humour, abounding between the Gills, but beſides, are laid up between the Cavities of the Members and the Trunk, that they may ſupply theſe Fiſhes, whilſt they are kept dry with matter for reſpiration; and therefore, they not only longer ſubſiſt in the open air, but alſo live for ſome time in a place void of all air.

In Cruſty Fiſhes, for that, for the agitating the Gills as it were with Lungs, the Ribs belonging to the Sides, the Muſcles of the Breaſt, and other things are either wanting,

or

or by reaſon of the ſtiffneſs of the neighbouring parts, are made unable; it is performed by an admirable artifice, as whilſt the Gills, for the moſt part being looſe, and are left eaſily moveable, the ſeveral little bundles of them, about the baſis of the bony little Foot, being included with the Muſcles, within their Cavities, as it were ſo many hanging Ribs, are fixed, being drawn forth far beyond the Trunk of the Body; which, as ſo many diſtinct Pendulums, by the help of the Muſcles, which they include, being almoſt continually ſhaken, cauſe alſo continual *Syſtoles* and *Diaſtoles*, for the inſpiring and exſpiring of the Gills.

The Gills of Cruſty Fiſhes, hanging from the Sides or Ribs, are moved as it were by ſhaking Pendulums.

But it may well be doubted, whether we ought to aſſign Souls of the nature of fire, to theſe bloodleſs Creatures inhabiting the waters; becauſe they rejoyce in an Element that is deadly to fire it ſelf, and to the Lives of more perfect Brutes: But this Problem ſhall be ſatisfied by and by, when we have firſt diſcours'd of the Uſe of the Gills in Bloody Fiſhes, as alſo concerning the *Præcordia* of theſe, and others, of a more frigid blood: In the mean time, the Third Table ſhews the Figures, repreſenting to the Life the parts of the Lobſter.

Whether there be fiery ſouls in bloodleſs Creatures.

Secondly, After the bloodleſs Brutes, their ſecond Claſs, and of a little higher degree, is that of the more cold bloody Creatures; in which for that the vital Humour or Liquor, being dyed with a reddiſh tincture becomes bloody, it ſeems to proceed from a greater plenty of Sulphur, and chiefly deſtinated for living Creatures, for the increaſing their bulk and ſtrength: For where blood is, though in a mean Plenty, their Muſcles, Inwards, Præcordia, Brain and more ſtrong and compleat Organs of the ſenſes exiſt. We have obſerved it otherwiſe among moſt Inſects, whoſe little Bodies being ordained to ſubtle and ſmall actions only, are made up of very little Sulphur, as their *Analyſis* or the unfolding them ſhews, but of plenty of Spirit and of volatile Salt.

From whence the vital humour becomes bloody.

But that among the Bloody Brutes, ſome are hot in Act, and others are frigid or cold, the reaſon may be, both from the quantity of Sulphur, to wit, with which they are only meanly or very much imbued, alſo from the Kind of life which they live, either in the Air, or in the Waters, or within the Earth: Wherefore, the Inhabitants of the latter Regions do not grow hot in the Act, yea 'tis ſcarce poſſible they ſhould; for how, or which way ſhould heat ſubſiſt, where it is in danger to be damped or overthrown by a more potent Cold? Wherefore, the blood of Animals deſtinated to theſe places, is tempered with little Sulphur, leſt otherwiſe growing hot above meaſure, it ſhould be forthwith ſuffocated; yea and we ſuſpect the Souls of theſe, tho of a firy nature, to have not a flamy *Hypoſtaſis*, but a breathy, to wit, which conſiſting in Vapour, hardly or not at all inkindled, like an *ignis fatuus* or falſe fire, is deſtitute of ſenſible heat.

Why the bloody Brutes, are ſome of them more hot Animals, others more cold.

The more Cold bloody Creatures, altho all of them have a *Conic* Heart, very fibrous and thick, to wit, that being ſtrongly Contracted, it might drive forward the Vital Liquor, by a certain Circulation, into all the parts, and from them into it ſelf: yet this Heart in ſome is two bellied, and to it always the Lungs are hung; in others it hath but one belly; and in many, in the place of Lungs are Gills, but in ſome there are numerous Wind-pipes, and diſperſed thorow the whole Body: We ſhall conſider the different ways and buildings in each of theſe.

Why ſome are indued with an heart, with a twofold Belly, & Lungs; others with one Belly, and Gills, or Wind-pipes diſperſed.

Among the Brutes of Cold blood, The Earth-Worm, tho of the loweſt order, may be rightly placed; for that its humour appears by occular inſpection to be bloody: This little living Creature, tho it be eſteemed Vile and Contemptible, hath allotted to it vital organs, as alſo other *Viſcera* and Members, made moſt admirably by a Divine Workmanſhip; the frame of the whole Body (even as of many bloodleſs Inſects) is a chain of ringie Muſcles, the orbicular fibres of which being Contracted, render every Ring firſt large and dilated, and then more narrow and longer. For then, when the ſuperior portion of the Body being made long and ſtretched forth, is extended to a further ſpace, and is there affixed to the plane, the inferior portion of the Body, being relaxed and abbreviated, is eaſily drawn to it, as to its Centre. A four-fold ſeries or rowes of little feet are placed thorow the whole length of the Worm; with theſe, as it were with ſo many hooks or claws, he fixes now this part, now that, to the plane or ſuperficies, whilſt he ſtretches forth the other, or draws it after him. Above the opening of the Mouth, he is indued with a ſnout, with which he diggs thorow and thruſts up the Earth.

Deſcription of an Earth-Worm.

Its local motion.

The little Feet.

Its Snout.

The Earth-Worm, being laid on its back, and fixed with Bodkins to a Table, let it be cut up long ways, then the Sides being layd apart, its parts from the head to the tail eaſily ſhew themſelves to your view. Above the opening of the Mouth, the Brain appears in a very little Bulk, and whitiſh like a bubble: Then a little lower, the *Oeſophagus* being placed with the Muſcles, deſcends thence with a ſtreight paſſage to the Ventricle.

It's Brain.

Oeſophagus.

Nigh

Pericardium and Heart.

Nigh to the top of the *Oesophagus*, the Heart beating is placed, having reciprocal turns of *Systole* and *Diastole* or pulses, as in more perfect Brutes: from either side of the heart, and from thence a little lower, are framed whitish Bodies, and something globous or round, and on either side distinguished as it were into Three Lobes. The Two superiour of these, shine more bright and are smaller; the lowest little Globe, greater in a double measure then either of the other, is long and like a Sawsage; between these whitish Bodies, and more backward, other lesser little Globes as they were small and little yellowish whelks, are placeed in a two-fold series, to wit, on either side, now Four, now Five, or more. Noted Blood-carrying passages go thorow the midst of these Bodies, and in them a notable pulsation, as it were in the neighbourhood of the heart, is beheld.

White Globes which are Spermatick Bodies.

By what names I should call the aforesaid parts, and for what uses they served, I was a long time in doubt, because in the dissection, or by blowing them up with a Pipe, I could find no Cavity in them; but some of the little globes being opened and squeesed, there dropt out of them a milky humour, from whence I presently suspected, that they were spermatick Bodies; which seemed likely, because these parts were not formed after the same manner in all the Earth-Worms. Further, it was sufficiently obvious, that Earth-Worms Coupling together, do not strain themselves as most of the other Brutes, by a direct planting of either Sex about the Tails, but on the contrary, by mutual embraces about the Head. At length, after I had often and narrowly inquired into the matter, it appeared past doubt: For by chance dissecting a certain bigg-bellied Worm, I found the greater white shining Bodies, and the longish like a Pudding or Sausage, stuffed with very many Eggs: Moreover on the other side of these Bodies, in the Breast of the Earth-Worm, appeared two white shining little Paps, with holes, which seemed to be the privy members of the Earth-Worm. *Malpigius* hath observed, in *some Insects, and especially in the Beetle and Imperatus's Mole, certain little whitish Globes about the Ventricle* (like as it seems to these in the Earth-Worms) *to be found, and a portion of it, to be incompassed with plenty of them*: It is very likely that these Bodies are also spermatical in them.

The like to these in other Insects.

The Ventricle, of which there are three Bellies &c. The Intestine.

Below these whitish shining Bodies, the Ventricle, of a noted bulk, is placed, indued with a large Cavity, and divided into three Regions or Bellys. From the lowest of these, the *Intestinum* proceeding, is carried by a streight and long passage, even to the Tail, and in the whole space is so compressed, by the several interspaces of the anulary Muscles, that it appears like the *Colon* or Arse-Gut in perfect Animals, divided as it were into very many little Cells. This *Intestine* being dissected long ways, and the dung removed, in its bottom was placed a vessel, in its whole passage, of a yellowish Colour, from the Tail even to the Ventricle; but in the same place arising up, and creeping thorow the walls of the Stomach, is stretched forth even to the Head: This Vessel is in truth a *Tube*, which being blown up by a Pipe, shew'd an ample Cavity; and that which *Malpigius* noted to be stretched forth upon the *Ventricle* and *Intestines* of Insects, seems answerable to these passages and vessels, and we may well suspect it to be in the place of the Liver and *Mesenterie*. In some Earth-Worms about the Tail, on either side of the *Intestine*, we found sometimes very many Eggs, ready to be lay'd, which indeed were seen to have descended thither, from the genital parts, and were cast out by the Passages lying open into the Arse.

An Intestine in an Intestine, which is in the place of the Liver and Mesenterie.

The holes in the back of the Earth-Worm, which seem to be Wind-Pipes.

So much concerning the internal parts of the Earth-Worm, opened with its Belly upwards: If the same be held down with its Belly downwards, on the top of the Back, near the brim of every Ringlet, little holes are continued; almost in the whole Passage, from the Head to the Tail; into which, if you blow with a Pipe, presently the underlying parts swell up, the dung of the *Intestine* being driven up and down here and there, backward and forward: From these holes, if they are pressed, a white, viscous, and sometimes a milky Humour drops forth, which seems to be muck or stuff besmearing those Cavities, and fortifying them against the inclemency of the Air.

Without doubt these little holes are so many Wind-Pipes, which as in bloodless Insects, being numerous and dispersed thorow the whole Body, supply the place of Lungs, and draw in the nitrous Air for the inspiring the Vital Liquor, and by and by sends it forth being spent. But against this it may be objected, That little and sometimes almost no respiration serves the Earth-Worms. Because they sometimes lye hid in the depth of the Earth, for above three Months, and are able so to ly and to live; yea, if the holes of the Wind-Pipes be smeared over with Oyl, they do not presently dy like the bloodless Insects; but being immersed in Oyl they swim in it unhurt, and live a long while; but if you apply heat to them, tho moderate, they dy presently: The same thing we have observed almost of Fishes, and especially of the Shelly and Crusty, who bear the defect of Air or Water, better than the presence of Fire, or Heat.

The

The reaſon of this (that we may defend our *Hypotheſis*) we ſhall indeavour to ſhew; we have ſhewn in a late Tract, That altho Fire and Flame neceſſarily require, beſides Sulphureous food from the matter of the Subject, ſomething nitrous from the Air, which being denyed or withdrawn, they are ſuddenly extinguiſhed; yet, if that the matter be inkindled of Sulphur and Nitre (as is wont to be in Gun-Powder) together mixed with the Concrete, that Fire or Flame will burn in the midſt of the Waters, or in a place Empty of Air; to wit, becauſe either food being contained within, they do not preſently deſire ſupplyes from without. In like manner we ſuppoſe it may be concerning the *Hypoſtaſes* and accenſions of Brutal Souls: For altho many of theſe being inkindled in their vital humour, draw in altogether from the ambient Air, a Nitrous, and from within a Sulphureous Food; Yet in the blood of ſome of them, which are deſtinated to the Waters or to the Earth, much of Sulphur thick and Earthy, with little of Nitre, and very little only of ſpirit and volatile Salt, may be ſo temper'd that it being inkindled into Life, may burn with a ſilent and almoſt ſuppreſſed fire; neither requires from without the acceſs, either of much or continued nitrous Food, but, as it hath a certain inteſtine task, its burning is more ſecurely performed in the Earth or Waters, than in the open Air: For that indeed from this, there is danger of too much inkindling the ſulphureous Particles, and ſo quickly of overturning the *Craſis* or diſpoſition of the Soul: Wherefore, theſe kind of Animals greatly abhor fire or external heat, which may make the internal Sulphur to work, and too much to burn. However, altho the Souls of theſe are not contented with fire, and it ſometimes as it were hid in the Aſhes, ſuffers them to be nummed or ſtiff; yet notwithſtanding, Organs of Reſpiration are given to them all, for the continuing it aslong as it pleaſes, and as occaſion ſerves for the increaſing or repreſſing it. And indeed the Creatures of a more frigid blood, appear to be conſtituted or imbued with plenty of Sulphur, tho ſparingly inkindled, becauſe Earth-Worms and Fiſhes, quickly putrifying, yield a moſt ſtinking ſmell; and the putrified fleſh of ſome of theſe, by reaſon of the very many Effluvia's of Sulphur, ſhine in the dark like a live Coal. Moreover, it hence appears, that the ſaline Particles, which make up the temperament of theſe, are for the moſt part nitrous, and beſtowed for the food of Life; becauſe from the bodies of theſe, diſſolved by Chymical operation, you can neither draw a Volatile Salt, as out of all Other Animals, nor a Fixed. The Images of the Earth-Worms, ſhewing their Anatomy, are deſcribed in the Fourth Table.

Earth-Worms and Fiſhes, abound in nitrous Salt, being almoſt wholy deſtitute of a fixed and Volatile Salt.

In the next degree of the more frigid bloody Creatures, above Earth-Worms, Fiſhes are placed, indued with one belly'd Heart and Gills. If indeed Lungs be wanting to theſe, the other boſom of the Heart were ſuperfluous. But moſt Fiſhes want Lungs, both for as much as living in the Waters (whoſe medium is not fit for ſounds) they have neither voyce, nor make a noyſe, and chiefly, becauſe the water ought not to be emitted thorow the Wind-pipe, into all the Cavities of the Lungs, if they had them; for that by watering them, or overflowing them, it would preſently overthrow them, and fill them to a ſtiffneſs: But as in Brutes with Lungs, the Air being admitted within it, ſlides thorow all the blood-carrying Paſſages every where; that entring the little mouths of the Veſſels, every where gaping, it inſpires the Blood with nitrous food; ſo the Gills in Fiſhes, which are ſubſtituted as ſo many Lungs, or rather inverted, are ſo placed without the Cavity of the *Thorax*, that the Waters continually flowing to the Paſſages of the Veſſels, and their little Mouths being outwardly planted, whilſt the Gills are inlarged, they inſpire ſomething nitrous, or what is like it, to them; the remains of which, being by and by ſpent, the Gills being contracted, is ſent away again; and ſo by Continued reciprocations of Inſpiration and Expiration as in hot Animals, the Life or the Flame of the Blood is Conſerved.

In the next degree of the more frigid bloody Creatures are Fiſhes.

They are indued with an one Bellyed Heart and Gills.

We have not much to ſay concerning the ſtructure of the Gills, they being already ſufficiently deſcrib'd by ſeveral: As to their fabrick, they are bony ſemi-circles, planted on both ſides of the bottom of the Mouth, nigh to the opening of the Gill holes, which are made hollow quite thorow, with little ditches, as it were quilly, that they may receive the Veſſels ſent to them and much branched forth, and defend them againſt injuries.

The Structure and uſe of the Gills.

The Veſſels belonging to the Gills, are Arteries, and Veins; which in the Sturgion, Salmon, and Cod, are found to be made after this manner: The *Aorta* going forth of the Heart, and aſcending towards the Chin, or end of the lower Jaw, ſends forth branches to the right and the left; ſome of theſe preſently growing forked, accommodate an Artery to two Gills of the ſame ſide, which by and by being again divided, puts thorow two arterous ſhoots, thorow the Bow of every Gill, near to the bony Baſis; then from them, others ſmaller thick ſet ſhoots, tend into the ſides and midſt of every Come-like Finn: After the Gills being paſſed thorow, all the arterous Branches meet together again, and Conſtitute the ſame Trunk, which being by and by reflected, has a

proſpect

proſpect to all the other parts. The Trunk of the *Vena Cava* or hollow Vein deſcending, applyes it ſelf and enters near into the *Aorta* aſcending into the Gills. Further, in the ſeveral Finns of the Gills, leſſer ſhoots, as in the Bows, anſwer the greater paſſages of the Venous, with ſo many Arterous ſhoots. Beſides, from the ſeveral parts on both ſides the Gills, a veinous branch is inſerted into the deſcending Trunk. This plainly appears, becauſe if you open the branches both veinous and arterous, lying on the Bows of the Gills, there will appear a ſeries or row of holes leading into the Finns; Moreover, a black Liquor being caſt into thoſe Arteries, will return by the Veins. Yet I have obſerved, part only of that injected Liquor to turn aſide thorow the holes into the Finns, but another part to paſs directly thorow into the Channels, and thence to flow into the deſcending Trunk of the *Aorta*, which the Gilly Branches being at length all united do frame: From hence I gather, That the Blood in Fiſhes, (not as in Brutes with Lungs) is carried at every Circuit, or paſſes thorow the Veſſels, between the organs of reſpiration, not all, or whole, or is carried from the Arteries into the Veins, whereby the hole might be inſpired anew of the Air; but for that they, as we have ſhewn, enjoy in themſelves a nitrous food partly inteſtine, therefore it ſuffices them, that the blood only be by parts expoſed to the External Nitre flowing to it.

Not all the Blood, but a part only, is carryed thorow between the Gills, at every Circulation.

Fiſhes breath by the Gills.

From theſe alſo it ſeems to appear, That Fiſhes do breath by the Gills, or draw what is nitrous from the Waters, and do enjoy it as it were the neceſſary food of Life; which alſo many other Reaſons do manifeſtly declare: To wit, for that the Waters where Fiſhes dwell, ſtanding ſtill a long time, tend to putrefaction; or if by too much Heat or Cold, or other means, by which the nitrous Particles are wont to be driven away or perverted, they be affected, they Choak their Inhabitants. Further, if Fiſhes be ſhut up in little water, or with too ſtrait limits, alſo if more than ſhould be in the ſame Fiſh-Pond, tho large enough, tho they have plenty of food, they will dye for want of the nitrous food, which alſo argues the Cauſe of their death, for before they dye, they will ſhoot forth of the waters, putting forth their mouths and heads, to take in the naked Air: ſo that it may from hence be Concluded, That there are alſo in theſe Inhabitants of the waters firie Souls; to wit, the *Hypoſtaſes* of which are an heap of moſt ſubtil Atoms, which being ſtirred up into motion, by a certain inkindling, do require, for the Continuing of their ſubſtance, beſides the Sulphureous Aliment within, which they feed on, another nitrous from the ambient Medium.

wherefore Fiſhes rejoyce rather in the Waters, than in the Air.

But that Fiſhes rejoyce in the region of the Water inſtead of the Air, where any one would think that their Flame ſhould be rather extinguiſhed, than inkindled, we gave the reaſon of it but now, to wit, as certain Animals are deſtinated to theſe places, their Souls were ſo temper'd, that as the matter made up of Sulphur and Nitre mixt together, they burn or grow hot under the waters, yea they there live more ſecurely; to wit, for as much as there is in them plenty of Sulphur, it is ſuffer'd to be only ſparingly inkindled, and to burn forth. Further, altho ſome nitrous Particles ſeem to enter into the intrinſick and ordinary food of the vital fire, and leſt the flame, by the defect of theſe, ſhould expire, new ſuppliments are daily inſtilled through the Gills: yet indeed, by reaſon of the divers Conſtitutions of Souls, living Creatures do reſpire after a ſeveral manner, and ſome require this medium more thick, others moderate, and others more thin. And for this Cauſe, ſome living Creatures, whilſt they remain in the ſame number, ſometimes change their ſphere or ambient medium, and ſometimes go out of the Waters into the Air, and ſometimes from this into them. A certain Inſect called the watry *Phryganion*, in ſome places in *England* a *Caddis*, at the firſt of the Spring is cloathed with a Coat of a ſprig or ſmall rind of wood, and creeps into the depth of the Rivers, in the ſhape of a Mite or rather a Maggot; afterwards, when its Soul begins to be ſublimed, he gets to the tops of the Bulruſhes, and in the Month of *May*, riſing up to the ſuperficies of the water, puts off its Coat, and having wings, flyes into the Air, and there lives during Life. Who knows not that Frogs live at firſt in the Waters, in the ſhape of a Tadpole, altogether; then all the Summer do leap about in the Meadows, and that at laſt in the Autumn, returning to the Waters, do bury themſelves in the Mud? After this manner, many more Inſects, do not only change the Region, but alſo vary their Species or Kind, and of Reptils become flying Creatures.

Certain Animals change the Regions of the Air and Water.

Brutes of a more cold blood, which are framed with a Heart with a two fold Belly, and with Lungs.

Thirdly, A little more ſuperior degree of Creatures of a more frigid or cold blood, is thoſe who are gifted with a doubl'd belly'd Heart, and with Lungs; of which ſort are Serpents, Liſards, and ſome Amphibious Creatures, that is ſuch as live on Water and Land, as the Frogs, and ſome Fiſhes, to wit, the *Polypus*, the *Sea-Calf*, with many others. To theſe former, Lungs are neceſſary, becauſe they oftentimes live in the open Air, which always ought to be deeply admitted into the *Præcordia* themſelves; Moreover, becauſe they put forth a certain ſound, for which a Wind-pipe is required; but

for

for as much as Lungs are granted to them, ſo alſo a two-fold belly'd Heart, without which the blood paſſes not thorow the Lungs. As to what reſpects the *Amphibious* Creatures, which at their pleaſure now live on the Land, and now in the Waters, tho it appears that theſe cannot ſtay always, or very long under the water, yet it is to be wonder'd at, how in the mean time they breath; for if they open the Wind-Pipe, the Waters ruſhing preſently in, would drown the Lungs. *Bartholinus* eaſily untyes this doubt, by aſſerting, That in theſe Brutes, an Oval hole as in *Embrio*'s, is kept open all their life-time. *Cornelius Conſentinus* affirms it after the ſame manner to be in Divers, or ſuch as dive under the waters; and he ſhews the manner whereby ſome men may be made able to dive; to wit, if whilſt they are Infants, they be provoked often to Cry, they are ſuffered a long time to reſtrain the ſpirit, from hence there will be a neceſſity of caſting forth the Blood thorow the oval hole or navil, and for that reaſon will hinder its Coalition or Cloſing up.

But indeed in theſe Brutes, as to ſuch a Conformation of the *Præcordia*, the moſt skilful Anatomiſt Doctor *Walter Needham* did doubt, and deſired to have found it in ſome of them by an ocular ſearch, after many diſſections.

On which the faculty of diving depends.

However it is, we are to ſuppoſe theſe living Creatures do not breath, whilſt they are under the Waters; and from thence the Courſe of their Blood is by and by made more ſlow, and ſmaller: In which Condition it matters little, whether it ſo growing tottpid or ſluggiſh, creeps from the hollow vein into the *Aorta*, by the navil hole; or whether lying quiet, it creeps forward by a gentle or ſlow pulſe of the Heart; for either way, there will be a neceſſity, that the Vital fire, for defect of aerial food, would be preſently diminiſhed, and as it were depreſſed into a halituous or breathy ſubſtance: Notwithſtanding in the mean time, that it may not wholly Expire or be Extinguiſhed, theſe two things are done, *viz.*

Firſt, Becauſe in theſe Animals (and as in all Fiſhes) the Vital fire, together with a certain Sulphureous and alſo Nitrous food within (as we have ſhewed) is injoy'd; therefore it is able a long time to want its external ſupplement from the Air.

Then Secondly, in ſome of them the *Hypoſtaſis* it ſelf, or Conſtitution of the Soul, conſiſting of leſs ſubtle Particles, is not ſo ſuddenly diſſolved; but that its parts ſtick together more ſtrictly among themſelves: nor are they wont to be diſſipated preſently, by any force, as in more hot Animals. Further, as their Souls, as to the greater part by much, ſubſiſt in the Brain and Nervous ſtock, more than in the Blood, it comes to paſs, that however this fire being diminiſhed and almoſt ſuppreſſed, the Animal faculties remain ſtill lively enough: and indeed, far otherways than in hot Living Creatures, whoſe blood being obſtructed about the *Præcordia*, preſently there follows an Ecclipſe of the Animal faculties. Notwithſtanding, Frogs, Eeles, and Serpents, after their Hearts are taken forth, will live for ſome time, and leap about; yea, by reaſon of the animal ſpirits being intangled with a viſcous matter, and not eaſily diſſipable, retain for a little while motion and ſenſe, after their Bodies are cut in pieces, and the ſeveral portions divided, and lay'd apart; as we have ſhew'd before.

In the higheſt form of Animals are thoſe of an hot Blood.

The Third and higheſt Form of Animals, Is that of Creatures of an hot Blood, all which are framed with a two-Belly'd Heart, and Lungs. The Anatomy of theſe being already ſo accurately performed by many, and commonly known, there needs not any deſcription of the Hiſtory and Uſes of the Vital or Animal parts, in theſe kind of Creatures or Brutes.

They are furniſhed with a two-fold belly'd Heart and Lungs.

The chief Species of this Kind, are Fowls and Four-footed Beaſts, and in the ſame Claſs or Rank, we place with the Souls of the later, alſo the Inferior or Corporeal Soul of Man; and that rightly, becauſe there is the ſame Conformity in either of their *Præcordia*, of their Brain, and alſo of their nervous Appendixes; which notwithſtanding differs from that of Fowls or Birds. What kind of difference this is, between thoſe and theſe, as to their Animal parts, we have formerly declared at large; and now we ſhall notifie what difference happens between them, as to their Vital parts.

How the Lungs differ in Birds and four footed Beaſts.

The Lungs of Men and Four-footed Beaſts are every where ſhut in the outmoſt ſuperficies, that the Air entring by the *Trachea* or Wind-Pipe, and by and by entring into its Channels, quickly blows up all the Lobes of the Lungs, and diſtends them, but it goes no further: But in Fowls, the Lungs being full of holes, admit the inbreathed Air into the whole Cavity of the Belly, which by the Muſcles of the *Abdomen* or lower part of the Belly, is exploded thence. The reaſon of this I ſuppoſe to be in ſome part, that there may be a greater plenty for ſinging, and (in ſome) for the longer tuning of the Voyce, or for the more ſtrong or longer breathing forth of the Air. Beſides, (for thir all are not ſinging Birds) it is ſo provided for, in theſe Brutes, that by reaſon of the Trunk of the Body being filled, and as it were extended with Air, they may the more eaſily fly, and are more eaſily held up, by the outward Air, by reaſon of that within.

For what end the Lungs are perforated in Birds.

Indeed Fishes, that they may the more lightly swim in the Waters, have in their Bellyes Bladders blown up with Air. In like manner Fowls, by reason of the Trunk of their Body, being full and as it were blown up with Air, whilst they rely on the open Air, become less heavy, and so fly more lightly and faster. Hence it comes to pass, that men being in danger of drowning, whilst they swim, receive great help by restraining the spirit, and inflating the Breast as much as may be: yea Dead Carcasses being drowned, after the breath or fumes begotten by the inward putrefaction, and shut up within, blow up the fallen Cavities of the Viscera, and extend them more, rise up again, and swim on the surface of the Water.

That the Souls of the more hot Brutes is chiefly Fire.

If we inquire into the Souls of the more hot Brutes, without doubt, it was at first in respect of these, that the Ancients did declare the Soul to be Fire, and the more modern Fire or Flame, these placing it in the Heart, those making it to be inkindled in the Blood: And indeed, since we have granted Souls, as it were fiery, to Bloodless Creatures, and those of a more cold Blood (which also the Lord *Bacon* grants to Plants) it is not for us to deny the same dignity, in Creatures of a more hot Blood: For besides, that the Souls of those, like Flame, require absolutely either sort of Food, *viz.* the Sulphureous and the Nitrous, and cannot be a minute without them, the very hot Blood also, is seen, by mere accension, (for as much as we cannot shew how it can become so hot after any other way) to boyl up, yea and the Lungs, hanging to the two-bellyed Heart, to be the fire-place, chimny, or breathing hole, of the Flame cherished within them. Therefore, as the Soul of the Brute of a more hot Blood, being the perfectest in its Kind, is as it were a Rule or Square, by which others more inferior ought to be measured, and as the same actuating and vivifying the humane body, is subordinate to the Animal, and is the immediate substance of it, (as shall be more fully shown) it remains now, that we inquire into its Nature and Essence, and first of all, that we search into, what parts, powers, and affections she has, which shall be the chief Members of our Psycheology or Discourse of the Soul.

In Man the Corporeal or fiery Soul is subordinate to the Rational.

The parts of the Corporeal Soul.

The Explanation of the Figures.

The First Table,

Contains certain Figures taken out of *Malpigius*, in which the Vital Organs of the Silk-Worm and of other Insects are represented.

The First Figure

Shews the Navil-hole, of which two being planted in the sides of every Section or little Ring (except in the three uppermost) are the Doors or Openings of the Wind-Pipes.

A. A. *The Extremity of the hole, which being black and a little reflected, is united to the Contained Head of the Wind-Pipe.*

B. B. *The Head of the Wind-pipe, filling the Hole, in whose middle is a Cleft.* C. *To which little fibres, like an hairy space, being brought, draw together the gap, or dilate it, that the Air may go out and in at its pleasure.*

The Second Figure

Shews some interior Branchings in the Silk-Worm.

A. A. *A gaping, where the head of the Wind-pipe opens into the oval hole, or Navil.*

B. B. B. C. C. C. *The foldings or ramifications of the Wind-pipe, distributed into the Viscera and other neighbouring parts.*

D. D. *Greater Branches, reaching from the lower and upper head of the* Trachea *or Wind-pipe, towards the other infoldings.*

The Third Figure

Shews the Ramifications of the *Trachea* or Wind-Pipe in a Grashopper.

A. *The head of the Wind-Pipe opening outwardly into the Hole, by and by is branched forth inwardly into various shoots.*

B. The

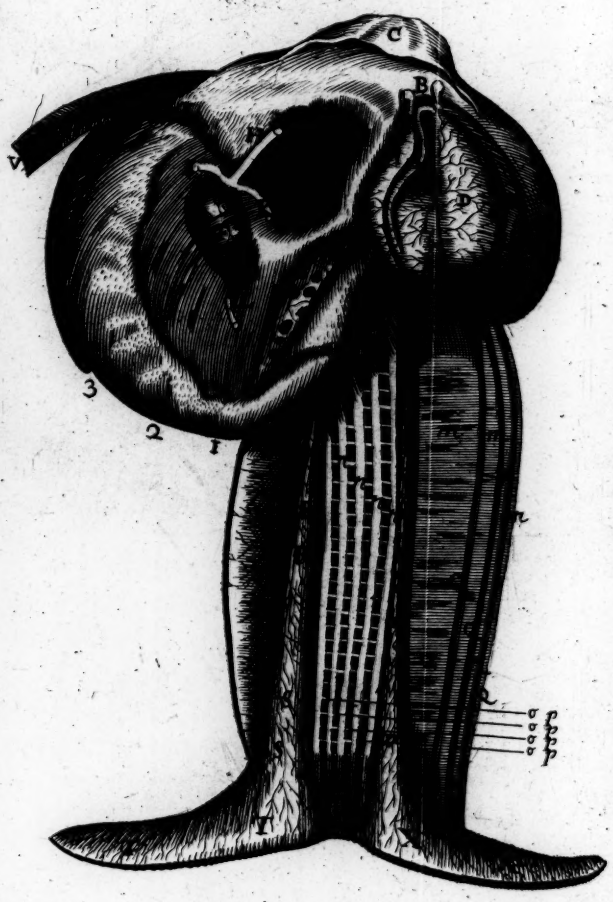
Tabula II.da

Figura. Ia

Figura. IIda



B. *The greater ſhoots of the Wind-pipe, being extended by degrees into the Ovals, as it were into bladders.*
C. C. *The leſſer ſhoots going from thoſe greater.*

The Fourth Figure,

Expreſſes the Heart of the Silk-Worm, which ſeems to be made oblong and unequal, as if into many little oval Hearts.

A. *The upper part of it nigh the Head.*
B. *The lower part nigh the Tail.*
C. C. *The broader part of the Heart.*
D. D. *Its narrow portions.*

The Second Table,

Of which

The Firſt Figure

Shews the Oyſter taken forth and whole from the ſhell, that his parts may be ſeen as they are in their natural ſituation.

A. *The Head of the Oyſter, in the Corners of which,*
B. B. *The Circular Muſcles, going about the whole Body are terminated.*
C. *The gaping or Chink leading between the Muſcles and Gills to the Mouth.*
D. *The ſuperior portion of the Liver, of a browniſh colour, leaning to the Ventricle.*
E. E. *The* Oeſophagus *leading from the Mouth to the Ventricle.*
F. F. F. F. *The* Inteſtine, *deſcending from the Ventricle towards the Corner of the ſtrait muſcle, which being from thence bent inward and rolled about, aſcends above the Liver, being there hidden, ariſes again in* G : *and is terminated in the Arſe.*
H. H. H. *The skin with the glandulous fleſh and fat hiding and lying between the Viſcera.*
I. *The Cavity in which are the* Pericardium, *Heart and Veſſels.*
K. *The ſtrait Muſcle, with the perpendicular fibres, opening the ſhells.*
L. *The other ſtrait Muſcle, the Tendons of which growing to either ſhell ſhut them.*
M. *The thickneſs of the ſame Muſcle, and the altitude of the fibres, are denoted.*
N. N. *The Circular Muſcles including the Gills from the right ſide.*
O. *The ſuperior Circular Muſcle leaning to the Gills, being rolled out of its ſight, that the Gills may be beheld.*
P. *The inferior Circular Muſcle lying under the Gills.*
Q. Q. R. R. *The Parts of the ſame Muſcles placed on the left ſide of the Oyſter.*
S. *The Boſome, where both the Circulary Muſcles, and their right and left parts coming together, Conſtitute the Paſſage, for the admitting the waters to the Gills, and for the ſhutting them forth from thence.*
T. T. T. T. *Four inferior Tufts of Gills which are thinner and broader.*
V. V. V. V. *Their ſuperior Tufts thicker and more contracted.*

The Second Figure

Repreſents the Oyſter open, and unrolled, that its Viſcera and internal parts may be ſeen.

A. A. *Two Gills diſſected from the uppermoſt, and removed out of their places, that the Mouth of the Oyſter may be plainly ſeen.*
B. *The Mouth of the Oyſter.*
C. *The Veil or Covering of the Mouth.*
D. D. *Two other ſuperior Gills in their proper ſite with the Creeping Veſſels.*
E. *The ſuperior browniſh portion of the Liver under which the Ventricle lies hid.*
F. *The Heart made bare from the* Pericardium *with the broad and blackiſh Ear of it.*
G. *The* Aorta, *by and by from the going forth of it from the Heart, divided into three branches.*
H. *The firſt Branch aſcending towards the Head.*
I. *The ſecond towards the ſtrait Muſcles.*

K. *The third Branch tending into the Gills.*
L. *The Trunk of the hollow Vein, entring into the little ear of the Heart.*
M. M. M. M. *The Inferior Gills, with the Circular Muſcles, cut off from the Body of the Oyſter, where they ſtuck to it, and ſpread forth, that their Paſſages and Cavities might be beheld.*
N.N.N.N. *The yoakings or beginnings of the Gills on which lye the ſeveral Veſſels, viz. Veins and Arteries,* O.O.O.O. *and the holes lying between,* P.P.P.P.
Q.Q.Q.Q. *The Extremities or fringes of the ſame Gills.*
R. R. *The Inferior Circular Muſcle of the right ſide, out of its ſite and inverted, that it may be ſeen.*
S. S. *A portion of the ſame by which it ſticks to the bottom of the Oyſter.*
T. T. *A portion of the ſame which Compaſſing the left ſide of the Oyſter ſticks to the portion* V.
W.W. *The upper Circular Muſcle of the right ſide, folded and contracted, that it may not hide the Gills.*
X. X. *A Portion of the ſame which Compaſſing about the left ſide of the Oyſter, ſticks to the Portion* Y.
Z. Z. *The ſuperficies of the Gills, in which the Finns or ſtreaked Paſſages, for the ingreſs and egreſs of the Vital humour and the waters, appear.*
1. *The lower border of the Oyſter, from which the Yoakings and the Circular Muſcles are cut off.*
2. *A Portion of the Inteſtine ending in the Arſe.*
3. *The Arſe.*

The Third Table.

The Firſt Figure

Shews the Lobſter open in the back, that the Brain, Viſcera, Vital, Genital, and other interior Parts may be ſeen.

A. A. *The Brain double, the Hemiſpheres of which being diſtinct, are ſeparated one from the other, alſo a little from the oblong Marrow.*
B. *The Head of the oblong marrow, out of which the optick Nerves* b. b. *and the Mammillarie Proceſſes under them, proceeds.*
C. *The Cerebell.*
D. D. *Two ſhanks of the Oblong Marrow, which paſs into the Spinal, and as it were two greater Nerves, meet now and then in their deſcent, and now and then ſeparate, and then again come together.*
E. *The* Carotis Arterie.
F. F. *A portion of the* Oeſophagus.
G. *The Opening of the Ventricle.*
H. *The upper Oriſice.*
I. *The Bottom and Lower Oriſice near which are three Teeth.*
K. *The Temporal Muſcles out of their place.*
L. L. *Muſcles appendixes of the former.*
M. M. *Bodies ſtuffed with pipes and Glandula's or little Kernels, into which paſſages lye open, from the Ventricle, to whoſe Sides they grow; theſe ſeem to be in the place of the Liver and Meſenterie.*
m. m. m. m. *The ſame Bodies brought lower from either ſide, and ending in the proceſſes,* μ. μ.
n. n. *Spermatick Bodies ariſing on both ſides of the Ventricle, which deſcending under the* Pericardium, *are terminated in the proceſſes,* n. n.
o. o. *Proceſſes out of the Spermatick Bodies, like to the* Epididymis, *from which are two Yards.*
p. p. *Two Yards, in the tops of which, thorow the holes made in the laſt little feet but one, a paſſage lyes open.*
q. *The hole in the little Foot for the going forth of the Yards.*
R. *The* Pericardium, *with the Heart included.*
S. *The little Ear of the Heart into which the* Vena Cava *enters.*
T. T. *The aſcending Trunk of the* Vena Cava.
V. *The* Aorta *going out of the Heart, cleft into three branches.*
W. *The firſt Branch to its Head.*
X. X. *Two other Branches in either Side ſent thence to the Gills.*

Figura I^ma

Tab IIII

Figura I^ma

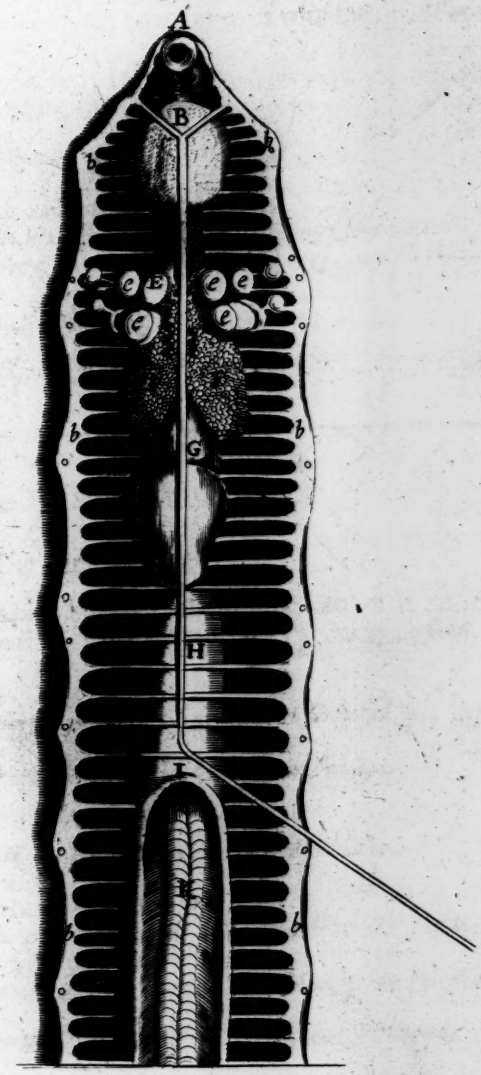

Figura II^da

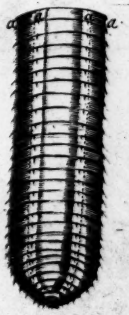

Figura III^tia

Y. Y. *The Tops of ſome of the Gills in view.*
1.2.3.4.5.6. *Some portions of the Muſcles.*
α. α. α. α. *Ligaments from the* Pericardium *to the Muſcles of the Breaſt.*
β. β. β. β. *The Muſcles of the Belly, and Breaſt.*
γ. γ. γ. γ. *Muſcles belonging to the Tail.*
δ. δ. *The Inteſtine from the Ventricle to the Arſe.*
ε. ε. Tubes *or Pipes, within which, the Optick Nerves are brought to the Eyes.*

The Second Figure

Shews the Womb of the Lobſter, and its Neck, and Privy Member, or aperture made thorow the hole in the laſt little Foot but one, together with the little Foot it ſelf, and the affixed Gills.

A. *A portion of the Womb or place of Eggs, full of Eggs.*
B. *The neck of the Womb.*
C. *Its Orifice in the hole of the little Foot.*
D. *The Baſis of the little Foot.*
E. *The little Foot, the ſhaking of which moves the Gills fixed to it.*
F. F. *Two Gills fixed to the baſis of the little Foot, with Finns or ſpongy borders.*
G. *The appendix of the Gills, which like a bladder or membranous bagg, may be blown up and diſtended.*

The Third Figure

Expreſſes a portion of the Gill cut off, that its three Paſſages or Cavities may appear.

The Fourth Table.

The Firſt Figure

Shews an Earth-Worm laid with its belly upwards, the greateſt part of it diſſected and lay'd open, that the Brain, *Præcordia*, *Viſcera*, and other Parts may be ſeen.

A. *The Mouth and Chin of the Worm.*
B. *The Brain, in the ſuperficies of which, an Artery Expanſed or ſtretched out, deſcends to the Heart, and from thence to the Tail.*
b.b.b.b. *Annulary or ringie Muſcles opened and unfolded with their Tendons.*
C. *A portion of the* Oeſophagus.
D. *The Heart.*
E.e.e.e.e. *The upper little white ſhining Globes, both the greater and the leſſer.*
F. F. *Two lower Globes, bigg and full with Eggs.*
G. *The Stomach, of which there are three Bellies,* 1. 2. 3.
H. *The Inteſtine, deſcending from the Ventricle, which being bound by the Tendons of the ringie Muſcles, appears like the Gut* Colon *in perfect Animals.*
I. *A portion of the ſame Inteſtine opened, that the Body included in it, or the Inteſtine in the Inteſtine may be ſeen.*
K. *That interior Body, which ſeems to be in the place of the Liver, and Meſenterie.*

The Second Figure

Expreſſes a portion of the ſame Earth-Worm, with the Tail cut off, that the rowes of little Feet, which are 4, to wit, *α. α. α. α.* may be ſeen.

The Third Figure

Shews the whole Earth-Worm prone, or with its back uppermoſt, that the ringie Muſcles, and the Wind-Pipes in them, may be ſeen.

CHAP.

CHAP. IV.

Of the Parts or Members of the Soul of the Brutes.

A double Subject of the brutal Soul.

THE Corporeal Soul in more perfect Brutes, and common to Man, is extended to the whole organical Body, and vivifies, actuates and irradiates both its ſeveral parts and humours, ſo it ſeems to ſubſiſt in both of them eminently, and to have as it were its imperial ſeats; But the immediate ſubject of the Soul, are the Vital Liquor or the Blood, Circulated by a perpetual Circulation in the Heart, Arteries, and Veins; and the Animal Liquor or Nervous Juyce, flowing gently within the Brain and its Appendixes: The Soul inhabits and graces with its preſence both theſe Provinces; but as it cannot be wholly together at once in both, it actuates them both, as it were divided, and by its parts: For as one part living within its Blood, is of a certain fiery nature (as we have ſhown) being inkindled like flame, and the other being diffuſed thorow the animal Liquor, ſeems as it were Light, or the rayes of Light, flowing from that Flame; which from thence being Excerpted, and manifold ways reflected and refracted, by the Brain, and Nerves, as it were by Dioptrick Glaſſes, are diverſly figured, for the Exerciſes of the Animal Faculties.

The blood or vital Liquor.

The Nervous juyce or animal Liquor.

From hence two parts of the Soul.

Flamy and light.

There are therefore Corporeal Souls, according to its two chief functions in the Organical Body, *viz.* the Vital and Animal; two diſtinct parts, to wit, flamie and lucid, for what belongs to the ſaid natural function, that indeed is involuntary of the Animal, and is performed by the help of the Animal ſpirits.

But beſides theſe two members of the Soul, fitted to the individual Body, a Certain other portion of it, taken from both, and as it were the Epitomy of the whole Soul, is placed apart, for the Conſervation of its Species: This as it were an Appendix of the vital flame, growing up in the Blood, is for the moſt part Lucid or Light, and Conſiſts of Animal Spirits: to wit, which being Collected into a certain band, and having got an appropriate humour, *viz.* the genital, are hidden within the ſpermatick Bodies; to the end indeed, that, when opportunity ſhall ſerve, that Band of ſpirits, as it were a little Brand not yet inkindled, may be able from thence to be drawn into fit fire, and to be inkindled into another Vital Flame, the formatrix of a new animated Body.

To which may be added another the Epiphyſis or dependence of the whole Soul, viz. the Genital part.

Concerning theſe three Members of the Corporeal Soul, two, to wit, the Vital and Animal, fiery by Act, and the other, *viz.* the Genital, lay'd up for a future firing, it ſhould have been particularly and fully here treated on: But ſince we have already ſufficiently diſcourſed of the two former, I ſhall only add briefly, by way of Suppliment, the Summ of what I have ſaid before, and then we ſhall alſo briefly diſcourſe of the begetting part of this Soul.

The parts or Members of the Soul.

First, It appears, that the part of the Corporeal Soul rooted in the Blood, is truly flamy, as to which we need only to refer you, to what we have wrote lately in a particular Tract of the Accenſion of the Blood: For there having ſhown, the heat of the Blood to be neceſſarily required, to wit, whereby a greater plenty of ſpirits may be inſtilled into the Brain, from its frame being very much looſned; by and by we prove, from thoſe three ways, by which all Liquors whatſoever are only made hot, none can agree with the blood, beſides accenſion or inkindling: For neither by heat put to it, nor by reaſon of Salts and Sulphurs, which are Corroſives of a divers Kind being put together, can the blood be made to boyl; wherefore it follows, that it is inkindled like the ſpirit of Wine, and ſo as it were flames forth and boyls up. Further we ſhewed, that it is truly inkindled in hot living Creatures, becauſe the proper Paſſions of Fire and Flame, are found only beſides in the Life of the Blood; for in like manner both to this, and to them, there is need conſtantly of an Internal Sulphureous Food, together with the External nitrous; yea, and either Flame, alike, to wit, the Kitchin and Vital, whil'ſt they burn deſire Eventilation. To theſe may be added, that the Life and Flame of the Blood, as to their Various ways of production and extinction, there particularly deſcribed and rehearſed, are wholly after the ſame manner. Laſtly, the analogie or agreement of either Flame, being ſufficiently unfolded, we have declared, by what beginnings, the Vital Flame ariſes, by what degrees it increaſes, and, after its hight, is diminiſhed; Further, we have ſhew'n reaſons, wherefore this is not viſible and deſtructive as the common Flame, but as it is Subordinate to the Corporeal Soul, as to a Superiour Form, it admitting a proper Species, and ſerving to the uſes of Nature, deſtinated by the Creator, ſilently burns with a gentle and friendly heat, like a Fire ſhut up in *Balneo Mariæ*, apart by it ſelf; and as it ſo deſtroys not the Blood, but inkindling the Liquor

The Flamy part of the Soul in the Blood.

Which we have ſhewed to be truly inkindled.

even

even so its Superficies, wholly dissolves the frame of the whole mixture; it follows thence, that some particles being burnt, others of a various Kind being manumitted or let go, they are Variously imployed in the offices of the others; but of these, those which are chiefly Subtil, as it were Beams of Light sent from a Flame, are, as it were distilled into the Brain and Cerebel. These most subtil particles are called the Animal Spirits, and first of all entring the Cortical Substances of those parts, and from thence flowing into the *Medullia* or middle parts of either of them, and into the Oblong and Spinal Marrow, and further into all the Nerves and Nervous Fibres, dispensed thorow the whole Body, Constitute the other and more noble part of the Corporeal Soul, commonly called the Sensitive, by us the Lucid or Etherial; into whose Nature, as also into the ways of its Subsisting, Acting, and Suffering, we shall now in the next place inquire.

The sensitive part of the Soul divisible and extensed.

Secondly, The sensitive part of the Soul, even as the Vital, is extensive and divisible; whose *Hypostasis* when as the Animal Spirits, as to the Integral parts, do Constitute, a great and difficult question arises, concerning them; of what sort of substance they are, and from whence they are indued with so notable an Energy or Power? I shall say nothing to those, who wholly deny these Spirits, for that the existencie of which, is almost palpable, and may be proved demonstratively by the effects; nor am I much solicitous of those, who arguing Contend, that the Senses and Faculties of living Creatures, however perceptive, cannot be but from an Immaterial and Immortal Substance, and therefore without any necessity, multiply almost to Infinity, and I know not for what end, not only Essences, but also immortal Souls of Brutes, yea, of Fleas, Flys, and of other more vile Insects. Against these Opinions there needs no other Argument, than that any one may consider truly in every Brute or Man, the Organs of the Animal Faculties, than which certainly nothing in the whole nature of things, can be made more Mechanically, and with a more neat Artifice. The Brain and Cerebel, the two Roots of the Lucid part of the Soul, or rather the Fountains of the Primary Spirits, are placed in the top it self of the Body, into which, when the Animal Spirits are distilled, from the Blood, placed above and round about, as it were by a descent; they from thence flow forth through the Medullary and nervous Appendixes, as it were by Bills or Pelicans placed here and there, into all the inferiour parts. Either head consists of a double Substance, *viz.* a Cortical or Barkie, which for the most part serves for the reception of the Spirits; and a Medullary or Marrowy, which serves for their dispensation and exercise.

The Animal Spirits constitute its Hypostasis.

The Brain and Cerebel, two roots of the sensitive Soul.

Further, as the Animal Spirits, for divers uses of the Animal Faculties, ought to obtain Tendencies or Stretchings forth of a divers sort, within their distinct and peculiar passages, either Medullary part being wonderfully Divaricated, is cut every where into Various tracts of Labyrinths, as it were so many Conclaves and Chambers; all which Medullary tracts, the Cortical part every where lies between and fortifies; From these, as it were Primary Palaces of the Soul, the Oblong and Spinal Marrow, like spacious Courts are stretched forth, which also are furnished, by reason of the Medullary substances variously lying between, with many Porticoes and Walks, planted here and there, for the necessary works of the Animal Function: From these Marrows, the Nerves arising, are carried to the several parts of the whole Body, as it were so many distinct paths; then from these many other small Shoots or nervous Fibres, being on every side sent forth, as it were so many smaller or lesser Paths, are almost innumerable; at the ends of which, others secondary Fibres, Membranaceous and Musculous, are disposed, though thick Series, as it were so many martial Fields, in every one of which is placed a Meniple or Band of Spirits. In this most ample and highly intricate Labyrinth of Cloysters, and Animal passages, the Medullar or Nervous Processes, how small soever, being most thickly set, variously implicating one another, and ordinarily cutting cross one another, yet all of them distinct, and designed to certain offices, allways agree mutually between themselves, and intimately conspire together; So that every Impulse or Instinct, is carried from one end to another presently, yea, from every part to all the rest, sooner than in the twink of an eye. Further, from the effects it is demonstrated, that within these several tracts, some subtil particles do flow, and cause Animality or Life in all; which tho they be most thin, invisible, and nimble, we rightly call the Animal Spirits, and the Constitutive parts of the sensitive Soul.

The substance of them twofold viz. Cortical and Medullary.

To them are belonging the oblong Marrow, the spinal Marrow, Nerves, nervous Fibres.

Both Membranaceous and Muscular.

Almost quick Communication between all these Parts.

Altho it appears plain, that such like Spirits are the Authors of the Animal Function, and do constitute the *Hypostasis* of the Soul it self; yet what they are according to their proper essence, seems hard to be unfolded; because we can hardly meet with any thing in Nature, to which they may be compared in all things.

What the Animal Spirits are.

The comparing of these, with the Spirits of Wine, Turpentine, and Harts-Horn, and such like, does not quadrate or agree. For besides, that those Chymical Liquors, neither represent the Images of their Objects, nor are indued with any Elastic Virtue, as the

They are not well compared to Spirits of Wine, Harts-horn, Turpentine, &c.

the Animal Spirits; thoſe alſo are leſs Subtle than theſe, and leſs Volatil, for as much as they may be powred forth out of one Veſſel into another, or may be diſtilled; but the Animal Spirits preſently vaniſhing, after life is extinct, leave no Foot-ſteps of themſelves. Wherefore, it is better, according to our *Hypotheſis*, that we liken theſe Spirits ſent from the Flame of the Blood, to the Rays of Light, at leaſt to them interwoven with the Element and the Air. For as Light figures the Impreſſions of all viſible things, and the Air of all audible things; So the Animal Spirits, receive the impreſſed Images of thoſe, and alſo of Odors, and tangible qualities, and ſtay them at the firſt Senſory. But the Air, or Aerial particles, whilſt free and unmixed, create nothing of force or tumult, yet they being more ſtrictly preſſed together, ſhut up in Clouds or Inſtruments, or imbued with Sulphureous, and other Elaſtick Bodies, being become preſently raging, they often break forth into Meteors, *viz.* Winds, Hurricanes, and horrid Thunder. After the ſame manner, the Animal Spirits, whilſt pure, are carried in the open ſpaces of the Head, and its Appendixes remain quiet enough; but they being ſhut up within the Muſcles, and there being mixed with Sulphureous Particles from the Blood, and ſometimes in other places, with an heterogeneous matter, become very impetuous, to wit, Elaſtick, or Spaſmodick or Cauſing Cramps, as we have declared formerly at large.

Better to the Rays of Light interwoven with the Air, or the Element.

Therefore the Animal Spirits, according to this *Analogy*, (to wit, which thing of them happens chiefly and almoſt only with other things) we ſay are moſt ſubtil Bodies, and highly active, inſtilled from the inkindled Blood into the Brain, and its Appendix, which partly of their own nature, for as much as they are lucid and aerial, and partly from the agreeable furniture of the Organs, for that they are ſhut up within Paſſages, as it were Pipes and other Machines, abound with both an objective Virtue, by which many rays of Light promptly meet together in the Images of all ſenſible things, and effect the ſenſion of every Kind, and alſo, an Active, by which the loco-motive powers, and alſo the acts of the Spaſmodic Affections, are performed, beyond the forces or Inſtincts of wind, or any blaſt ſhut up in machines.

The Animal Spirits abound both in an Objective and an Active Virtue.

In Mechanical things, Fire, Air, and Light, are chiefly Energetical, which humane Induſtry is always wont to uſe, for the greatly ſtupendious, and no leſs neceſſary works. This the Furnaces of Smiths, Chymiſts, and Glaſs-men, and of other boylers of ſeveral Kinds, Dioptrick Glaſſes, Muſical, Warlike, Mathematical Inſtruments, with many other Machines, never enough to be admired, do teſtifie. In like manner we may believe, that the Great Workman, to wit, the Chief Creator, from the Beginning, did make the greatly active, and alſo the moſt ſubtil Souls of Living Creatures, out of their Particles, as the moſt active; to which he gave alſo a greater, and as it were a ſupernatural Virtue and Efficacy, from the Excellent ſtructure of the Organs, moſt Exquiſitly laboured, beyond the Workmanſhip and artificialneſs of any other Machine.

As Fire and Light in Mechanical things ſo in Animals, they are chiefly Energetical.

We have deſcribed theſe Parts formerly in Plates, ſo that we need not here repeat their Anatomy, but only add a few things that were omitted. In the Animal Government, altho the Spirits are diſpoſed, as it were an Army ſpread abroad thorow the whole Field, yet we ſay, that they obtain Orders and Offices, one thing in this part, and ſomething different in that. In every one of theſe we have noted, as it were a double Aſpect or Geſture, in the Provinces in the Medullary ſhanks of the Head, in the Nerves and alſo nervous Fibres, to wit, one of Begetting and Diſpenſing, and another of Exerciſe and Government.

A two-fold Action of the ſpirits in the Brain and its Appendix, 1. Of begetting and diſpenſation, 2. Of Exerciſe and Government.

As to the firſt, we have ſhown, that the animal ſpirits being procreated wholly in the Cortical or Barky ſubſtances of the Brain and Cerebel, do deſcend by and by into the middle or marrowy parts, and there are kept in great plenty, for the buſineſſes of the Superiour Soul; in the mean time, a ſufficient ſtock of theſe, gently flowing from this higheſt Province into the oblong and Spinal Marrow, and thence into the Nerves & Nervous Shoots, actuates all theſe paſſages, and blows them up into a certain Tenſity. Laſtly, a ſufficient plenty of Spirits, diſtilling forth from the ends of the Nerves, enter into the nervous Fibres, planted in the Muſcles, Membranes, and Viſcera, and ſo conſtitute them, the proper and immediate Organs of the Sence and Motion. After this manner, the Region of the whole Senſitive Soul being viewed, if we would deſcribe its *Idea* or Image, we muſt altogether repreſent the ſame Figure and Dimenſion, and the whole Head with its Syſtem and Appendix; ſo that as we may behold all theſe parts, ſhaddowed in the ſame Image, we ought to frame at once, the *Hypoſtaſis* of this Soul, adequate and Co-extended to them.

The reaſon and manner of the former.

As to the ſeveral ſorts of Offices and Exerciſes of the Spirits, ſo planted in diſtinct Provinces, Firſt; we deſervedly attribute to them a two-fold Aſpect, to wit, inward for Senſe, and outward for Motion: But more particularly, we may conceive the middle or Marrow part of the Brain, as it were the inferiour Chamber of the Soul, glaſed with

The diſtinct Offices of the ſpirits in various Provinces.

with dioptric Looking-Glaſſes; in the Penetralia or inmoſt parts of which, the Images or Pictures of all ſenſible things, being ſent or intromitted by the Paſſages of the Nerves, as it were by Pipes or ſtrait holes, paſs firſt of all thorow the ſtreaked Bodyes, as it were an objective Glaſs, and then they are repreſented upon the Callous Body, as it were upon a white Wall; and ſo induce a Perception, and a certain Imagination of the thing felt: Which Images or Pictures there expreſſed, as often as they import nothing beſides the mere Knowledg of the Object, then by and by further progreſſing, as it were by another waving, from the Callous Body towards the Cortix or ſhell of the Brain, and entring into its folds, the phantaſie vaniſhing, they Conſtitute the memory or remembrance of a Thing: But if the ſenſible ſpecies being impreſſed on the Imagination, promiſes any thing of Good or Evil, preſently the ſpirits being Excited, reſpect or look back upon the Object, by whoſe appulſe they were moved, and for the ſake of embracing or removing it away, by other ſpirits flowing within the Paſſages of the Nerves, and ſucceſſively by others implanted in the Members and moving Parts, they ſwiftly give their Commands of performing the reſpective motions. So the Senſe brings in the Imagination; this the Memory or the Appetite, or both at once, and at length the appetite ſtirs up local motions, performing the proſecution or driving away of the appearing Good or Evil. For the ſeveral Kinds of theſe ſort of Animal Functions, yea for the Various Acts of either Kind to be performed, the Animal Spirits, who are the immediate Inſtruments of them all, obtain peculiar and diſtinct tracts or paths; within which, if there be any let or bar to hinder, preſently ſome function is hindred, or ſome member of the ſenſitive Soul, being as it were cut off, becomes impotent.

The perception of Senſions in the ſtreaked Bodies.

The Imagination, Phantaſie, and Appetite, in the Callous Body.

The memory and remembrance of a thing or reminiſcency within the folds of the Brain.

The ſeries and order of their powers.

Who can ſufficiently admire the innumerable ſeries of nervous Fibres, diſtributed in a moſt wonderful order thorow the ſeveral parts of the whole Body; in which the animal ſpirits, like Soldiers ſent abroad, perpetually running up and down, on this ſide and on that, perform the offices of Senſe and Motion. Further, thoſe who dwell within the Head it ſelf, the ſuperior Legion of the ſenſitive Soul, altho more freely ranging, yet lye not diſorderly or looſely, but its numerous Company, being limited with certain Bounds and Cloyſters, as it were within the narrow ſpace of One Chamber, perform infinite Variety of Actions and Paſſions.

The tracts or paths of the Spirits, are diſtinct within the head it ſelf, even as within its nervous Appendix.

Concerning theſe, diſcourſing formerly more fully in our deſcription of the Brain and Nerves, we did diſtinguiſh the Seats of all the Faculties, yea we did ſhew the Commands of the Animal Function voluntary and involuntary, to be divers in themſelves, alſo to belong to divers Governments of the Brain and Cerebel, with their reſpective appendixes of the Nerves. Further, we ſhewed that thoſe Spirits, the Authors of either function, not only within the narrow Channels of the Nerves, but alſo in the large meeting places or *Emporiums* of the Head, have peculiar paths, to wit, the medullary tracts, as it were intrinſick Nerves, moſt curiouſly ſtretch'd forth here and there. But indeed, becauſe it is objected, that I have not deſcribed all, and perhaps not exactly enough; therefore, that thoſe medullary Paſſages may be the better beheld, we have lately inſtituted another more accurate anatomy of the Brain; to wit, by gently ſcraping with the point of a Pen-knife its parts, we removed every where the ſofter and browniſh ſubſtance, a-Kin to the *Cortex* of the Brain, the whiter and more hard being left; by which means, in ſeveral places of the Brain and the Oblong Marrow, many Medullary Chords or Strings, as it were diſtinct Nerves, wonderfully Communicating among themſelves, and with other white or medullary Bodies, were brought into ſight. For as much as this Anatomical Adminiſtration, render'd the more ſecret paſſages of the Spirits, and the motions belonging to the Arcana's of the animal Government, very Conſpicuous; we ſhall here ſhew a new Figure or two of the Brain rolled forth, and the fleſh when taken off in the chief places; in which are plainly beheld, both the Common Paſſages, and the Private paths of the Spirits, and which carry them backward and forward, immediately thorow the beaten way of the medullary tail, and which lead thorow the by-paths of the Prominences, into the ſtreaked Bodies.

Every where the various Medullary tracts, are diſtinct from the Cortical.

A more exact Anatomy of the Brain, through its Cortication or Shelly part.

The Common paſſages, and the private pathes of the Spirits.

Therefore, in the Brain taken out, and rolled abroad according to our Method, let there be a diſſection ſo made, between the Orbicular Prominences, to wit, between the *Teſtes* or Teſticles, *Nates* or Buttocks, that when they being whole, and divided in the middle of the Pinal *Glandula*, the parts are layed by themſelves, the ſtreaked Cavity of either may be lay'd open. (As in the 6*th* Table, Fig. 1. A. b, E. A. b. c. c. D.) Then it it will eaſily appear, that the ſaid Prominencies, called the *Teſtes*, are marrowy *Epiphyſes* (or additions) of the oblong marrow, which ſticking to the tails of the Cerebel, from thence look towards the Brain, and a Commerce is ſeen to be maintained between this and that.

To wit, which thorow the orbicular prominences, are the Teſtes *and* Nates.

This laſt *Ephiphyſis*, paſſes from the parts of the Brain, into the next *natiform* (or of the form of a Buttock) *B.* which is an adjunct, or ſome Augmentation of that: To this

Medullar *a.a.* in a Sheep, Ox, and many four-footed Beasts, grows a Cortical substance *B.B.* But otherways in a Man, Dog, Fox, and other more sagacious Creatures, it is marrowy thorow the whole; the reason of the difference, I have shewed in another place.

The description and use of them.

This medullary *Epiphysis* reaching above the *Testes* and *Nates*, and going under the Pineal Kernel, tends towards the Chambers of the Optick Nerves; approaching which (*F.*) by and by it is cleft into two Branches, as it were Nervous, one of which *G*, is carryed to the Cone of the streaked Body, and the other *H.* towards its Basis, and in its oblique passage, sends a shoot into the midst of the Border of the streaked Body: this Branch going to the basis of the streaked Body, behind the root of the *Fornix*, is inserted into an Angle of the streaked Body.

From these; Medullary tracts into the streaked Bodies.

And wherefore.

As to the Use of these Parts, we have proposed our Conjectures in our Tract of the Brain; and truly nothing seems more probable, than that by this side-path of the Prominences, and by the Passage of the Medullary Passages, there are Commerces held between the Brain and the Cerebel; for as often as it happens, that Impressions or Instincts meerly natural, follow spontaneous Affections and Motions, or are joyned to them, all that, within those private Tracts, is occupied. See our *Anat. of the Brain*, p. 176. Further, whereby every such Impression from the Viscera or Precordia, by the mediation of the Cerebel, are carried from them in the same way forward and backward, into the streaked Bodies, and on the contrary every force and perturbation; The Medullary-passage, which is for their commerce, enters in three places, *viz.* In the middle, and at either end, into the streaked Bodyes.

To the orbicular Prominences, succeed the Chambers of the Optick Nerves.

The description of them.

The use.

To the Prominences which are called *Nates* and *Testes* succeed the Chambers of the Optick Nerves *E. E.* as also above the Medullary Trunk, certain *Epiphyses* or Additions, serve for a private office *viz.* only for the visive Function. For as the sight is a most noble faculty, and as the Organ of the eye is highly curious, so it obtains a very spacious Furniture or Porch, and also a very strait, to the common Sensory, *viz.* the streaked Bodies: Because the Optive Nerves coming together, under the Trunk of the oblony Marrow, and being by and by disjoyned, they climb up his sides, where going under the appropriate Protuberances, they go into a numerous company of hairy threads, which are every where interwoven with the cortical Substance. *Fig.* 2. *Tab.* 6. These Medullary or Nervous structu res or bindings, which without doubt the visible Species pass thorow, are all parallels, which being stretched forth Strait, are brought to the streaked Bodies every where, through their whole Compass. *Fig.* 2. Hence it is probable, the causes of the Sandy drops or Spots, yea, and of the sight otherways depraved or lost, do lie hid, not only in the Eye and Optick Nerve, but sometimes in these parts; for as much as those Filaments or Nervous threads, being obstructed or bound together, the visible Species are not able to beam themselves to the streaked Bodies. I knew one, being affected, by his Imagination and Memory being grievously hurt, that those diseases vanishing, fell into blindness: The reason of which accident seems to be, that the morbifick matter occupying at first the superior frame of the Brain, being slid thence lower by the Cortix, at length enter'd into the Optick Chambers.

The Mamillary Processes, are carried by a private passage, to the streaked Bodies.

There remains yet a private passage of another sence, to wit, of the smelling, to the common Sensory, *viz.* the streaked Bodies; The mamillary Processes being entered into the Prominences of the Inferiour Brain, go under its Basis till they come to the border of the streaked Body on both sides, then being a little bent inwards: they proceed by an oblique passage towards its Basis, where they are inserted. *Fig.* 1 *Tab.* 6.

The common passage of the Spirits, to the streaked Bodies, is made by the shanks of the oblong Marrow.

As to the Impressions of the other Senses, and to the force and Instinct of every Spontaneous motion, carried up and down, there is a necessity, that all these Kinds of Commerces, between the streaked Bodies and the Nervous Appendix, should be made by the Shanks of the longish Marrow: The tops of these being large and broad, Stick to the hindermost borders of those, so that from these into those, and so on the Contrary, a going and returning is easily performed. Further, that the many and divers motive and Sensible Forces and Impressions together, may be carried without confusion, by this beaten and common way, the whole frame of the Medullary Shanks, appears thorow the whole to be made with Nerves or Medullary strings compacted together; as if they were so many distinct paths, in this common passage of the Animal Spirits, for the inculcating the Various acts of the Senses and of Motions. The Sixth Table represents these parts to the Life.

An accurate description of the striated or streaked Bodies.

The chamfer'd or streaked Bodyes, consist of a most exquisite and greatly to be admired Fabrick: The figure of either, coming something near the Cone, appears like a Cone reflected and bent inward; the outmost and superior Superficies is round and Barkie, thorow which creep Blood-carrying Vessels, and a portion of the *Chorioedal* Infolding hides it; The middle and Inferior frame of them consists of a Medullary Substance, with a Cortical mixed between. Tab. 8*th* l. m. The sides or either border of these, both the

Superior and Inferior, are for the moſt part Marrowy, and look white like the greater Nerves; n. K. Between theſe ſtreaks or Marrowy ſtrings, thick ſet, and of a divers magnitude, being ſtretched forth like the greater Nerves, Knit together, both the Borders: The anterior Border n. n. is every where knit to the Callous Body; ſo that whatſoever is to be carried forward and backward by either, *viz.* from one to another, we ſuſpect they have for it this paſſage between thoſe Medullary paſſages. The hindermoſt Border of the ſtreaked Body, in its upper part, receives the Medullary Proceſſes ſent thither from the round Prominences, and alſo the Optick Chambers, into its Boſome: In the middle and loweſt part, either Border is fixed to the Shanks of the oblong Marrow; and nigh to the Baſis of the Fornix, the inferior Border of one ſtreaked Body, is continued into the other Border; to the end, that theſe Bodies alſo might have between themſelves a mutual Commerce, which is alſo obſerved almoſt of all the reſt of the Parts of the Head, that they are double, and do communicate among themſelves, by certain paſſages; ſo that if one part ſhould be faulty, its defect might be made up by the other being whole.

The uſe or Offices of the ſtreaked Bodies.

As to the Offices and Uſes of the ſtreaked Bodies, though we can diſcern nothing with our eyes, or handle with our hands, of theſe things that are done within the ſecret Conclave or Cloſſet of the Brain; yet, by the effects, and by comparing rationally the Faculties, and Acts, with the Workmanſhip of the Machine, we may at leaſt conjecture, what ſort of works of the Animal Function, are performed in theſe or thoſe, or within ſome other parts of the Head; eſpecially becauſe it plainly appears, that the Offices of the Interior Motions, and Senſes, as well as the Exterior, are acted by the help of the Animal Spirits, ordained within certain and diſtinct Paths, or as it were ſmall little Pipes.

They receive the Impreſſions of ſenſible things: and convey the Inſtincts of Motions.

As therefore it appears from what we have ſaid, that the chamfered or ſtreaked Bodies are ſo placed, between the Brain and Cerebel, and the whole nervous Appendix, that nothing can be carried from theſe into that, or on the contrary be brought back hither, but it muſt paſs thorow theſe Bodies; and as peculiar paſſages lead into theſe moſt ample Diverſories, from the ſeveral Organs of Motions, Senſe, and the other Functions; and further, as Paſſages lie open from theſe into the Callous Body, and into all the Marrowy Tracts of the Brain, nothing ſeems more probable, than that theſe parts are that common Senſory, that receives and diſtinguiſhes the Species, and all Impreſſions, transferrs them, being ordained into fit Series, to the Callous Body, and repreſents them to the Imagination there preſiding; that alſo tranſmitts the Force and Inſtincts of all ſpontaneous motions, begun in the Brain, to the Nervous Appendix, to be performed by the motive Organs. By reaſon of theſe manifold and divers offices, ſo many Marrowy ſtreakes or internal Nerves are produced within the ſtreaked Bodies, for the Various Tendences and Beamings forth of the Animal Spirits, it may very well be concluded that the Senſitive Soul, as to all its Powers and Exerciſes of them, is truly within the Head, as well as in the nervous Syſtem, meerly Organical, and ſo extended, and after a manner Corporeal.

The Explanation of the Figures.

The Fifth Table,

Shews the Figure of the Brain of a Sheep roled forth, and deraſed, and as it were made bare of the Fleſh, in many places, that the Marrowy Tracts may be ſeen.

A. A. *The Medullary Protuberances called Teſtes, which being certain* Epiphyſes *or extreſcences of the oblong Marrow, and joyned to the Trunks of the Cerebel look thence towards the Brain.*

B. B. *The Natiform Protuberances, the Subſtance of which in a Sheep, a Goat, and many others, is partly Cortical,* a. a. *partly Marrowy,* b. b. *in a Man, Dog, Fox, and others it is wholly Marrowy.*

C. *The Cavity or Ventricle, lying under the Prominences, which is lay'd open, theſe being diſſected and opened.*

D. D. *Two Marrowy Chords or ſtrings of the Medullary Trunk, going ſtrait to the ſtreaked Bodies.*

E. E. *The Chambers of the Optick Nerves.*

c. c. *The parts of the pineal Kirnel, cut thorow the midſt, and laid apart.*

F.F. *The Medullar or nervous passage proceeding from the Prominences, which presently becoming forked, sends forth one branch* G. *to the Cone of the streaked Body, and the other* H. *to its Basis.*

I. *A shoot from the medullary Branch, going towards the Basis of the streaked Body, reaching into the midst of its Border.*

K. *The latter border of the streaked Body, receiving the nervous passages, and under the root of the* Fornix, *united to its like Border of the other side.*

L. *The whole streaked Body with its Vessels creeping thorow its Cortex or shell.*

M. *The other streaked Body, with the shell scraped off, that the Nerves or marrowy Tracts may appear.*

N.N. *The foremost border of both the streaked Bodyes, Conjoyned to the Callous Body.*

O. *The Basis of the* Fornix.

P. *The Trunk of the* Fornix *Cut off, and with the Brain rolled out, removed at a distance.*

Q.Q. *The two roots of the* Fornix.

R.R. *The interior superficies of the Callous Body, noted with transverse medullary streaks.*

S. *A medullary hedg or mound, dividing the streaks of one side, from those of the other.*

T.T. *Portions of the Brain Cut off and rolled forth, which (as also its whole Frame) appears with a marrowy, and a Cortical substance intermixt.*

V.V. *Portions of the divided* Cerebel *lay'd apart.*

W. *The Portion of the Oblong Marrow situated beyond the* Cerebel.

The Sixth Table,

Shews the Basis of a Sheeps Head, in certain parts of which Derased, and in others Exposed naked, the Streaks or Medullary Tracts, as so many Nerves, appear.

A.A. *The Mamillary Processes carried to the Basis of either Streaked Body, and inserted into them.*

B.B. *Some remaining portions of the Brain cut off from it greater bulk.*

C.C. *The streaked Bodies derased, and as it were made bare of flesh, that the Medullary streakes may appear also in its lower parts.*

D.D. *The Chambers of the Optick Nerves, in which the strait and thick-set Medullary streakes, are reached forth, towards the streaked Bodies.*

E. *A Tract leading to the Tunnel of the Brain.*

F. *A Kernel placed behind the Tunnel, which is twofold in man.*

G.G. *The Trunks of the Optick Nerves divided, and removed, from their joyning together before the Tunnel.*

H,H. f.f. *The Shanks of the oblong Marrow lying under the Orbicular Prominences, in which strait and most thick streakes are also stretched forth towards the chamfer'd Bodies.*

I.I.I. *Transverse Medullary Tracts distinguishing the regions of the oblong Marrow.*

K.K. *Ringy Processes compassing about the oblong Marrow, nigh the Cerebel.*

L. *The extremity of the oblong Marrow going into the Spinal.*

M. *The Top of the Spinal Marrow.*

The Seventh Table,

Shews the orbicular Prominences, and the Optick Chambers Eraſed, and as it were made bare of Fleſh that their inward Frames may be beheld.

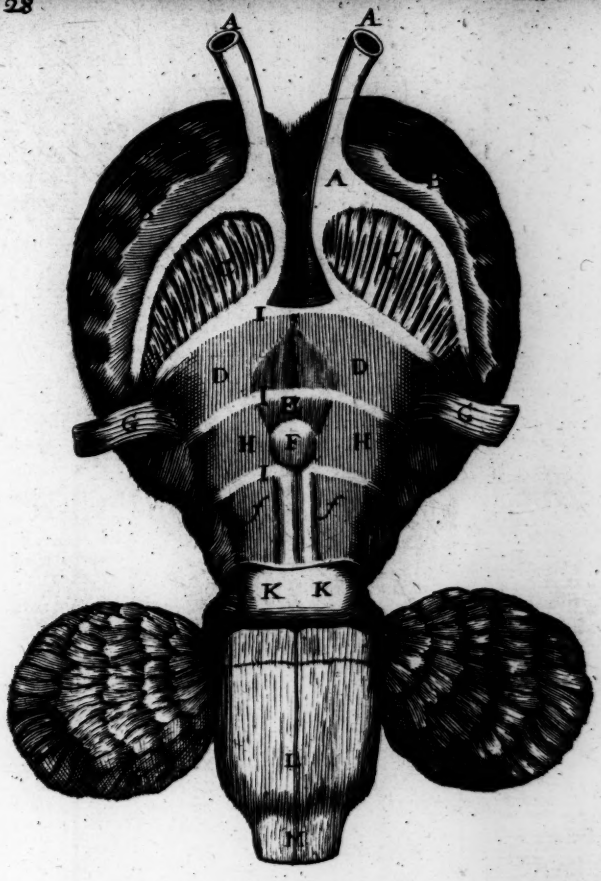
A.A. *The Testes, which thorow the whole being Medullar, are marked with strait Fibres.*

B. *The Nates, one of them being Derased, in which the strait and thickest Medullary streakes, are stretched forth towards the Brain.*

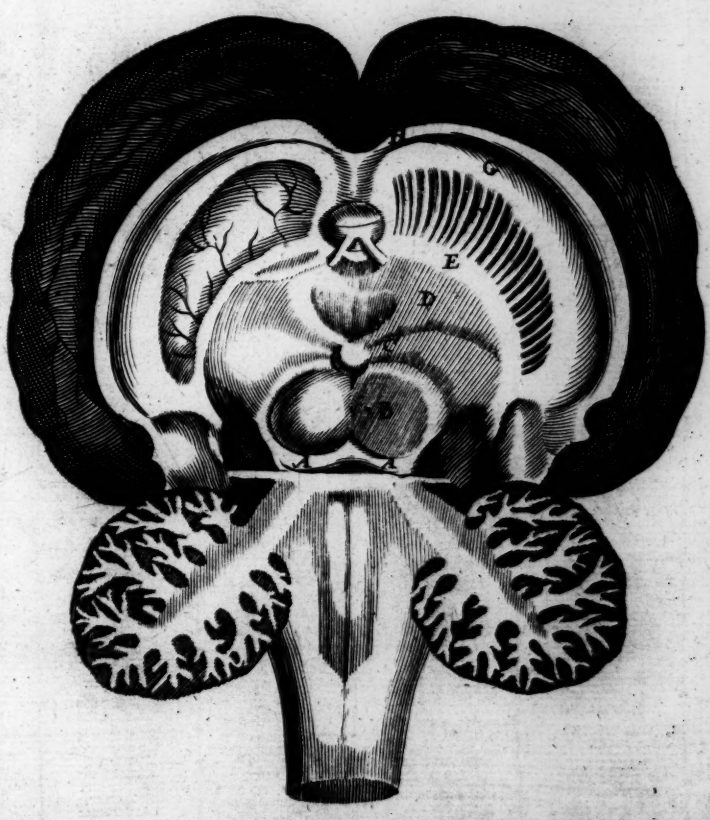
C. *The Medullary Hedg or Mound, dividing the Natiform Prominences from the Optick Chambers, and from which, one Medullary Process is carried into the Basis of the streaked Body, and the other into its Cone.*

D. *One Optick Chamber scraped, that its straight and most thick-set streakes, stretched forth towards the streaked Body, may appear.*

Tabu. VI.



Tabu. VII.



E. *The hinder Border of the ſtreaked Body, receiving the Optick, Medullar ſtreakes, and other Medullary Proceſſes.*

F. *The ſtreaked Body decreaſed, whoſe little Medullary Nerves and Paſſages, are explained in the* 5th. *Table.*

G. *The foremoſt border of the ſtreaked Body.*

H. *The Boſome, leading from the Mamillary Proceſs into the Ventricle of the forepart of the Brain.*

I. I. *The Hemiſphear of the Brain opened and ſeperated by it ſelf.*

The reſt here deſcribed are explained in the former Figures.

CHAP. V.

The Beginnings and Increaſe of the whole Corporeal Soul; alſo ſome Innate Habits and Inclinations of it are noted.

FRom what has been ſaid, concerning the *Hypoſtaſis* and Members of the Corporeal Soul, or of the more perfect Brutes (which is alſo the inferiour Soul of Man) it will be eaſier to trace out the Original, and the Increaſe of the whole. From hence alſo we may collect its figure and dimenſions, as alſo the proportion, habits, and inclinations of its parts, in reſpect of it ſelf, and the members of the Body, together with its Various ways of acting and ſuffering.

The beginning of the Brutal Soul.

As to the firſt beginnings or original of the Corporeal Soul; this, (like as a Shell-fiſh forms and fits its ſhell to its ſelf) exiſts ſomething a little ſooner, and ſo more nobler than the organical Body; Becauſe a certain heap of animal Spirits, or moſt ſubtil Atoms, or a little Soul not yet inkindled, lies hid in the Seminal humour; which having gotten a fit cheriſhing or Fire-place, and at length being inkindled from the Soul of the Parent acting, or endeavouring, or leaning to it, as a flame from a flame, begins to ſhine forth, and to unfold it ſelf, a little before the Foundations, or firſt ground-work of the body is lay'd: This orders the web of the conception, agitates and inkindles the applyed matter, diſpoſes, and by degrees forms the Figure, deſigned by the Archetypal Law of Creation. In this ſtupendious Fabrick, together with its bodily bulk, being daily increaſed, and Imaged into the due Species of each animal, the Soul alſo takes its increaſe, and ſtill renders it ſelf like to the Body, which it forms. For when as the more thick particles, from matter continually put together, are beſtowed in the Corporeal Organs; in the mean time, the more ſubtil and ſpirituous being looſned, and more rarefied, by the burning of the others, they dilate the *Hypoſtaſis* of the Soul, and together with the Body unfold, and equally extend it. But that after this manner, the Seeds of the Soul being laid, from the beginning, together with thoſe of the Body, do riſe up to a due figure and bulk in either, it ought not to be attributed to the fortuitous concourſe of Atoms, nor to the proper Energie of the Soul it ſelf; but the beginning of all things, proceeds wholly from divine Providence, directing Generations, to the Ends and Ideas of Forms, according to the original Types primitively ordained by the ſame.

Frames it ſelf before the Body.

And increaſes likewiſe with it.

The duration alſo of the Body depends upon the Soul.

Secondly, As the Increaſe of the animated Body, and the firſt marrying together of the Elements proceed from this Soul, informing and diſpoſing the matter; ſo the duration and ſubſiſtence of the ſame Soul, is the Bond of its Mixture or Concretion. For the ſtame of the Soul being extinct, or the inkindling and motion of the ſubtil particles ceaſing, preſently the frame of the Body it ſelf begins to be diſſolved and looſned, ſo that in a ſhort time, the Elements being looſned and laxed one from another, fly away, and by degrees break their Concretion: wherefore this Soul, as it were ſalt or pickle preſerves the fleſhy bulk of the Body from putrefaction; yea, the ſame is almoſt in an animated Body, as the Flower or Spirit in Wine, which indeed being preſent, and unfolding its ſpirituous Particles thorow the whole, the Liquor continues ſtill generous and flouriſhing; but as ſoon as this Spirit of the Wine flies away, forthwith the remaining water or liquor degenerates into an inſipid and dead thing.

The Soul always Born.

Thirdly, So long as this Soul ſubſiſts in the Body, according to an ancient ſaying of *Hypocrates*, *It is always Born, even till Death*; In which reſpect alſo, it ſeems to be moſt like flame, or rather the ſame thing, which is continually renewed almoſt every moment: Some parts of either's ſubſiſtence, in like manner are conſumed by burning, and fly away, and others in the mean time are laid up anew, from the Food continually laid in: For as the

more

more Craſs or thick Particles of the nouriſhing juice, wrought in the Viſcera, fill up the loſſes of the Corporeal bulk, ſo the more ſubtil make up the layings forth or waſtings of this Soul; which, as they come to the blood, are as it were Oyl to a Lamp, and being perpetually inkindled within its boſom, reſtore to the Soul both Flame and Light, which would otherways periſh. For whilſt the purer part of the nouriſhing Liquor, cheriſhes the flame of the Blood, and ſuſtains it, the moſt ſpirituous Particles falling off by its burning, are inſtilled into the concavity of the Head, which there propagate and nouriſh the other part of the Soul, to wit the Senſitive: So the making of Blood, is owing very much to Chylification, or the making of the Chyle, and Animality or like to this; notwithſtanding which offices, the Animal Function payes back to the Vital, and both to the Organs of Chylification; for as much as the Animal Spirits, beſtow a pulſifick force to the Heart and Arteries, whereby the Blood may be agitated and carryed about, to the places of accenſions or inkindlings: yea, the Viſcera of Concoction, receive heat which they want, from the flame of the Blood, and a motive and ſenſitive virtue, which they have need of, for their Offices, from a Conſtant afflux or flowing in of the Animal Spirits; ſo the Brain is indebted to the Heart, and both of them to the Stomach, yea, and on the other ſide, this Region to that, and both to the third. To the end that the *Hypoſtaſis* of the whole Soul might the longer continue, the Tributes of all the Parts are Compenſed with mutual Offices one to another, and ſo at once the members both of the Body and of the Soul being conjoyned, by a Circular neceſſity, they deſire and ſhew their mutual Labour.

The Offices of the Organs and Faculties, are reciprocal towards one another.

It is natural to the Soul to defend it ſelf, and to propagate its ſpecies.

Fourthly, The Soul of the *Brute*, as it is Fire, according to Philoſophy, has theſe two innate Diſpoſitions by the Law of Creation, to wit, that it ſhould defend it ſelf, or delay its proper inkindling long, for whoſe ſake it is ſtill careful of taking of food; and alſo, that it might propagate its Species, or produce other Souls; for which end, it Continually lays up from its proviſion, an incentive matter, and Continually deſires to expoſe it to an inkindling.

Hence the young one as ſoon as it is born, ſeeks for food.

It is natural for every Animal, without guide or example, to take its proper food, and to Swallow it down, both that the web of the Body being daily increaſed, might grow to its due magnitude, and alſo that the Soul, as it were its woof, being daily ſupplyed with new plenty of Spirits, may be able to be Coextended or ſtretched forth equally with the Body, and able to perform lively the Acts of its Functions. Then aſſoon as the Lineaments, both of the Body and the Soul, being ſufficiently drawn forth, and the Compaſs and Bulk of each Compleated, ſome Animal Spirits, ſuperfluous from the individual work, begin to abound, and ſo ſeperate into the genital parts, with a Subtil humour, picked from the whole Body, as it were into a Store-houſe, deſtinated for the propagating the Species, and there being lay'd up, forme the Idea of the Animal, which afterwards is transferred into a fit Matrix, for to be perfectly formed.

When the Individuum is made the genital humor, for the propagating the Species, is lay'd up.

The Genital Humor, not from the Brain, but from the Blood.

The genital Humour, is not, as *Hippocrates* formerly taught, and as now commonly believed, carried from the Brain into the Spermatick Veſſels; for no peculiar paſſages lye between that, and theſe Bodies far remote; but without doubt, the bloody maſs it ſelf, ſends its moſt noble part into the Genitals, as well as into the Brain. Wherefore, when as there are no Nerves that reach to the Teſticles, and that there are noted Arteries ſent, and admirably made thorow wandering Paſſages and frequent engraftings of the Veins; to wit for that End, that they may carry the moſt pure flower of the Blood, as it were thorow the winding Chanels of an Alembick, diſtilled by a long paſſage, and ſo wrought and made moſt highly ſubtil, into thoſe parts: what is ſuperfluous of this or leſs clarified, the Veins do not only receive and carry back, but alſo becauſe from the much Spirit, a great quantity of Serous water (which ſerves always for its Vehicle) abounds, therefore the Water-Carryers are produced in theſe parts abundantly more than in any others.

why the loſs of ſeed diſturbs the Brain and Nerves.

But that a great loſs of the genital Humor doth hurt very much the Brain and the Nerves, and bring to them a notable debility; the reaſon is, becauſe the blood as it makes up the loſſes of the ſeed, deſtinated for the propagating its Species, carries thither and beſtows whatſoever is moſt precious of its own; in the mean time, as the Brain is defrauded of its due proviſion, by the great plenty of Spirits being carried into the Spermatic Bodies: yea as the blood is not able ſufficiently to impart to the Genitals, out of its proper ſtore, it remands or ſnatches its Tribute from the Brain and other parts, that it might be there beſtowed; ſo that not ſeldom the ſtrength of the whole Soul and Body is conſumed, on the mad inſatiate fulfilling of Luſt or Venus; and in theſe deſires, every one, or the unskilful, complains of Flames, and feels the blood not only to flame forth, but a greater fire increaſing, to make hot the marrow, yea oftentimes it is known to burn up the Fleſh, Inwards, and Bones, and to reduce them to a rottenneſs.

As

As to that moſt quick and Intimate Commerce of the brain, with the genital Members, for as much as the Venerian imagination Cauſes preſently an inſurrection in theſe parts, and on the other ſide a ſwelling up of the ſeminal humor, ſtirs up the Venerial Imagination, the Cauſe is, not an Inſtinct thorow the private paſſages of the Nerves, (which are wholly wanting) reciprocated from this to that; but, becauſe for the Act of Generation, greatly neceſſary, and performed with a moſt vehement Affection, one part of the ſoul by it ſelf, or one part after another is not moved, but the whole *Hypoſtaſis*, together, and on a ſudden, and is inclined or ſnatched towards the Genitals; hence every moſt light incentives of Luſt, are moſt ſwiftly powred forth thorow the univerſal parts of the Soul, fiery of themſelves, and Extreamly perclive or apt for ſuch fires.

From whence is this Wonderful Commerce of the Brain, with the Genital Members.

Whilſt this Corporeal Soul, being inkindled like flame, in the animated Body, on every ſide diffuſeth Heat and Light, we may take notice of its various tremblings, ſhakeings, inequalities, and irregular Commotions; theſe ſorts of Irregularities, to be obſerved, concerning the *phaſis* or appearance of this Soul, of which we treat, tho they are more perſpicuous in Man than in Brute Animals, yet they altogether reſpect the inferiour Soul of Man, which is Common to him with the Brute Animals. But that we may briefly handle ſome of theſe Affections of the Corporeal Soul, firſt it is to be noted, that its flame does not always flame forth equally: For beſides that its food is ſometimes afforded more plentifully, and too ſulphureous, ſometimes more thinly and leſs inflameable, ſo that the Flame is inlarged or Contracted, its accenſion alſo, in the præcordia, tho of it ſelf moderate and equal, is wont to be variouſly ſhaken, by the fanning of Paſſions, ſo that it is carried forth ſometimes into an Exceſſive burning, as from Anger and Indignation; ſometimes this vital flame is in danger to be always blown out, as by ſudden Joy, and another time almoſt ſuffocated, as by ſudden fear or ſadneſs; In like manner the *Syſtaſis* or Conſtitution of the Soul, from the reſt of the Affections, being expoſed as flame to the winds, is diverſly changed in its appearance, as will more clearly appear, when we ſhall ſpeak particularly of its Affections.

The Soul, like Flame, has inequalities Trepidations &c.

The Flame of the Soul is ſometimes enlarged by paſſions.

Nor do theſe ſorts of Inordinations only proceed from the ſudden impulſes of Paſſions, but ſometimes, the Vital flame, habitually becomes decayed, weak, and as it were half exſtinct, as by intemperate Cold, and alſo as is obſerved in the phlegmatick diſeaſe, the dropſie, longing of maids, and other diſeaſes; in whom the Blood being too watery, like moiſt and green wood, ſends forth but a ſmall and inconſtant flame and almoſt overwhelm'd with fume and vapour: But ſometimes the bloody Liquor being more ſulphureous than it ought, is almoſt wholy inkindled, as happens in a Choleric Complexion, and in an intemperate Feavor: According to either of theſe hights, as the inkindling of the vital flame is altered, ſo the lucid particles, which flow from it, to wit the beamie texture of the Animal ſpirits, diverſly ſhines, and breaths forths from the decayed or bound up inkindling of the Blood, the ſphear of the ſenſitive ſoul is ſeen to be ſtraitned, and to be drawn in, within the limit of the Body, and to be immerged or ſunk down ſo that it doth not ſufficiently actuate or illuſtrate the whole frame of the Brain, and its Appendix: On the Contrary, when the Vital Fire is very ſtrong (ſo it doth not burn forth too much and feavouriſhly) the Conſtitution of the Animal Spirits being made greater in it ſelf, is much inlarged forth far beyond the Compaſs of the Body, ſo that any one exulting for Joy, or blown up with pride, is ſeen to grow very great, and not be able to be contained within its proper Dimenſion.

Sometimes Contracted

The ſame habitually is now decayed.

Now intenſe or ſtrong.

Alſo the lucid part of the Soul ſhines diverſly.

And is altered on the part of the Fame.

Beſides theſe Kind of Alterations, which the Soul properly ſenſitive, or the lucid part, receives, from the Vital and flamie, variouſly changed; many other things happen, which diſturb its *Syſtaſis* or Conſtitution, and its wonted manner of Order, immediately both from a certain affection of the Brain, and Nervous ſtock, and alſo from external Objects becauſe in the night, the Brain it ſelf, from a too great infuſion of the nutricious Juce, or from the black darkneſs, or vapours, is filled, ſo that the lucid part of the Soul in ſleep, is wholly obſcured, as it were with darkneſs; not ſeldom from a morbific matter ſomewhere gathered together, and as it were obſtructing the Spirts, or the ways of their Beams, there ariſes an Eclipſe of ſome or more of their faculties; ſometimes the Animal Spirits themſelves are not light or airey enough, but are infected with heterogeneous effluvia's, to wit, either Saline, Vitriolic, Nitrous, or otherwiſe Cloudy, which deform the ſenſible ſpecies, change them into ſome affrightful thing, and excite inordinate Motions: Hence it comes ſometimes that the whole Soul ſuffers various Metamorphoſes or Changes, and puts on ſtrange ſpecies's, as often happens in Melancholy diſeaſes, or to mad men.

Alſo from the Various affection of the Brain and Nervous ſtock.

As to the various geſtures of the Soul, by which for the variety of ſenſible objects it expreſſes now Joy and Pleaſure, by and by loathing and trouble, it is obſerved, that ſometimes it is allured more outwardly by the Organ of this or that ſenſe, and as occaſion ſerves almoſt wholly to wander into the Eye or Ear, Palate or any Senſory meeting with ſome-

Alſo from the various incurſions of ſenſible things.

ſomething pleaſant; ſometimes on the Contrary, for the ſake ſhunning or flying away from ſome approaching evil, that ſhe retires inwardly, and leaving her watch, hides her head; ſo that we think or Imagine nothing without being touch'd, but that the whole Soul almoſt is moved, and trembles at every apprehenſion of the ſenſible object, and its *Syſtaſis* is variouſly agitated, as it were the leaves of a Tree, expoſed to the blaſts of Winds.

Alterations of the Flamy part of the Soul impreſſed by the Lucid.

Nor do theſe ſenſible Impreſſions induce Metamorphoſes only to the ſenſitive ſoul, or the beamy Texture of the Animal ſpirits; but undulations or waverings being brought to it, preſently they go forward, and impreſs alterations on the vital Soul, lying in the blood, and move about its flame, as it were with blaſts, driving it hither and thither, and unequally inkindling it. For as we mentioned before, the ſame moment, in which an object carried from the ſenſe or memory, ſtops at the Imagination, as that Comes under the ſhew of good or evil, it affects the Animal Spirits deſtinated to the Motion of the Precordia, and cauſes the Precordia, by the influx of them, to be variouſly Contracted or dilated, and for that Cauſe it is, that the inordinate motions, and inkindling of the Blood, are ſo performed. But of theſe there will be a more opportune place of treating, when we ſhall ſpeak eſpecially of the Affections of the Soul.

CHAP. VI.

Of the Science or Knowledge of Brutes.

WE have hitherto ſpoken of the Original Nature and manner of the Soul of the Brutes, ſubſiſting in the Body, as alſo of its various degrees or ſpecies, and as it hath in the more perfect Living Creatures Parts or Conſtitutive Members. Further, the *Hypoſtaſis* figure, and dimenſions of the ſame Soul, being rightly delineated, we have Conſidered, how that ſhe is capable of Impreſſions from outward Objects, alſo to what paſſions and alterations beſides ſhe is obnoxious: yet from all this furniture of the Corporeal Soul, and of its powers being put together, it doth not plainly appear, what the ſame is able to do beyond the Virtue or force of any other machine, and to perform by its own proper Virtue or ſtrength. For altho an Impreſſion of an Object driving the Animal ſpirits inwards, and harmonizing them by a certain peculiar manner, cauſes ſenſation; and the ſame ſpirits, for as much as they leap back from within outwardly, as it were by a reflected undulation or waving, ſtir up local motions; yet it is not declared how this Soul, or any part of it, perceives it ſelf to feel, and is driven according to that perception into divers Paſſions and Actions, directed to the Appetite or deſire of this or that Action; and ſometimes, as we have generally obſerved in ſome Beaſts, for the proſecution of the deſired thing doth pick out and chooſe Acts, which ſeem to flow from Council, or a certain Deliberation. In Man indeed it is obvious to be underſtood, that the Rational Soul, as it were preſiding, beholds the Images and Impreſſions repreſented by the ſenſitive Soul, as in a looking Glaſs, and according to the Conceptions and notions drawn from thence, exerciſes the Acts of Reaſon, Judgment, and Will. Yet after what manner in Brutes, Perception, a diſcerning or diſcrimination of Objects, Appetite, Memory, and other ſpecies or Kinds of Inferiour Reaſons as one may ſay, are performed, ſeems very hard to be unfolded; therefore, when ſome could not ſolve this Knot or difficulty, they attributed to Brutes Immaterial Souls, and ſubſiſting after their Bodies. Which if that were true I Know not why Four footed Beaſts ſhould not be indued with reaſoning and underſtanding as well as man, yea and might learn Sciences and Arts; for as much as in either, beſides their immaterial ſouls alike, there is altogether the ſame Conformation of the Animal Organs; upon which indeed it appears, that the Rational Soul whilſt in the Body, hangs or depends as to its acts and habits, becauſe the Organs being hurt, or hindred, a privation or an Eclipſe of theſe ſucceeds: wherefore that the Soul of the Brute uſing the ſame Organs as man, can Know nothing clearly, nor riſe above the Acts and material Objects, it planly follows, that ſhe is different from the Rational Soul and alſo that ſhe is much inferiour and Material.

The Soul of the Brute is ſtrong in ſenſe and motion as a Machine.

But wonderful how by perception.

If the Soul of the Brutes be immaterial, it is alſo rational.

But that it is objected, that all matter whatſoever is not only inſenſible and ſluggiſh, but alſo meerly paſſive, therefore incapable of ſenſe and animal activity, omitting here many inſtances of æquivocal productions, the *Epicureans* affirm to be

equally

equally ſtupendious and inexplicable, of which we ſhall diſcourſe anon; we ſhall propoſe as to the former, this one thing, as very Conſentaneous to our *Hypotheſis*; to wit, that there is not much more difference between an inſenſible and a ſenſible Body, than between a thing unkindled, and a thing kindled; and yet we ordinarily ſee, this to be made from that; why therefore in like manner, may we not judge a ſenſible thing, or Body to be made out of an inſenſible? Every matter, as it is not Burnt, ſo not animated; but being diſpoſed, by either of the active Elements, it behoveth it to be indued with Spirit chiefly, with Sulphur and Salt: Combuſtible things, as Oyl, Roſin, Wood, and the like, of themſelves torpid and ſluggiſh, lye unmoved without fire, heat, or ſome agitation of the parts or particles: But as ſoon as they have taken flame, from ſome incentive being put to it, by and by their Particles being rapidly moved, and as it were animated, produce a ſhining with Heat and Light; and not only make light all about them, but Create innumerable Images, of all things that are ſeated near them, and thickly object them on every ſide: In like manner, the Vital humour in an Egg, remains torpid and ſluggiſh in the beginning, and like to unkindled matter; but as ſoon as it is actuated, from the Soul being raiſed up, preſently like an inkindled fire, it excites Life with Motion and Senſe, and in the more perfect Creatures with heat. Further, the Animal Spirits as Rays of Light, proceeding from this Fire, are Configured according to the Impreſſions of every of their Objects, and what is more, as it were meeting together with reflected irradiations, cauſe divers manner of motions.

A ſenſible thing or Body, is produced from an inſenſible, as an inkindled Body from one not kindled.

Then what is vulgarly delivered, that Matter, out of which Natural things are made, is meerly paſſive, and cannot be moved, unleſs it be moved by another thing, is not true; but rather on the contrary, Atoms, which are the matter of ſublunary things, are ſo very active and ſelf-moving, that they never ſtay long, but ordinarily ſtray out of one ſubject into another; or being ſhut up in the ſame, they cut forth for themſelves Pores and Paſſages, into which they are Expatiated.

That matter is not meerly paſſive.

Yet it may be argued, That if the Soul of the Brute be Compoſed out of theſe, whilſt the ſame is Extended and is Corporeal, it cannot perceive. For it admits the Species of the Object into its whole ſelf, or into ſome part of it ſelf, not the firſt, becauſe then neither the Senſes would be diſtinguiſhed one from another, nor any of them by a perception or common ſenſation of theſe: But if (as indeed it is) it ſhall be ſaid, that all the ſenſible Species being received by appropriated Senſories, to a certain part of the Soul, to wit, the firſt or common Senſory, where they are perceived: Then it may be again objected, That ſo manifold and divers Species or Images of ſenſible things, which at once are Conceived, from Objects, cannot be painted forth in a certain ſmall part of the Brain, but that ſome ſhould obliterate or blot out, or at leaſt Confound others: I ſay none ought to wonder, who hath beheld the Objects of the whole Hemiſphere, admitted thorow an hole into a dark Chamber, and there on a ſudden upon Paper exactly drawn forth, as if done by the Pencil of an Artiſt: Why then, may not alſo the Spirits, even as the Rays of light, frame by a ſwift Configuration, the Images or Forms of things, and exhibit them without any Confuſion or Obſcuring of the Species?

But ſometimes too active.

The common Senſorie is not the whole Soul, but a certain part of it.

This receives all ſpecies without Confuſion.

But yet, tho it be granted, That the Images of ſenſible things are repreſented in a certain part of the Soul, to wit, actuating the Brain it ſelf; to which there happens a moſt ſpeedy Communication, with the whole, and alſo with the ſeveral Parts: however, we are yet to inquire of what Kind of power that is, which ſees and knows ſuch like Images there delineated, and alſo according to thoſe Impreſſions there received, chooſeth Appetites, and the reſpective Acts of the other Faculties.

How this perceives that her ſelf feels or knows.

That we may go on to Philoſophize concerning this matter, I profeſs indeed, whilſt I conſider the Soul and the Body, to wit, either of them by it ſelf and diſtinct, I cannot readily detect, in this, or in that, or in any material ſubject, any thing, to which may be attributed ſuch a Power, with a ſelf-moving energy: But indeed, when I conſider the animated Body, made by an Excellent and truly Divine Workmanſhip, for certain Ends and Uſes, nothing hinders me from ſaying, That it is ſo framed by the Law of Creation, or by the Inſtitution of the moſt Great God, that from the Soul and Body mixed together, the ſame Kind of Conſluence of the Faculties doth reſult, by which it is needful for every Animal, to the Ends and Uſes deſtinated to it.

In moſt Mechanical things, or thoſe made by humane Art, the Workmanſhip Excels the matter: who would think there could be an Inſtrument made out of Iron or Braſs, being moſt fixed and ſluggiſh Mettals, whoſe Orbs like to thoſe of the Celeſtial, without any external Mover, ſhould obſerve almoſt continual motions, the Periods of which being renewed at a conſtant turn or change, ſhould certainly ſhew the ſpaces of Time? No Body admires that a rude and ſimple ſound is given by wind, blown into a Pipe; but indeed, by Wind ſent into muſical Organs, and that being carryed variouſly thorow manifold openings of Doors, into theſe or thoſe pipes, that it ſhould create a moſt grate-

As in mechanical things, ſo much more in an animated body the work is more excellent than the matter.

ful Harmony, and Compoſed Meaſures of every Kind; this I ſay deſervedly amazes us, and we acknowledg this Effect, far to Excel both the matter of the Inſtrument, and of the hand of the Muſitian ſtriking it. Further, altho the Muſical Organ very much requires the labour of him playing on it, by whoſe direction, the ſpirit or wind being admitted, now into theſe, anon into thoſe, and into other Pipes, cauſes the manifold harmony, and almoſt infinite Varieties of Tunes; yet ſometimes I have ſeen ſuch an Inſtrument ſo prepared, that without any Muſitian directing, the little doors being ſhut up, by a certain law and order, by the mere Courſe of a Water, almoſt the ſame harmony is made, and the ſame tunes, equal with thoſe Compoſed by Art. And indeed Man, ſeems like to the former, in which the rational Soul, ſuſtains the part of the Muſitian playing on it, which governing and directing the animal ſpirits, diſpoſes and orders at its pleaſure, the Faculties of the Inferior Soul: But the Soul of the Brute, being ſcarce moderatrix of its ſelf, or of its Faculties, Inſtitutes, for Ends neceſſary for it ſelf, many ſeries of Actions, but thoſe (as it were tunes of harmony produced by a water Organ, of another Kind) regularly preſcribed by a certain Rule or Law, and almoſt always determinated to the ſame thing.

A ſelf moving muſical Organ.

To which the ſoul of the Brute is like.

This indeed holds good, concerning the more imperfect Brutes, in whoſe Souls or Natures are inſcribed the types or ways of the Actions to be performed by them, which they rarely or never tranſgreſs or go beyond; and that according to the vulgar ſaying in the Schools, *They do not ſo much act, as are acted*: yet in ſome more perfect Brutes, whoſe Actions are ordained to many and more noble Uſes, there are far more Original Types, and to their Souls there ought to be attributed a certain faculty of Varying their Types, and of Compoſing them in themſelves; for the Brutal Soul it ſelf, being ſo gifted naturally, as ſhe is Knowing and Active, concerning ſome things neceſſary for it; ſhe is taught through Various Accidents, by which ſhe is wont to be daily affected, to know afterwards other things, and to perform many other, and more intricate Actions: But how all this may be done, (without calling an immaterial Soul into play) to wit, by what helps, whether innate or adventitious, or acquired, the Science of the Brutes is gotten or polliſh'd, will be worth our Labour to ſhew a little more fully: that it may appear at length, what is the utmoſt thing that living Brutes can know or do, and how far that is below the power of the Rational Soul.

The more perfect Brutes are indued with knowledge.

Therefore, that we may ſeek out as it were the ſeveral footſteps, by which all brute Animals are imbued with the Knowledg of things; we ought firſt to diſtinguiſh here, that ſome of their Knowledg is born with them, as we but now hinted, to wit, for ſome Uſes needful for the lengthning of Life, being infuſed by the moſt high Creator, and impreſſed like a Character, from their firſt formation, on the beginnings, or on their very Natures themſelves, which is wont commonly to be called *Natural Inſtinct*: But others acquired, to wit, which by degrees is learned, by the incurſion of ſenſible things, Imitation, humane Inſtitution, and other ways, and is carryed to a greater degree of Perfection in ſome than in others; yet in ſome, this acquired Knowledg, as alſo Cuning, depend wholly on the natural Inſtinct, and being poliſhed by frequent uſe and habit, and Carried a little further, ſeem to be certain additions only.

That is either inbred.

Or acquired.

First, As to what regards natural Inſtincts, it is a great and moſt ancient Notion, That there is in all Living Creatures, an innate Conſervation of themſelves, to wit, that every Individual might preſerve it ſelf as long as it can: This is a Law of Divine Providence, inbred in all Creatures, which gathers together the Principles of Life like a Bond, otherways apt to be diſſipated and to depart one from another, and on which, as the Baſis, the Duration or Continuance of the whole World ſtands.

What natural inſtinct is.

This being ſuppoſed, it neceſſarily follows, that all Animals ordained for this end, are furniſhed alſo with certain fit means, for following the ſame, wherefore they ought to know by Natural Inſtinct, whatſoever things are Congruous and benign, and what are incongruous or hurtful to them, and that they ſhould follow theſe with hatred and averſion; and thoſe with Love and delight. Hence it is, that every one of them are able to chooſe Food proper for themſelves, and to ſeek it being abſent, and remote from their Eyes; And from an implanted diſpoſition of their Nature, are skilful to know and oppoſe Enemies, to love their Friends, to get a female fit for themſelves, and to make ready whatever may conduce to the Procreating and Cheriſhing their Young; beſides many other Kinds of powers and habits, granted to us not without Learning and Study, are originally fixed on the *Præcordia* of the Beaſt.

What it brings to the Brutes.

And truly, if we look upon the Ingenuity and Proprieties of all Animals, we ſhall find theſe Kind of Effects after a manner in all: For many of them are no ſooner brought to light, but they ſeek and greedily embrace remedies againſt hunger and Cold, without any guide or ſhower; then being ſomewhat grown up, tho Carefully Kept from all their Companions, yet without any one to ſhew them, or any example, they

Some examples and inſtances of it.

they of their own accord perform the peculiar Actions of their Kind. A Lamb juſt brought forth, and ſcarcely out of the after-birth, preſently ſnatches at and ſucks the Duggs of its Dam. A Chicken, as ſoon as out of the ſhell, will pick up grains of Corn, hides it ſelf under the wings of the Hen, and flyes from the approach of the Kite. Cattel feeding in the Paſtures, are more skilful than Men, about the Virtues of Herbs; for they eaſily diſcern at the firſt taſt, what are for food, what for Medicine, yea, what is to be ſhun'd, being imbued with poyſon and death; when we in the mean time, unleſs taught by experience, are wholy ignorant of their Virtues or poyſonous force: ſo that *Pliny* Complained, that it was a ſhame, that all Animals Knew what was healthful for themſelves, beſides Man.

Natural Inſtinct dictates to Brutes, what is wholeſome and what unwholeſome.

Neither does what ſome object otherways determinate this matter, that the means of theſe Kind of effects, depend only upon the ſimilitude or the diſſimilitude of Patricles, which are in the ſenſible and the Senſory, without any intention of the Beaſts, or End of their Acting; becauſe we have obſerved, that Brute living Creatures, by the Virtue of natural Inſtinct, perform not only ſimple actions, ſtirred up by one Impreſſion of the External agent, as when the heat of the Sun invites to take the Cool of that ſhade, but they perform and do manifold works, and Continued by a long Series. Birds by reaſon of the Influence of the Spring, being inſtigated to the begetting others apply themſelves to that buſineſs, without any other provoker or director, as it were Conſultingly and premeditated; for they enter into wedlock, as it were by a ſolemn manner of Eſpouſals, they chooſe a fit place for the building their neſt or habitation, where they make it moſt artificially beyond the skill of humane Architecture; then they lay Eggs, and by ſitting on them bring forth young ones, and then carefully nouriſh them with food which they get for them. We might here alſo take notice of the moſt admirable Republiques of Bees and Ants, in which, without any written Laws or promulged Right, the moſt perfect ways of Government are exerciſed. But as in all theſe without any Variety, one thing is always and wholy after the ſame manner adminiſtred, it is a ſign, that theſe Kind of principles or beginnings of the Brutes, are nor ſtirred up either by external objects, whoſe Impulſe is ſtill various and divers, nor from an internal propoſition of the Mind, which is more mutable than the wind; But excited from a more fixed and Certain principle, determinate always to one thing, which can be only Natural Inſtincts: The World is full of Examples of this ſort, which teſtifie the native indowments and implanted Ingeny of Brutes: For in all Animals, there are by Nature a Certain Ingeny and habit born with them, by which they are inſtigated through a ſecret impulſe and blind power to the performing of Actions, which reſpect both the Conſervation of themſelves, and the propagation of their Kind; and theſe Gifts being originally granted, conſtitute as it were the firſt lineaments or groundwork of practical Knowledge, with which the Soul of Brutes are wont to be imbued: then an acquired Cognition being ſuperadded to thoſe rudiments, fills up the vacuities of thoſe things drawn forth, and adds a perfection to the former foundation.

Leads not only to ſimple Actions but alſo to very Complicate Actions.

But yet thoſe always, and in all, of one Kind only.

For Secondly, beſides the natural Inſtincts, living Brutes are wont to be taught by ſenſible ſpecies, to wit, to profit in the Knowledge of ſeveral things, and to acquire certain habits of practice: But this happens not equally to all nor at all times. For in many Animals newly brought forth, natural Inſtinct is of ſome force, but then the Impreſſions of ſenſible things little or nothing affect the ſenſitive ſoul: Becauſe, altho the flamy part of the Soul is enough inkindled in the Brain, yet becauſe the Brain and its Appendix, abounds with much humidity, therefore the SpirituousEffluvias, or the lucid part of the Soul which ought to irradiate theſeBodies, is very much obſcured, as the beam of theSun paſſing thorow a thick Cloud: Wherefore at this time, the ſtrokes of ſenſible things, being not deeply fixed, are preſently obliterated, and in them local motions hardly follow: yea in ſome Beaſts, in whom the Blood being continually and habitually thick, and who have a leſs Clear Brain, tho through their whole Life ſome acts of the Exterior Senſes and Motions are performed, yet few Characters are left, of any interiour Knowledg. Wherefore, we ſhall here inquire only concerning Brutes, that are more docil, to wit, in whom are beſides local motions, and the five Exterior Senſes, Memory, and Imagination; and in theſe we may conceive this kind of Introduction, or Method of Inſtitution, concerning the Exquiſite Knowledge, by the ſenſe with which they are wont to be imbued.

2. *Brutes, in ſome things, are taught by the Impreſſions of ſenſible things.*

Therefore, as ſoon as the Brain in the more pefect Brutes grows Clear, and the Conſtitution of the Animal Spirits becomes ſufficiently lucid and defecated, the exterior Objects being brought to the Organs of the Senſes, make Impreſſions, which being from thence tranſmitted, for the continuing the Series or Order of the Animal Spirits inwards, towards the ſtreaked Bodies, affect the Common Senſory; and when as a ſenſible Impulſe of the ſame, like a waving of Waters, is carried further into the Callous Body,

The direct ſenſible Species creates in them the Phantaſie and the Memory.

and thence into the *Cortex* or ſhelly ſubſtance of the Brain, a Perception is brought in, concerning the Species of the thing admitted, by the Senſe, to which preſently ſucceeds the Imagination, and marks or prints of its Type being left, conſtitutes the Memory; But in the mean time, whilſt the ſenſible Impreſſion being brought to the common Senſory, effects there the Perception of the thing felt; as ſome direct Species of it, tending further creates the Imagination and Memory; ſo other reflected Species of the ſame Object, as they appear either Congruous or Incongruous, produce the Appetite, and local motions its Executors; that is, the Animal Spirits looking inwards, for the Act of Senſion, being ſtruck back, leap towards the ſtreaked Bodies; and when as theſe Spirits preſently poſſeſſing the Beginnings of the Nerves, irritate others, they make a deſire of flying from the thing felt, and a motion of this or that member or part, to be ſtirred up: Then, becauſe this Kind, or that Kind of Motion ſucceeds once or twice, to this or to that Senſion, afterwards, for the moſt part, this Motion follows that Senſion as the Effect follows the Cauſe: and according to this manner, by the admitting the Idea's of ſenſible things, both the Knowledg of ſeveral things, and the habits of things to be done, or of local Motions, are by little and little produced: For indeed, from the beginning, almoſt every Motion of the animated Body is ſtirred up by the Contact of the outward Object; to wit, the Animal Spirits reſiding within the Organ, are driven inward, being ſtrucken by the Object, and ſo (as we have ſaid) conſtitute Senſion or Feeling; then, like as a Flood ſliding along the Banks of the ſhore, is at laſt beaten back, ſo, becauſe this waving or inward turning down of the Animal Spirits, being partly reflected from the Common Senſory, is at laſt directed outwards, and is partly ſtretched forth even into the inmoſt part of the Brain, preſently local Motion ſucceeds the Senſion; and at the ſame time, a Character being affixed on the Brain, by the ſenſe of the thing perceived, it impreſſes there, Marks or *Veſtigia* of the ſame, for the Phantaſie and the Memory then affected, and afterwards to be affected; but afterwards, when as the Prints or Marks of very many Acts of this Kind of Senſation and Imagination, as ſo many Tracts or Ways, are ingraven in the Brain, the Animal Spirits, oftentimes of their own accord, without any other forewarning, and without the preſence of an Exterior Object, being ſtirred up into Motion, for as much, as the Fall into the footſteps before made, repreſent the Image of the former thing; with which, when the Appetite is affected, it deſiring the thing objected to the Imagination, cauſes ſpontaneous Actions, and as it were drawn forth from an inward Principle. As for Examples ſake, The Stomach of an Horſe, feeding in a barren Ground or fallow Land, being incited by hunger, ſtirs up and variouſly agitates the Animal Spirits flowing within the Brain; the Spirits being thus moved by accident, becauſe they run into the footſteps formerly made, they call to mind the former more plentiful Paſture fed on by the Horſe, and the Meadows at a great diſtance, then the Imagination of this deſirable thing, (which then is caſt before it, by no outward Senſe, but only from the Memory,) ſtops at the Appetite: that is, the Spirits implanted in the ſtreaked Bodies, are affected by that Motion of the ſpirits flowing within the middle part or Marrow of the Brain; who from thence preſently after their former accuſtomed manner, enter the origines of the Nerves, and actuating the Nervous Syſtem after their wonted manner by the ſame Series, produce local Motions, by which the hungry Horſe is carried from place to place, till he has found out the Imagined Paſture, and indeed enjoyes that good the Image of which was painted in his Brain.

The reflected be Appetit e.

The Appetite ſtirs up local Motion.

Which being often ſtirred up produce an habit of Acting.

After this manner, the ſenſible Species being intromitted, by the benefit of the Exterior Organs, in the more perfect Brutes, for that they affix their Characters on the Brain, and there leave them, they conſtitute the Faculties of Phantaſie and Memory, as it were Store-houſes full of Notions; further, ſtirring up the Appetite into local Motions, agreeable to the Senſions frequently, they produce an habit of Acting; ſo that ſome Beaſts being Taught or Inſtructed for a long time, by the aſſiduous Incurſion of the Objects, are able to know and remember many things, and further learn manifold works; to wit, to perform them by a Complicated and Continued ſeries and ſucceſſion of very many Actions. Moreover, this Kind of acquired Knowledg of the Brutes, and the Practical habits introduced through the Acts of the Senſes, are wont to be promoted by ſome other means, to a greater degree of perfection.

3. Brutes are alſo taught by experience.

For in the third place, it happens to theſe by often Experience that the Beaſts are not only made more certain of ſimple things, but it teaches them to form certain Propoſitions, and from thence to draw certain Concluſions. Becauſe, draught Beaſts, having ſometimes found water to be Cooling, they ſeek it far as a remedy of too much heat; wherefore, when their Precordia grow hot, running to the River they drink of it, and if they are hot in their whole Body they fearleſly lye down in the ſame. In truth, many Actions which appear admirable in Brutes

came to them at first by some accident, which being often repeated by Experience, pass into Habits, which seem to shew very much of Cunning and Sagacity; because, the sensitive soul is easily accustomed to every Institution or Performance, and its Actions begun by Chance, and often repeated, pass into a Manner and Custom. So it happens sometimes by Chance, among Hounds, that one had caught the prey, not exactly but by following a Shorter way; this Dog afterwards, as if he were much more Cunning than the rest, leaves the Hare making her turnings and windings, and runs directly to meet her another way.

4. By Example, Imitation, and Institution also

Living Brutes are taught by Example, by the Imitation and Institution of others of the same or of a divers Kind, to perform certain more excellent Actions. Hence it is that the Ape so plainly imitates Man, that by some, it is thought a more imperfect Species of him. For this Animal being extreamly mimical, as it is indued with a most Capacious and hot Brain, it imitates to an hair, almost all the Gestures that it happens to see, presently with a ready and expeditious Composing of its Members, and is furnished with a notable Memory, and retains all its tricks which it has once acted very firmly afterwards, and is wont to repeat them at its pleasure. They are very admirable habits, which Horses, Doggs, and Birds get, being carefully instructed by the Discipline of Man; and not only from Men but being taught first by their Companions, they imbibe altogether new and more Excellent Customs: so one Dog ordinarily teaches another to hunt, and one Bird another to compose harmonious notes and various tunes. It were an Easy matter to bring very many Instances of this Kind. But we shall hasten to other things.

How far it is that Brutes are able to Know.

Having thus enumerated the Chief Helps from Nature and Art, by which living Brutes do profit in the Knowledg of things, and are instructed by the Habits of Acting, we shall now inquire, to what hight most of them or all of them put together, can arrive.

First, from what we have said 'tis clear, that Living Brutes are directed to all things which belong to the Defence and Conservation of the Individuum, and that are to be done for the propagation of their Kind, by a natural Instinct, as it were a Law or Rule fixed in their Hearts: when as therefore we behold for these ends, ordained by Divine Providence, Brutes to order their matters wisely, and as it were by Council, no man Esteems this the work of Reason, or of any liberal faculty; yea they are led into these enterprises, by a certain Prædestination, rather than by any proper Virtue or Intention.

How natural Instinct is wont to be Compated with acquired Notions.

Secondly, The Natural Instinct of Brutes, happens, not rarely, with notions acquired by the sense, and being Complicated with them conduces to the Propositions or Assumptions to be done, Concerning many things, and the Deductions to be drawn from thence. A Dog being by a staff struck, or by the flinging of a stone, perceives the hurt received by the senses, and easily retains the Idea in his Memory, but the Instinct dictates to him that the like stroke may be shunned afterwards, wherefore, when he sees a staff held out before his eyes, or a stone taken up, fearing thence the like hurt, he hastily flies away.

With the Impressions of sensible things.

With Habits learnt from Example or Institution.

Thirdly, sometimes Instincts, and also all other acquired Knowledges, are mixed together, either with the Example of Habits, or with the general Institution of things learnt: And when as notions so arising from one faculty or power, answer to Actions drawn from another, from thence is produced a certain Kind of Discourse or Ratiocination, and often times it is continued by a certain Series or Thrid of Argumentation. Many admirable Histories are reported, concerning the Subtilties and Craft of the Fox, which he is wont to perform for the getting of his living. This Creature, that he might allure the Hens within the Compass of his Chain, with which he was tyed, lying all along, his legs stretched forth, feigns as if he were dead, then they coming near him, he readily leaps upon them. Moreover, I have heard it told, that a wild Fox, that he might get into his clutches a Turkie Cock roosting in a Tree, running round the Body of the Tree, with a swift Motion, continually beheld the Bird with an intentive Eye, by which Means, as the Turkie still followed the Fox thus running Round with his eye, carrying his head about till being infected with a giddiness, he fell down from the top of the Tree, into the mouth of his Enemy: I say, it was natural to the Fox, that he should desire domestick Fowl, as his prey; but that he should frame these Kind of Snares for them, this he must have by former acquired Knowledges, from Sence, Experience, and Imitation, and complicated with natural Instinct. It is very likely that the Fox had learnt by former Experience, that the Hens did not fear him lying as dead, which might happen by Chance, when being wearied, or to sleep, he had lay'd himself on the ground: In like manner, perhaps, when he had run about the Tree, seeking some way to get up into it, the Prey might fall down into his mouth; Wherefore afterwards when he would take his prey, he repeated the Series of the same Actions; because, what

With notions learnt from Experience and Imitation.

he

he had known to be done before, he preſumed might be done again. In both Caſes, and in others like them, the reaſon of the whole thing done, or the Endeavour, is reſolved into theſe Propoſitions; The Fox thinking, now to take the Prey, that is before his eyes, after what manner he may, remembers how he had taken the ſame formerly, by theſe or thoſe ſort of Cunning ways or Crafts, found out by ſome chance; Theſe are the Premiſes, the former of which is ſuggeſted from Nature, and the ſecond from Senſe and Experience, from whence a Concluſion follows, Therefore Foxes for the taking of their Prey, uſe again the ſame Wiles. According to this ſort of *Analyzing*, the moſt Intricate Actions of Brutes, which ſeem to contain Ratiocination, may be explained, and reduced into Competent notions of the ſenſitive Soul.

The Syllogiſms of Beaſts.

CHAP. VII.

The Corporeal Soul, or that of the Brutes, is Compared with the Rational Soul.

FRom what we have ſaid is to be underſtood, how much it is that Brute Animals are wont to do with the whole furniture of the Corporeal Soul, and to obtain towards the uſe of Reaſon: But now we ſhall endeavour to ſhew, how far they are below it, and how much leſs they are able to do than Man, endued with a Rational Soul. The means of obſerving the difference between theſe Souls are commonly to be had, being noted by divers Authors both Ancient and Modern and both Philoſophers and Theologiſts, till it is almoſt worn thread-bare, yet we will take leave to ſhew you only ſome few ſelect things, which for Methods ſake, we ſhall reduce to theſe three Heads: viz. 1ſt. It is ſhown, That man uſing expeditiouſly and freely the Powers of the Superiour Soul, of the Intellect, Judgment, Diſcourſe, and other Acts of Reaſon, ſhews them far excelling any Faculty or Science of the Brute, and the whole power of the Corporeal Soul. 2. By what Knitting the Corporeal Soul, and the Rational are joyned together, in the Humane Body, by what means they agree in the ſame habitation; alſo what offices they perform each. 3. Shall be declared, for what means, and for what occaſions theſe Souls differ among themſelves, yea ſometimes are wont to diſſent and move more than Civil Wars.

Three heads of this Diſcourſe viz. 1. It is ſhown that the Rational Soul far excels the Brutal.

2. How both Souls are joyned in Man, and

3. How they frequently diſagree among themſelves.

The eminency of the Rational Soul above the Brutal or Corporeal, ſhines clearly by comparing either, both as to the Objects, and to the chief Acts or Modes of Knowing. As to the former, when as every Corporeal Faculty is limited to ſenſible things, and every one of theſe to certain Kinds of things, the object of the humane Mind is every Ens, whether it be above, or ſublunary, or below the Moon, Material or Immaterial, true or fictitious, real or Intentional; wherefore *Ariſtotle*, who ſeemed to heſitate ſomething about the Nature of the Rational Soul, hinting its acting Intellect as if it were Immaterial and Immortal, doth pronounce it not only ſeparable and without Paſſion, but alſo unmixt becauſe it underſtands all things. *Lib. de Animâ* 3. *Cap.* 4.

The Priority of the Rational Soul as to

1. The Objects which are Every Ens.

2. The Acts of Knowing.

Secondly, The Acts or degrees of Knowledg, Common to either Soul, are Vulgarly accounted theſe three. To wit, ſimple Apprehenſion, Enunciation, and Diſcourſe; how much the Power of the Rational, excells the other Corporeal in each, we ſhall conſider:

The firſt Act of either Soul is ſimple Apprehenſion.

The power of this in Brutes is Phantaſie or Imagination.

Which is often deceived.

Firſt, The Knowing Faculty of the Corporeal Soul is Phantaſie or Imagination, which being planted in the middle part of the Brain, receives the Senſible Species, firſt only impreſſed on the Organs of ſenſe, and from thence by a moſt quick Irradiation of the ſpirits delivered inwards, and ſo apprehends all the ſeveral corporeal things, according to their Exterior Appearances; which notwithſtanding, as they are perceived only by the ſenſe (which is often deceived) they are admitted under an appearing, and not always under a true Image or Species. For ſo we Imagine the Sun no bigger than a Buſhel, the Horizon of the Heaven and the Sea to meet, and then the Stars not to be far diſtant from us in the Horizon, and that in reſpect of us, there are no Antipodes; further we may think the Image in the Glaſs, or in a Fountain delineates it ſelf, that the Eccho it ſelf is a Voyce coming from ſome other place, that the ſhore moves being on the water, yea and many other things, being received by the Senſories, whilſt Phantaſie is the only guide ſeem far otherways than indeed they are: But indeed, the Intellect preſiding or'e the Imagination, beholds all the Species depoſited in it ſelf, diſcerns and corrects

In man it is the Intellect preſiding or'e the Imagination.

corrects their obliquities or hypocriſies the Phantaſie there drawn forth ſublimes, and diveſting it from matter formes univerſal things from ſingulars; moreover, it frames out of theſe ſome other more ſublime Thoughts, not Competent for the Corporeal Soul: ſo it ſpeculates or Conſiders both the nature of every ſubſtance, and abſtracted from the Individuals of Accident, viz: Humanity, Ratiotinality, Temperance, Fortitude, Corporeity, Spirituallity, Whiteneſs, and the like; beſides, being carried higher, it Contemplates God, Angels, It ſelf, Infinity, Eternity, and many other notions, far remote from Senſe and Imagination. And ſo as our Intellect, in theſe kind of Metaphyſical Conceptions, makes things almoſt wholly naked of matter, or carrying it ſelf beyond every ſenſible Species, conſider or beholds them wholly immaterial, this argues certainly, that the Subſtance or Nature of the Rational Soul is Immaterial and Immortal: Becauſe, if this Aptneſs or Diſpoſition were Corporeal, as it can conceive nothing Incorporeal by Sence, it ſhould ſuſpect there were no ſuch thing in the World.

Which diſcerns the errors of this.

Sublimates its notions, & diveſts them from Matter.

Contemplates immaterial Subſtances.

Secondly, It appears clearly, from what was ſaid before, that Phantaſie, or the Knowing facultie of the Corporeal Soul, doth not only apprehend ſimple things, but alſo Compoſe or Divide many things at once, and from thence to make enuntiations: Becauſe living Brutes, in various objects together, which are for food, diſcern things Convenient from others Inconvenient or unfit; moreover, they chooſe out of theſe, things grateful before others leſs grateful, and get them ſometimes by Force, ſometimes by Cunning, and as it were by ſtealth. A Dog knows a Man at a great diſtance; if he be a Friend, he runs to him and fawns on him; If an Enemy and fearful, he barks at him or flies at him, but if armed or threatning him, he flyes away from him. Theſe kind of Propoſitions the Brutes eaſily conceive, for as much as ſome Species of the ſenſible thing being newly admitted, meets with Species of one thing or other before laid up in the memory, or being ſuggeſted by a Natural Inſtinct, aſſociates with them or repulſes them. But indeed, how little is this, in reſpect of the humane Intellect? which not only beholds all enunciations conceived by the phantaſie, but judges them, whether they be true or falſe, Congruous or Incongruous; orders and diſpoſes them into Series of Notions, accommodated to ſpeculation or practiſe: Moreover, it reſtrains the phantaſie it ſelf, being too inſtable and apt to wander through various phantaſies; it calls it away from theſe or thoſe Conceptions, and directs it to others, yea it keeps it within certain limits at its pleaſure, leſt it Should expatiate or divert too much from the thing propoſed: Which out of doubt is a ſign that there is a Superior Soul in Man, that moderates and governs all the faculties and Acts of the Corporeal. But the Intellect, not only eminently Contains every Virtue of the phantaſie; but from the Species perceived in it, deduces many other thoughts altogether unknown to the ſenſe, and which the Phantaſie of it ſelf could no way Imagine. For Beſides, that it conceives the formal notions of Corporeal things, abſtracted from all matter, and attributes to them prædicates meerly Intentional yea and underſtands axioms or firſt principles alone, and as it were by a proper Inſtinct, without recourſe to Corporeal Species; the humane mind alſo beholds it ſelf, by a reflected Action, it ſuppoſes it ſelf to think, and thence Knowing a proper exiſtency, not to be perceived neither by Senſe nor by Phantaſie; when in the mean time, neither Senſe nor Imagination (of which no Images are extant) do perceive it ſelf to know or imagine: Beſides theſe, the Rational Soul comprehends, as it were by its own proper light, God to be Infinite and Eternal, that he ought to be Worſhipped, that Angels or Spirits do inhabit the World, Heaven, and places beneath the Earth, that there are places of Beatitude, and Puniſhment, and many other notions meerly Spiritual, by no means to be learnt from Senſe or Phantaſie.

The Second Act of either Soul is Enunciation.

What and how ſlender this is in Brutes.

The rational judges, diſcerns, and directs the propoſitions of the Phantaſie.

It deduces from theſe others more ſublime thoughts.

It beholds it ſelf by a reflected Action.

And Contemplates other things remote from ſenſe, as God &c.

3. The perogatives of the Rational Soul, and the differences from the other Senſitive or Corporeal, may be yet further noted, by Comparing the Acts of Judgment and Diſcourſe, or Ratiocination, which it puts forth more perfectly, and often time demonſtratively, when theſe Kind of Acts, from this power in the Brutes, are drawn forth imperfectly, and only analogically, we have already declared the utmoſt that Brutes can do, and how far they can go towards the exerciſe of Reaſoning and Deliberation, through innate faculties, and acquired habits; which truly, if the whole be compared with the functions of the humane Intellect, and its Scientifick Habits, it will hardly ſeem greater than the drop of a Bucket, to the Sea. For to ſay nothing of that natural Logick, by which any one endoued with a free and perſpicacious mind, probably and ſometimes moſt certainly concludes, Concerning all doubtfull things, or things ſought after, if that we mind how much the humane mind being adorned by Learning, and having learnt the Sciences and liberal Arts, is able to work, uuderſtand, and ſearch out; it would be thought, tho in an Humane Body, to be rather living with Gods or Angels. For indeed here may be Conſidered, the whole *Encyclopædia* or Circle of Arts and Sciences, which (excepting

The Ratiocination of the Brute, what and how vile;

The humane Mind immenſly more excellent.

Is imbued with a natural Logick.

It hath Created all Arts & Sciences (except Theologie)

excepting Divinity) hath been the Product or Creature of the Humane Mind, and indeed argues the Workman if not divine, at leaſt to be a particle of Divine Breath, to wit, a Spiritual Subſtance, wonderfully Intelligent, Immaterial, and which therefore for the future is Immortal. It would be tedious here to rehearſe the Subtil Wiles of Logick, and the extremely curious web of Notions, or of the Reaſon of Eſſences, or Beings, where the things of Natural Philoſophy being unfolded by their Cauſes, are diſſected as it were to the Life; the moſt pleaſant Speculations, the profound Theorems or rather Celeſtial, of the *Metaphyſicks* or ſupernatural things; yea and the grand Myſteries of other learning firſt found out by humane Induſtry. But above the reſt, is it not truly amazing to ſee the moſt certain Demonſtrations of the Mathematicks, and therefore a-Kin and greatly alluding to the Humane Mind, its Problems and Riddles how difficult ſoever to be extricated, with no labour, yea and many things of it attained, and moſt glorious Inventions. What is it below a Prodigy, that *Algebra* from one Number or Dimenſion, which at firſt was uncertain and unknown, being placed, ſhould find out the quantity of another altogether unknown? What ſhall I ſay concerning the Proportions of a Circle, a Triangle, a Quadrangle, and other Figures, and of their Sides or Angles variouſly meaſurable among themſelves, being moſt exactly computed? what beſides, that the Humane Intellect having learnt the Precepts of *Geometrie* and *Aſtronomie*, takes the ſpaces of inacceſſible places, and their heights, the floor or breadth of any ſuperficies, and the contents of ſolids, yea the dimenſions of the whole Earthly Globe: meaſures exactly the ſpaces of hours and days, the times of the year, the Tropicks, by the progreſs only of a ſhadow? yea it meaſures the Orbs, Magnitudes, and Diſtances of the Sun and Starrs, for a long time to come, Calculates, and exactly Foretells, their riſings and ſettings, motions, declinations, and Aſpects one to another; we ſhould want time, ſhould we go about to enumerate the ſeveral portentous things, either of the practice or ſpeculation in the Mathematicks. Then, if paſſing over to Mechanical things, We ſhall conſider the ſeveral Works and Inventions of Workmen, and the artificial Smiths-Works wonderfully made, there will be no place for doubting, but that the humane Soul, which can ſo famouſly underſtand, invent, and find out, and effect, I had almoſt ſaid, Create things ſo ſtupendious, muſt needs be far above the Brutal, Immaterial and Immortal; eſpecially becauſe Living Brutes obtain only a few and more ſimple Notions and Intentions of Acting, yea and thoſe always of the ſame Kind, and not determinated but to one Thing, altogether ignorant of the Cauſes of things, and know not Rights or Laws of political Society: further, they make no Fires or Houſes, nor find out any mechanical Arts, they put not on cloaths, nor dreſs their food, yea unleſs taught by Imitation, they know not how to number Three. When therefore we have plainly detected in Man, beſides the Corporeal Soul, ſuch as is Common with Brutes, the prints of another ſuperiour, meerly ſpiritual, we ſhall next ſeek out by what bond, and by what neceſſitude, theſe twins are conjoyned, and intimately come together, in the ſame Body.

Logick.

Phyſick.

Metaphyſicks.

Mathematicks.

Algebra.

Admirable things of Geometry and Aſtronomy.

The humane Mind does wonders in mechanical Things.

In reſpect of Man, how little is it that the Soul of a Brute Can do?

Some of thoſe, who have ſhew'd the difference, between the Souls of the Brute and of Man, affirming the Irrational or Corporeal peculiar to them, would have the Rational Soul of Man, to perform not only the Offices of the Intellect and Diſcourſe, but alſo the other Offices of Senſe and Life, yea to do and adminiſter the whole Oeconomy of Nature: To which opinion (however it may have prevailed in our Schools) the opinions of moſt learned men of every Age has been clearly oppoſite. That I may not be tedious, in rehearſing of many, I ſhall cite only two Authors (but either of which is worth a Multitude) in the Confutation of this Aſſertion. One is, that famous Philoſopher, *Peter Gaſſendus*, who *Phyſic. Sect.* 3. *lib.* 9. *Cap.* 11. differencing the Mind of Man, as much as he could, from that other Senſitive Power of his, by many and very remarquable notes of diſcrimination, yea (as 'tis ſaid in the Schools) by Specifick Differences, he has (as they ſay) divided the whole Heaven between: Becauſe when he had ſhewed this to be Corporeal, Extenſive, and alſo Naſcible or that may be born, and Corruptible, he ſaith that the other was an Incorporeal Subſtance, and therefore Immortal, which is Created mediately by God, and infuſed into the Body; which opinion he ſhews *Pythagoras*, *Plato*, *Ariſtotle*, and many ancient Philoſophers, beſides *Epicurus*, very much to have favoured; excepting however, that they, for as much as they not knowing the beginning of the Soul they judged Immortal, affirmed it, taken from the Soul of the world, to ſlide into the humane Body, and it to be refunded again either immediately into that Soul of the World, or mediately at length, after a Tranſmigration thorow other Bodies. The other ſuffrage concerning this matter is, of the moſt Learned Divine, our *Dr Hammond*, who unfolding that Text of St *Paul* to the *Theſſalonians*, 1 chap. 5. v. 23. *The whole Body Soul and Spirit*: ſays, that man is divided into three parts, to wit, Firſt into the body, which is the Fleſh and Members: Secondly

That there are two diſtinct Souls in Man beſides many other of later Time there are for Authors

Gaſſendus

And Hammond.

Secondly, Into an Animal Life, which also being Animal and Sensitive, is common to Man with the Brutes; And Thirdly, into Spirit, by which is signified the rational Soul, at first Created by God, which being also Immortal, returns to God, *Lib. Annot.* on the New Testament, p. 711. He Confirms this his Exposition, by Testimonies taken from Ethnick Authors, also from the Fathers. And truly it is most evidently plain, from what hath been said, That Man is made, as it were an Amphibious Animal, or of a middle Nature and Order, between Angels and Brutes, and doth Communicate with both, with these by the Corporeal Soul, from the Vital Blood, and heap of Animal Spirits; and with those by an intelligent, immaterial, and immortal Soul. And indeed, Reason persuades us plainly that 'tis so, to wit, for as much as we find in our selves, as by and by shall be more fully shown, the Strifes and Dissentions of one Soul with another, sometimes this, and sometimes that getting the Rule, or being in Subjection. But as it is said, That the Rational Soul doth exercise of it self all the Animal Faculties, is most improbable; because the Acts and Passions of all the Senses, and Animal Motions are Corporeal, being divided and extended to various Parts; to the performing which immediately, the incorporeal and indivisible Soul seems unable, so that it would be finite. Then as to what respects that Vulgar Opinion, that *the Sensitive Soul is subordinate to the Rational, and is as it were swallow'd up of it*, as that which in Brutes is the Soul, is mere Power in Man; these are trifles of the Schools. For how should the Senfitive Soul of Man, which subsisting at first in Act, was material and extended, foregoing its Essence at the coming of the Rational Soul, degenerate into a mere Quality? if that it should be asserted, That the Rational Soul by its coming, doth introduce also Life and Sensation, then Man doth not generate an animated Man, but only an inform Body, or a rude lump of Flesh.

This also Reason dictates.

The Rational Soul does not exercise the Animal Faculties.

Obliterates not the Senfitive Soul by its Coming.

Nor transmutes it into a mere Power.

Therefore, supposing that the Rational Soul, doth come to the Body first animated by another Corporeal Soul, we shall inquire, by what Bond or Knitting, since it is pure Spirit, it can be united to it, for as much as it hath not Parts, by which it might be gathered to, or cohere with this whole, or any of its Parts. Concerning this, I think we may say, with the most Learned *Gassendus*, That the *Corporeal Soul is the immediate Subject of the Rational Soul, of which, as she is the Act, Perfection, Complement, and Form by her self, the Rational Soul also effects the Form, and Acts of the humane Body.* But for as much, as it seems not equal nor necessary, that the whole Corporeal Soul, should be employed by the whole Rational; therefore we may affirm, this purely Spiritual, to sit as in its Throne, in the principal Part or Faculty of it, to wit, in the Imagination, made out of an handful of Animal Spirits, most highly subtil, and seated in the Middle or Marrowie part of the Brain: Because, when as the Species, or every sensible Impression, of which we are any ways Knowing, being inflicted any where on the Humane Body, is carried to the Imagination or Phantasie, and there all the Appetites or Spontaneous Conceptions, or Intentions of things to be done, are excited, the Intellect of Humane Mind, presiding in this Imperial seat, easily performs the Government of the whole Man. For (as *Gassendus* properly has it) *As there is no necessity for a King, to be in his whole Kingdom, but only in his Palace, to which place, are carried whatever happens in the Kingdom; so the Phantasie is the Kingly Palace of the Intellect, to which may be brought whatsoever are acted Spontaneously and to our Knowledge, in the whole Body.* But as to what has relation to the Functions merely Natural, which being done by a constant manner of Oeconomy, as it were by a Law from the Creator, are performed unknown to the Animal, it were not fit, that the Imagination, much less the Intellect, should attend on these lower Offices: altho also, the faults of these, as often as they are amiss, lying hid to the Imagination, the Intellect most often finds them out, and procures them to be amended. As to the Mode of the Intellect, by which the Phantasms of all sensible Things being drawn in the Imagination, is beheld, it may be said, That this is done not by percussion from the Corporeal Species, (for this is repugnant to the Corporeal Faculty) but by an Intuition into it self, expressed in the Phantasie. But as the Rational Soul, will stay and preside in the Court of the Phantasie, there is no need that she should be shut out from thence, or bound by any Bond; because destinated to this by the most high Creator, to wit, that it should be *the informing Form of Man*; and also her self is very much inclined, to the Inhabiting this House; because, whil'st in the Body, it depends very much, as to its Operation, on the Phantasie, without the help of which, it can know or understand nothing. For it draws its first Species and fundamental Idea's, by which it rears all its manner of Knowledge, from the Imagination; wherefore, that the Mind of one Man understands more, and reasoneth better, than that of another, it does not thence follow, that Rational Souls are inequal, but every disparity, concerning the Intellect, proceeds immediately from the Phantasie, but mediately and principally from the Brain, being variously disposed. For as this being affected, by an

By what Bond the Rational Soul is united to the Body.

That the Corporeal Soul is the Subject of the Rational. Gass. Physic. Sect. 3. Memb. Post l. 9. c. 11.

Gassend. Ibid.

The Seat or Palace of the Humane Mind, is in the Phantasie.

The manner by which the Phantasms are beheld by the Intellect, viz. Intuition, not Percussion.

The Rational Soul is inclined to the Body.

The Intellect depends upon the Phantasie.

By reason of the various Constitution of this, and the Brain, Souls seem unequal.

Intemperate or Evil Conformation, the Spirits being made more dull, or hindred, cannot irradiate and actuate in their due manner; therefore the Phantasms are difficient or distorted, and the Faults or Vices of these infects the Intellect. Hence it very often happens, by reason of some hurt coming to the Brain, that the Faculties or Habits, or Ratiocination or Reasoning, howsoever strong, are diminished or taken away: Because, as the most Skilful *Gassendus* tell us, That *the acquisition and loss of an habit, stands in the Power of the Brain and Phantasie, a subject purely Corporeal; but that the Intellect, as it wants Parts, cannot be wrought upon by Parts, but that it is from the beginning, and of its own Nature, a full and perfect power of understanding; which understands, not more by the coming of any Habit, but is rather it self an Habit, always ready to understand:* wherefore he says, that Aristotle *has hit the mark, when he says, that his Agent having its Intellect, as it were a Light, had it therefore as it were a certain Habit: to wit, when this Intellect, as it were a Light, is ever ready to illustrate; therefore it would have it self like to an Habit, in a Workman or Artist, to whom, when you give an Organ or Instrument, as an Harp to an Harper, he is presently ready to Play*; by which it comes to pass, as he says, *the Intellect also to come under such a Reason, like as Art comes under Reason, as to Matter*: So we may say, *As an Harper has in himself the Skill of Playing on the Harp, and if he shews not his Art, there is a defect, not of himself, but by reason of the absence or the depraved disposition of the Harp; after the same manner, the Intellect is abundantly Instructed, in its own Nature, that it understands, and uses Phantasies, and if it may not do it, the cause is not in it self, but is either in the absence of the Phantasms, or their Imperfection.* For indeed, as the same Author afterwards adds, *The chief Function of the Humane Intellect seems to be like that of the Angels, that it is of its own Nature, merely Intelligent, that is, Knowing things by a simple Sight, not by Ratiocination; But that darkness is poured on it dwelling in the Body, that it doth not perceive all that it understands, simply, nakedly, and as it were through the means of Intuition; but attains it very much by reasoning, that is, successively, and proceeding as it were by degrees.*

How the Habits of Reasoning are acquired and performed.

Gassendus, Ib.

From these we may probably Conclude, or at least Conjecture, after what manner the Rational Soul remains in the other Corporeal, and using as it were its Eyes, and other Powers, understands; yea, and this mediating or coming between, she is said to be united to the Body, and to be its informing Form. As to the first yoaking of the one Soul with the other, thô the Rational Soul it self, and this, is altogether ignorant of its Birth, we may affirm notwithstanding, what is Consonant to Holy Faith, right Reason, and to the Authority of Divines, who were of the chiefest note; That this immaterial Soul, for as much as it cannot be born, as soon as all things are rightly disposed for its Reception, in the Humane formation of the Child in the Womb, it is Created immediately of God, and poured into it.

That the Rational Soul is Created and poured inio the formed Body.

Not propagated Ex tradúce.

But that some have said, That the Rational Soul is propagated *Ex traduce* or of its Kind, for as much as oftentimes the Son, in respect of Wit, Temperament, Ingenuity, the Affections, and other Animal Faculties, is exactly like the Father, it follows not; because these Gifts and Offices proceed immediately from the Corporeal Soul, which we grant to be begotten by the Father, together with the Body, but not the Rational Soul. In what State this at last exists, being freed from the Body, and what Kind of Understanding and Knowledge it enjoys, is not easie to be determined; but since we shall be like the Angels, we may think, that the separated Soul doth see all Objects with a Simple sight, and by no Corporeal Species, and wants no Ratiocination, for the discovering any thing lying hid in them. But this Speculation being let alone, as too airy, we shall further Consider, other Gestures and Manners of the Rational Soul, whil'st it lives in the Body; and as hitherto we have seen the Marrying together of it, with the Corporeal Soul, and the mutual Commerces and Friendships as to the Knowing Faculties of either, we will now consider the Disputes and Wranglings of these, which in respect of their Powers, often happen: because the Intellect and Imagination, do not agree in so many things; but that it, and the Sensitive appetite, are wont to disagree in more: from which Strifes may further be argued, the distinct means of the aforesaid Souls, both as to their subsisting and working.

Separate States.

A Plurality of Souls in Man, is manifest by their differences.

3. As there is said to be in Man a twofold Knowing Power, *viz.* The Intellect and the Imagination, so it is commonly affirmed, that there is a twofold Appetite, *viz.* The Will, which proceeding from the Intellect, is the Handmaid of the Rational Soul; and the Sensitive Appetite, which cleaving to the Imagination, is the Hand or Procures of the Corporeal Soul. Which Opinion, thô it be founded on the Sayings of the Ancient Philosophers; for that by *Plato* and *Aristotle*, The *Will is attributed to the Rational Part, and to the Irrational Lust and Wrath*; yet it ought not to be so taken, as if the Rational Soul, for that it is immaterial, and therefore esteemed without Affection, should be obnoxious to the Affections of desires or aversations, from every shaking approach of Good or Evil,

In Man a twofold Knowing Power, and a twofold Appetite.

Evil, of that being turbulent; for this indeed is repugnant to its incorporeal Nature, and to its Dignity and Prerogative above other Powers. Without doubt, in the Contemplation of Truth and Goodneſs, and eſpecially of that which is the ſum of either, in the doing of good Works, in the Knowledge of things by their Cauſes, and in the Exerciſes of Habits, both Scientifick and Practical, great Complacency happens to this; and on the contrary a certain diſpleaſure for the want of theſe. Moreover, the Love of God, of Virtue, and of all that is good, and the deteſtation of Vices, and of wicked Men; yea, and other pure Affections, and ſuch as are Simple, coming without perturbation or trouble, belong to the Rational Soul: In the mean time, *That ſhe* (according to *Plato*) *like the top of* Olympus, *might enjoy a perpetual Serenity, hath the whole heap of Perturbations below it ſelf, and in the irrational part, placed like Clouds, Winds, and Thunder, in an inferior Region, and under its feet.* And truly, all the vehement Affections or Perturbations of the Mind, by which it is wont to be moved, and inclined hither and thither, for the Proſecuting the Good, or ſhunning Evil, belong wholly to the Corporeal Soul, and are ſeen to obtain the ſame ſeat with the Phantaſie, within the middle or marrowy part of the Brain: (by what means the Paſſions alſo affect the *Præcordia* by conſent, ſhall be declared afterwards) in the mean time, the Intellect, even as it beholds all the Phantaſms, and Orders and Rules them at its pleaſure; ſo it not only perceives, but whil'ſt it is its ſelf, governs and moderates, all Concupiſcences, and Floods of Paſſions, that are wont to be moved alſo within the Phantaſie; and ſo, as it approves theſe Affections, and rejects thoſe, now excites others, now quiets them, or directs them to their right ends, the Rational Soul it ſelf is ſaid to exerciſe certain Acts of the Will or Power, by theſe kind of Dictates of hers, and that ſhe her ſelf wills or wills not, the ſame thing, which by her Permiſſion or Command, the Senſitive Appetite deſires or hates.

The Rational Soul of it ſelf without Affections; how it governs and orders the Phantaſie and Affections.

But the Corporeal Soul does not ſo eaſily obey the Rational in all things, not ſo in things to be deſired, as in things to be known: for indeed, ſhe being nearer to the Body, and ſo bearing a more intimate Kindneſs or Affinity towards the Fleſh, is tied wholly to look to its Profit and Conſervation: to the Sedulous Care of which Office, it is very much allured, by various Complacences, exhibited through the Objects of every Senſe: Hence ſhe being buſied about the Care of the Body, and apt by that pretext, its natural Inclination, and indulging Pleaſures, moſt often grows deaf to Reaſon, perſwading the contrary. Further, the lower Soul, growing weary of the yoak of the Other, if occaſion ſerves, frees it ſelf from its Bonds, affecting a Licenſe or Dominion; and then there may plainly be ſeen the Twinns ſtriving in the ſame Womb, or rather a Man clearly diſtracted or drawn ſeveral ways, by a double Army planted within himſelf; to wit,

In things to be Known, the Corporeal Soul obeys the Rational, but not in things to be done.

The Corporeal Soul inclining her ſelf to the Fleſh,

—Where Enſigns Enſigns meet,
And where with Arms, they one another threat;

Fights againſt the Rational.

This Kind of Inteſtine Strife, does not truly ceaſe, till this or that Champion becoming Superior, leads the other away clearly Captive. Altho in the mean time, to the Eſtabliſhing the Empire of the Rational Soul, alſo for the Vindicating of its Right and Principality, from the Uſurpation of the Senſitive Soul, the Precepts of Philoſophers, and Moral Inſtitutes are framed; and when theſe can do little, Sacred Religion gives far more potent helps, whoſe Laws and Precepts being rightly obſerved, are able to carry Man, not only beyond the Brutes, but himſelf, to wit, above his Natural State; for as much as they ſubject the Senſitive Soul to the Rational, and both to the moſt high God. But yet, ſuch a Divine Politie is not erected in Man, without great Contention: Becauſe, whil'ſt Reaſon uſing its proper force, and alſo Inſtitutes and Sacred Ethicks, endeavours to draw the Faculties of the Corporeal Soul to its Party, ſhe riſing againſt it, adheres pertinaciouſly to the Fleſh, and is hardly pull'd away from its Blandiſhments; yea, what is to be lamented, it ſeduces in us the Mind or Chief Soul, and ſnatches it away with it ſelf, to role in the Mud of Senſual Pleaſures: So that Man becomes like the Beaſt, or rather worſe; to wit, for as much as Reaſon becoming Brutal, leads to all manner of Exceſs. But indeed, 'tis not always ſo with the Empire of the Mind, but that ſhe returning at length, ſometimes on her own accord, or awakened by ſome occaſion, and knowing of its fall, ariſes up againſt the Senſitive Soul, as againſt an Enemy or Traitor, caſting her out of her Throne, commands her to Servitude; yea, ſometimes by reaſon of ſome wickedneſs committed, it compels it to torment it ſelf, and its Lover the Fleſh, and ſo to expiate as much as it may, its faults, by inflicting on it proper Puniſhments. Indeed, theſe kind of Acts and Affections of Conſcience, near to Man, plainly ſhews, that there is in him either two Souls ſubordinately, or at leaſt the Parts of the ſame are far different; to wit, when one of which oppoſes the other, and either ſtrives for the obtaining of Proſelytes, it happens that Man is hurried into contrary Endeavours, and is acted little leſs than like a Dæmoniack poſſeſs'd with a Legion. But having

How it is reduced to Obedience.

It often ſeduces the Mind.

Wars are made between them.

Affections of Conſcience nigh to Man.

having propoſed theſe things, concerning the Rational Soul, (which we have touch'd only by the by, as beſides our purpoſe) we will return to the Corporeal, and as we have illuſtrated its Eſſence, Hypoſtaſis, and Integral Parts, we ſhall now deſcend to the Explaining of its Affections, or Paſſions.

But in the mean time, as we have ſhewn, by comparing the Corporeal Soul of the Brute, with the Rational of Man, what vaſt difference there is between them, perhaps it might be to the purpoſe, to compare the Brains of either, and to obſerve their differences. But this Anatomy being elſewhere made, we have noted little or no difference, in the Head of either, as to the Figures and Exterior Conformations of the Parts, the Bulk only excepted; that from hence we concluded, the Soul Common to Man with the Brutes, to be only Corporeal, and immediately to uſe theſe Organs. But as we have ſhewn the deſcription of a Sheeps Brain, diſſected within the *Cortex*, and as it were made bare of Fleſh, whereby all the Interior Parts might appear, we ſhall here alſo, to Crown the work, give you the Figure of an Humane Brain; ſo as all the inward Parts may be laid open.

The Eighth Table,

Contains a new Anatomy of the Humane Brain, where, by a Diſſection with an Inſtrument made thorow the Bill, the Callous Body, and the Fornix or Arch, and their Parts being taken away and ſeparated; the ſtreaked Bodies, alſo the Optic and Orbicular Prominences, one ſide eraſed, and the other whole and plain, are Exhibited.

A. A. A. A. *The Hemiſphear of the Brain divided and ſeparated by themſelves.*

B. B. B. B. *Portions of the Callous Body with the Fornix cut off, and removed apart.*

C. *The Baſis of the Fornix, with its Roots, which cohered with its Trunk* Y. Y; *divided Portions of which, with Cuttings off of the Callous Body, are laid apart on the right and left hand.*

D. *One ſtreaked Body ſcraped or Eraſed, that the Medullary ſtreaks or nervous Tracts may appear.*

E. *The formoſt border of this Body, ſticking to the right Hemiſphear of the Callous Body.*

F. G. *The Baſis and the Cone, of the ſame Body.*

H. *The hinder Border of the ſame, in which the Optick ſtreaks, yea and other Medullary Proceſſes, are ſent from the Orbicular Prominences.*

I. *The ſtreaked Body of the left-ſide plain, with the Veſſels creeping thorow them; whoſe Borders and Ends are made after the ſame as in the right.*

K. *The right Optick Chamber eraſed, whoſe Medullary ſtreaks, being ſtrait and thick ſet,* K. K. *are ſtretch'd forth, into the Border of the ſtreaked Body.*

L. *The right Nati-form Prominence in like manner eraſed, with ſtreaks ſtretched forth into the Medullary Proceſs* M.

M. *The Medullary Proceſs, which proceeding from the Teſtes, and compaſſing about the Nates, ſends from thence other Medullary paſſages into the ſtreaked Body, as more plainly appears in the left ſide being whole.*

N. *The Pineal Kirnel in its proper place.*

O. O. *The Orbicular Prominences called Teſtes, Marrowy thorow the whole.*

P. *The left Nati-form Prominence plain and whole, which is ſmaller in Man, and for the moſt part Marrowy.*

Q. *A Medullary Proceſs, Compaſſing the Nates, from which is ſent one Medullary Pipe or paſſage* R. *towards the Cone of the ſtreaked Body, and another* S. *towards its Baſis; of which by and by a forked branch goes forth, one* r. *to the middle of the ſtreaked Body, the other* s. *to the corner of its Baſis.*

T. *A Tranſvers ſhoot knitting together the aforeſaid Branches.*

V. *The hinder Borders of the ſtreaked Bodies, joyned together among themſelves.*

W. *The Gap or Chink leading to the Tunell.*

X. *The Gap or Chink, leading into the Cavity, lying under the Orbicular Prominences.*

Y. *A Medullary Proceſs, leading from the Oblong Marrow, into the Cerebel, which ſeems to be the root of this.*

Z. Z. *Separated Portions of the Cerebel cut off, that its Tracts both Marrowy, and Cortical or Barkie, may be ſeen.*

&. *The Cavity or hollowneſs lying under the Cerebel.*

CHAP. VIII.

Of the Paſsions or Affections of the Corporeal Soul in General.

THe whole Corporeal Soul, ſo long as ſhe is quiet and undiſturbed, ſhe is fittted to her proper Body equally, as to a certain Cheſt or Cabbinet, and waters all its Parts gently, both with little Rivulets of Blood Circulating, and actuates and inſpires them every where with a gentle falling down of the Animal Spirits; But it ſometimes happens, that the whole Conſtitution of this ſame Soul, is ſo ſhaken and moved, that both the Blood being interrupted in its equal Circule, is compelled into irregular Excurſions, and Recurſions, and various Fluctuations; and alſo, that the Animal Spirits being ſnatched hither and thither, inordinately perform the Acts of their Functions: yea, the Animal Spirits themſelves, whil'ſt being moved irregularly, do ſhake the *Præcordia*, and flow into them in an undue manner, cauſe the Courſe of the Blood more to be perverted. Further, from the Corporeal Soul being diſturbed, not only the Animal Spirits, and Rivers of the Blood, are driven into diſorders, but they induce alterations both to the other Humors, and to very many Parts and Members of the Body, and to the Rational Soul it ſelf, in Man. As there are manifold Examples of theſe kind of Perturbations, by which, the Corporeal Soul being too much ſwell'd up, or Contracted, or otherways diſtorted, it becomes as it were unequal, and not Conformable to the Body, the Chief of them may be referred to theſe two Heads. To wit, Firſt, Sometimes this Soul, as it were leaping forth, erects and ſtretches out it ſelf beyond meaſure, and ſo dilating its *Hypoſtaſis*, deſires to reach it ſelf beyond the bound of the Body: Hence the Animal Spirits, being reſpectively moved, in the Brain, enlarge the Sphear of their Irradiation, and as they ſo ſhake the *Præcordia*, by a more full inflowing, they Compel the Blood therefore to be ſnatched together, and to be poured forth more freely into all the Parts. Secondly, Sometimes on the contrary, this Soul being ſtruck, is more narrowly Compreſſed within it ſelf; ſo that being drawn inwardly, and ſinking down within its wonted Compaſs of Emanation, becomes leſs than the Body; wherefore, the Animal Faculties wonderfully flagg, and their Acts are either ſluggiſhly or perverſly performed: Moreover, the *Præcordia* alſo being deſtitute of their due influx of Spirits, almoſt ſink down, and ſuffer the Blood to ſtay too long there, and to ſtagnate oftentimes. There are beſides ſome other Geſtures of the aforeſaid Soul, by which the ſame departing from its equal Expanſion, becomes not Congruous to the Body; and in theſe kind of Caſes, chiefly the Senſitive Power, according to the received Impreſſions, affects a new Species, and brings the Brain and Imagination into its Party: Then by and by, by the paſſage of the Nerves, it affects the *Præcordia*, as it were with a certain ſtroke, and determinates them after her meaſure; ſo that according to the Idea received from the Imagination, the Motion of the Blood is Compoſed, as it were after the meaſures of a Dance: we ſhall add anon Inſtances and Examples of theſe, when we ſhall treat of the Paſſions particularly.

A Twofold ſtate of the Corporeal Soul: Tranquil or Quiet,

And Diſturbed.

In which either part of the Soul is moved.

And is either too much inlarged,

Or Contracted.

The Trouble of the Soul, impreſſed on the Senſitive Part, by and by is Communicated to the Blood.

In the mean time, that we may inquire into the Cauſes of the Paſſions in general, it plainly appears from what hath been ſaid, that the Corporeal Soul is found under a twofold ſtate, to wit, either of Quiet or Commotion: That ſhe is like a Calm Sea, with a ſmooth Superficies, and ſquared altogether gentle and ſerene; or ſhe becomes troubled, like water ſhaken into various Circles, and wavings by the blaſts of the Winds, or by ſome ſolid things caſt into it. The former ſtate of the Soul is perceived, not only in Sleep, when the Spirits are bound up, or lye quiet of themſelves; but often in Waking, to wit, as often as objects or ſenſible things, being brought from without, or imaginary things conceived within, do import nothing of Good or Evil to us, and that we only know and apprehend them: for ſo, without any Trouble or Moleſtation, they pleaſantly ſlide into the common Senſory and Imagination, and thence quickly paſs away; but if the object is offer'd under the Species of Good or Evil, preſently the Senſitive Soul prepares for the embracing or the avoiding it; and not only procures to its Endeavors the Animal Spirits, but alſo the Blood and Humors; yea, draws the ſolid Parts to help her. For as ſoon as the Imagination conceives any thing that is to be embraced or ſhuned, preſently the Appetite is formed by the Spirits inhabiting the Brain, ordered into a Series; then by an impreſſion ſent to the *Præcordia*, as they are either dilated or contracted, the Blood is carried into various Motions of Fluctuations, and then by an inſtinct of the Appetite tranſmitted to the proper Nerves, the reſpective Motions are drawn forth: And upon theſe kind of Furnitures and Affection of the Spirits and Humors, and of the ſolid

The quiet of the Soul happens not only in ſleep, but often waking, when pleaſing or unhurtful things are met with.

On the contrary when from the Objects, Good or Evil is promiſed:

Then firſt the Imagination afterwards the Appetite is moved.

ſolid Parts, the Affections or Paſſions of the Mind wholly depend, we have elſewhere ſhewed, after what manner, and by what Trajection or Irradiation of the Spirits, within the Nervous Proceſſes, ſuch quick Commerces are made, between the Brain and the *Præcordia*, and between both theſe and other Motive Parts.

But that we may yet more fully deſcribe the Affections or Paſſions of the Corporeal Soul, as they are chiefly to be found in Man, it is here to be noted, That not every Species or Appearance of Good or Evil, does excite theſe Commotions of the Soul: becauſe we behold undiſturbed the proſperous or adverſe things of others, not related to us: But further, 'tis requiſite that the Goodneſs or the Malice of the Object belongs properly to a Man, altho what happens to our Friends or Relations, is as if it happened to our ſelves.

The Reaſon of Good and of Evil, either concerns, The Corporeal Soul by it ſelf. Or her united to the Body, Or her ſubjected to the Rational Soul.

Alſo beſides, Good and Evil happen to the ſame Man after various ways, and under a diverſe reaſon, both in reſpect of the Object, and alſo in reſpect of the Subject. Concerning the former we ſhall ſpeak anon: As to the other, Good or Evil being brought to Man, either reſpect the Corporeal Soul by it ſelf, and as it were abſtracted from any other Relation; or they reſpect her as conjoyned to the Body, and intimately dear to her: Or laſtly, they reſpect her, as ſubdued by the Rational Soul; ſo indeed, altho the Affection is continually poured into the Corporeal Soul, yet it reſpects Good or Evil, either of this, or that, or of another Subject, and is excited for the ſake of that: And according to this threefold Relation of the Senſitive Soul, the Paſſions by which ſhe is affected, are called either Phyſical, or Metaphyſical, or Corporeal or Moral; we ſhall diſcourſe ſingly, and a little more plainly of theſe.

Hence Paſſions are called either Phyſical, Metaphyſical, or Corporeal.

Paſſions merely Phyſical, are Sympathies and Antipathies.

Firſt, Therefore, as to the Paſſions merely Phyſical, we ſay, That the *Sympathies* and *Antipathies* of a diverſe Kind, which are as it were proper and intimate Affections, ſeem to belong to the Corporeal Soul by it ſelf, and abſtracted from all Relation: Beſides, the highly attractive Species of Beauty and Fairneſs, by the ſight of which this Soul is wont to be inſnared, moſt certainly; ſo that neglecting the Care of the Body, and laying aſide the dictates of Reaſon, cleaves moſt cloſely to her Lover: Alſo ſometimes leſs fair things which every whole Man would forſake, ſnatches this Soul, drawn as it were by Witchcraft, and leads it Captive; as indeed, loſt Lovers, though they ſee better things and approve them, yet follow the worſe; the reaſon of which is, that the Senſitive Soul enters into Friendſhips, of which the Affections are not knowing, with certain things in Secret, and inſeparably and firmly loves them. Concerning *Antipathies* we meet with many things to be admired, as ſome ſenſible Objects, innocent of themſelves, yea and grateful enough to many Men, and ſought with delight, become moſt horrid to ſome others, and more Killing than the Head of *Meduſa* at the ſight only: So ſome abhor the preſence of a Cat, others an Eel, or Toad, and others this or that Diſh of meat made ready. Nor do they only fly things by the ſight, but alſo received by the ſmell, yea, when they lye hid, and are not at all ſuſpected, they ſuffer Swounings and Fainting of their Spirits, by their ſecret Influence: Theſe Kind of Affections without doubt, proceed from occult Enmities of the Senſitive Soul; for when it happens this *Syſtaſis* or Diſpoſition of the Animal Spirits, by the meeting of ſome Object, to be driven into Confuſion, it ever after that abhors the coming of the ſame, or its Contact by its Effluvia's.

Some Inſtances of Paſſions merely Phyſical.

Paſſions Metaphyſical.

Secondly, Sometimes the Senſitive Soul receives the Superior Rational Paſſions, which we call *Metaphyſical*; and ſolicitouſly buſying it ſelf concerning their Good and Evil, it either draws forth or ſhortens the Compaſs of its Expanſion. For indeed, the Rational Soul relying on the help and familiarity of the Spirits dwelling in the Brain, aſpires to Metaphyſical Notions, which having more fully learnt, it not only falls upon higher Speculations, but alſo exerts a certain Superior Appetite, to wit, the Will, and implicates it with certain Affections, as it were inſpired of God; the exerciſe of which ſort of Sacred Affections are not performed by the mere Conceptions of the Mind: But their Acts being delivered from the Rational Soul into the Senſitive, do firſt employ the Brain with the Phantaſie, then being tranſmitted from the Brain into the Breaſt, there, for that they produce in the Heart and Blood variety of Motions, receive their Complement or Perfection: Wherefore, in the Worſhip of God, Piety and Devotion are attributed very much to the Heart: Hence Repentance, the Love of God, and Hate of Sin, Hope of Salvation, Fear of Divine Vengeance, and many other acts of Religion, are wont to be aſcribed to the work and endeavour of the Heart. The reaſon of which ſeems to be, for as much as the whole Corporeal Soul is Commanded by the Rational Power, that in Adoring God, ſhe ſhould very much bow her ſelf before the Deity, and as it were lye proſtrate on the Ground; therefore, preſently both Parts of it, *viz.* both the Senſitive and Flamy, do repreſs themſelves, and reſtrain their wonted Emanations; hence plenty of Animal Spirits being drawn from the Phantaſie, for the more full actuating the Organs of the Senſes, they beſtow the Operations of the Nerves on the *Præcordia*, which

By theſe firſt the Rational Soul.

Then the Senſitive and Sanguineous part of the other are affected.

which whil'ſt they are more ſtraitly drawn together, and as it were conſtrain'd, cauſe the Blood to ſtay longer within the boſomes of the Heart; and ſo inhibit it, leſt it ſhould be too much inkindled within the Lungs, and leſt being inkindled by the Heart, in the whole Body, and chiefly ſhould be carried rapidly into the Brain. For indeed, the Blood containing Life as a moſt precious Jewel in it ſelf, is not only heaped up more plentifully about the *Præcordia*, in all Fear and Danger, and is there lay'd up as it were for defence ſake, that it might better preſerve its Flame: But further, in devout Affections, whil'ſt the Rational Soul orders the Spirits inhabiting the Brain into ſacred Conceptions and Notions; by the Influence of the ſame Spirits, the Boſomes of the Heart are alſo ſo affected, that they cauſe the Blood to Centre, and to be more fully drawn into them, and there longer retain it, as it were an *Holocauſt* to be offered to God: ſo as often as we Pray moſt earneſtly, we endeavour nothing leſs, than that our Life with the Blood, be laid upon the Altar of the Heart. For truely, almoſt every body experiences in himſelf that in ſtrong Prayer, the Blood is more and more heaped up in the Boſomes of the ſwelling Heart: wherefore, that the Vacuities of the Lungs might be ſupplied, we breath deeply, and ſo the Air being more fully drawn in, the Muſcles of the Breaſt, and the *Diaphragma*, are detained almoſt in a continual *Syſtole*, or more often iterated; to wit, for this end, that the Vital Blood, to be offered as it were a Sacrifice to God, ſhould be there kept, nor ſuffer'd to go from thence, or to be inlarged, till as it were by a long immolation, together with Prayers, lieve may be had from the Godhead. Yea, 'tis to be obſerved, that thoſe religiouſly affected, are apt at all times to call back the Blood towards the *Præcordia*, and to repreſs it from a more plentiful Excurſion, which may give a looſe to Delights or Mirth: Becauſe 'tis juſt, that this Vital Humor ſhould be Conſerved, even Holy and Pure for God; and as it is ſo reſtrained in the *Præcordia*, leſt it ſhould grow too luxurious, nor be carried towards the Brain with too impetuous a Rapture, the Conceptions alſo of the Mind, without much heat and diſtraction of thoughts concerning Divine things: Hence it is, that Drinking of Wine, Banquetting, and every Kind of Diſſolute Life, becauſe they render the Blood lawleſs, and not able to be reſtrain'd or bridl'd, are ſaid to make hard the Heart, and to obſtruct the Duties of Religion. Further, not only the devout Acts of Religion, and Pious Affections, are attributed to the Breaſt and *Præcordia*; but alſo the ſober Counſels of Wiſe men, yea, and the Exerciſes of Virtues and Moral Habits, are ordinarily aſcribed by Philoſophers to this Seat or Subject: Hence Wiſe men are ſaid to be *Cordati*, Hearty, or ſage of Heart; but when one that is unwiſe or plainly fooliſh, doth a thing, it is ſaid, That there is nothing leaps in the left part of his Breaſt: The reaſon of which ſeems to be, that when as the Animal Spirits (which are the immediate Inſtruments of thoughts) are procreated altogether from the Blood, not only their more excellent diſpoſition, but their right and timely Diſpenſation, depends chiefly on the *Præcordia*. For to theſe are owing, that the Blood be inkindled in its due manner, and alſo Eventilated, that it may give to the Brain firm and ſtable Animal Spirits, which however Subtil and Active, yet may not be volatile beyond meaſure; and hence the Solidity of the Mind, and the ſharpneſs of Judgment are produced: When on the contrary, by reaſon of the Blood more ſlowly paſſing thorow the *Præcordia*, or more ſwiftly than it ſhould do, the Animal Spirits become too fixed, or volatile above meaſure, and therefore either a ſtupidity or lightneſs of Mind ariſes. But in truth, Wiſdom is much rather aſcribed to the Heart, for as much as from thence reins are put upon the Blood, apt for fierceneſſes and Impetuoſities, leſt that ruſhing into the Brain, with an inordinate rapture, ſhould not only diſturb its ſerious Cogitations, but ſtir up enormous Motions of the Appetite, and mad Luſts. For truely, whil'ſt the Spirits inhabiting the Brain, are diſpoſed by the Intellect, from thence preſiding within the Imagination, into Series and Orders of Notions, the Blood about to break forth from the Heart, ought very much to be reſtrained, leſt that growing luxurious, it ſhould confound all things by an importune evaſion of the Brain, and ſhould agitate the Spirits, called away from this work into Commotions, and various Fluctuations; wherefore, from the immoderate drinking of Wine, for as much as by it the Blood is made more head-ſtrong, and will not be repreſſed or contained by the Heart, Men become not only unable for Exerciſing the Acts of Judgment and Reaſon; but are found very prone to all manner of Wickedneſs and moſt filthy Deſires.

Wherefore, and how the Præcordia *are eſteemed the ſeat of Holy Affections.*

What it is to have the Heart hardened.

Wherefore the Præcordia *are called alſo the ſeat of Prudence and Wiſdom.*

As to the Moral Paſſions, or by us called Corporeal, we may obſerve, that the Senſitive Soul is more often and eaſilyer affected, by reaſon of Good or Evil, which is of its Subject, that is of its Body, which includes its good Habit. Altho alſo, ſhe hath her proper and occult Loves and Averſations, and is bound to ſhew due obſequiouſneſs to the Rational Soul; for as much as it is united to the Body, as it were by a Conjugal Compact; therefore, all other relations being lay'd aſide, it minds only this; Concerning the Care of it 'tis moſtly ſolicitous, and by reaſon of its proſperous or adverſe Affairs,

Three Corporeal or Moral Paſſions.

Affairs, it is wont to be affected with Pleaſure or Grief, and other Paſſions depending on either of theſe.

For indeed (as we mentioned before) there are two Chief and Primary Geſtures of the Senſitive Soul, as often as it is moved from its wonted and Natural State or Condition; to wit, either ſhe ſtretches forth her ſelf into a greater Compaſs, by profuſe Pleaſure, as if it affected to be dilated beyond the bounds of the Body: or being overthrown by Sorrow or Grief, ſhe is contracted more narrowly, and runs her ſelf within the wonted Sphear of her Emanations: from this twofold Affection of the Senſitive Soul, all the other Paſſions take their Origine. For truly Pleaſure, or an Elation of the Soul, is its moſt pleaſing Conſtitution, which deſiring to gain for it ſelf by any means, it follows all Objects promiſing it, with Love, Deſire, Hope, Faithfulneſs, Boldneſs, and other means of getting it; On the contrary, Sadneſs or a Contraction or Dejection of this Soul, is a Geſture moſt ungrateful to it; what things then ſoever threaten or induce it, we endeavour to remove away far, by Fear, Hatred, Anger, Deſperation, Shame, Puſillanimity, and other motions of ſhuning it. In the firſt place therefore, we will ſpeak briefly of Pleaſure and Grief, which are according to *Ariſtotle*, as it were a forked meaſure of the Senſitive Appetite, for the double Ladder of Affections, flowing thence, by which ſhe is carried to this or that.

The two Primary Geſtures or Affections of the Soul, are Pleaſure and Grief.

Firſt, Pleaſure and Grief, becauſe they bend or incline the whole Corporeal Soul after a diverſe manner; therefore its two roots, to wit, the Brain and *Præcordia*, are chiefly affected. When the Soul is ſtretched forth in Pleaſure, and is drawn to its utmoſt Sphear of Irradiation, the Animal Spirits being carried within the Brain, ſtir up moſt pleaſant and pleaſing Imaginations; and further, they actuating lively the Nervous *Syſtem*, Cauſe the Eyes, Face, Hands, and all the Members to ſhine, and as it were leap forth; Further, then more fully ſhaking alſo the *Præcordia*, by the Influence of the Brain, delivered by means of the Nerves, they thruſt forth the Blood more rapidly, and as a Flame more brightly inkindled, they pour it forth with ſtrength thorow the whole Body. On the contrary in Grief, whil'ſt the Soul ſinks down, contracted into a more narrow ſpace, the Spirits inhabiting the Brain, as it were ſtruck down by flight, and troubled, put on only ſad and fearful Imaginations, from whence the Countenance is caſt down, the Limbs grow feeble, and the *Præcordia* being contracted or bound together, by reaſon of the Nerves carrying the ſame affection from the Brain, reſtrain the Blood from its due Excurſion, which being therefore heaped up in the ſame place, with a weight, brings in a troubleſome oppreſſion of the Heart, and in the mean time, the Exterior Parts being deprived of its wonted afflux, languiſh and Contract a paleneſs.

They affect the two Roots of the Soul, to wit, the the Brain and the Præcordia.

The aforeſaid Affections of Pleaſure and Sadneſs, which is wont, the Imagination being employed, to be poured from thence on the *Præcordia*, and by and by from that double Root into the whole Corporeal Soul; as to their firſt Originals, wholly depend upon the Senſe. For from the beginning, Senſible Objects affect the Senſory with a certain ſweetneſs or aſperity, and there bring to the Spirits a certain Ovation or Triumph, or Confuſion: from whence preſently the Impreſſion, like a waving of Waters, being Communicated to the Brain, excites the Spirits inhabiting it, into a conſent either of the delight or trouble; and this Affection, being delivered from the Senſory to the Imagination, if it be ſhort, there ends, and is not carried to the *Præcordia*: but if the ſtroke, being carried from the Senſible Object, is, like a more ſtrong waving of Waters, impreſſed more vehemently, it reaches from the Senſory to the Brain, and preſently thence to the Breaſt, that the Motions of the Heart and Blood, are intangled together with the diſorder of the Animal Spirits, ſo as to the firſt Conceptions of the Affections, as well as Notions, there is nothing in the Imagination, or I may rather ſay, there is nothing in the Brain or Heart, that was not firſt in the Senſe: But afterwards, when many Idea's of Pleaſures and Griefs, are impreſſed on the Phantaſie and Memory; then very often without any previous Senſe, or feeling of Pleaſure or Sadneſs, the Imagination being repeated, is wont to excite a Paſſion of the pleaſant or troubleſome thing; for when at any time we conceive in our Mind Good or Evil things belonging to us, not only preſent, but alſo paſt, or to come, that Conception employs the Phantaſie, and not rarely very much exerciſes it: Further, being thence tranſmitted to the Breaſt, it inordinately either Contracts or Dilates the Breaſt, and ſo pours forth the Affection, together with the diſturbed Blood, on the whole Body. A Wiſe and Strong man eaſily moderates the paſſions of Pleaſure or Grief, leſt theſe being brought, either from the Senſories, or ſuggeſted from the Memory, ſhould affect the Phantaſie and the *Præcordia*, by too great a waving; For the Brain and Heart, which are the ſupports of the Soul, ought not to be moved much, by the more light Objects of the Senſes; nor are theſe principal Powers, at leiſure to be preſent at every ſmall thing: Hence ſome have born the torture of the Body, or the cutting off a Member, beyond Stoical Patience, undiſturbed; whil'ſt others (in whom the ſenſible

Grief and Pleaſure firſt of all ariſe from the Senſe.

Afterwards, both from this, and alſo from the Phantaſie, and Memory.

Some are more Pathetical, or moved than others.

ſenſible Species, being above meaſure increaſed, vehemently ſhakes the *Præcordia*) the Skin ſcarce wounded, ſwoon away, or fall into fainting Fits. In like manner it is obſerved, that ſome are carried away by a moſt light Pleaſure of the Senſes into ſoftneſs and Luxury, in the mean time others are ſcarce moved with any Pomp of Delights, or Exquiſite Blandiſhments of Pleaſures. It is obſerv'd in the fruition of a pleaſing Object (which alſo holds of the appulſe of a pleaſant, or a painful ſenſible thing) there happens a certain reciprocation, between the Spirits of the Brain, and the Inhabitants of the Senſory. We imagine the Drinking of excellent Wine, with a certain Pleaſure, then we indulge it; the Imagination of its Pleaſure is again ſharpned by the taſte, and then by a reflected Appetite drinking is repeated: So as it were in a Circle, the Throat or Appetite provokes the Senſion, and the Senſion cauſes the Appetite to be ſharpned, and iterated; this Kind of mutual reciprocation of the Animal Spirits from the Brain to the Senſory, and on the contrary, perſiſts for ſome time, till the ſame, like waving of Water, either leiſurely vaniſhes, or is obliterated, by the exciting of a new waving: So indeed, Paſſions and Deſires wear out themſelves, or are conſumed by time, or they are blotted out by the coming of ſome other Paſſion. When the Animal Spirits, deſiring too much a ſenſible Delight, do often, and for a long time iterate and intend the Appetite, and Act of the pleaſurable Senſion, there is need of Reaſon to come between, whereby they being changed into Sacred and Moral Meditations, may be called away from their Carnal Genius; which Avocation however, they obey not but difficultly and unwillingly; for as much as to be expanded, and to enjoy pleaſing Objects, is the Recreation and Food of the Spirits; and to be reſtrained or kept in, and very much to be employed about the works of the Mind, is to them a Labour, and a difficult task.

How the Affections are wont to be iterated, alſo how allayed or obliterated.

CHAP. IX.

Of the Paſsions Particularly.

The Number of the Paſsions uncertain.

Concerning the Number of the Paſſions, as it hath been variouſly diſputed among Philoſophers, ſo in famous Schools, this Diviſion into Eleven Paſſions, long ſince grew of uſe; to wit, the Senſitive Appetite is diſtinguiſhed into Concupiſcible and Iraſcible, to the firſt, are counted commonly ſix Paſſions, *viz.* Pleaſure and Grief, Deſire and Averſion, Love and Hatred; but to the latter five, *viz.* Anger, Boldneſs, Fear, Hope, and Deſperation, are wont to be attributed: But this diſtribution of the Affections is not only incongruous, for that Hope is but ill referred to the Iraſcible Appetite, and Hatred and Averſion, ſeem rather to belong to this, than to the Concupiſcible: But it is alſo very inſufficient, becauſe ſome more noted Affections, as Shame, Pity, Emulation, Envy, and many others, are wholly omitted: Wherefore, the Ancient Philoſophers did determinate the Primary to a certain Number, then they placed under their ſeveral Kinds, very many indefinite Species. Truely the Senſitive Soul, like a *Proteus*, is wont to be ſo diverſly diſturbed and altered, into manifold Kinds, with the various Fluctuation, and divers ſorts of Inclination of the Animal Spirits, Blood, and other Humors, that a cenſe, or view of all the Paſſions, can ſcarce be had; But however, that theſe, if not all, at leaſt the chief of them, may be in ſome meaſure diſcovered; we will here ordain Pleaſure and Grief for the extreams, or the oppoſite bounds of the Inclinations of the Corporeal Soul; then we will conſider, after what manner, the Objects belonging to either, by what means ſoever may be applied, and what ſorts of Impreſſions they are wont to fix on the Spirits, Blood, and ſolid Parts. The Corporeal Soul therefore, affecting Pleaſure as the greateſt height of its felicity, in which it would acquieſce, is moved at the appearance of any Good: if it be to come, and contrary to opinion, by and by for the getting it, Deſire or Love ariſes; if with Opinion, Hope and Boldneſs; if Opinion eſteems Fruition hopeleſs, Deſperation is raiſed up; if this Good be paſt, or ſhould be loſt by our default, Shamefacedneſs or Repentance is brought in; if it be poſſeſſed by others, Emulation, and Envy; Love is buſied about it being taken abſolute, without reſpect to time or poſſeſſion. Beſides alſo there are other reſpects and habitudes of appearing Good, able to excite many other Affections with eaſe. In like manner on the contrary ſide, Grief or Trouble, is a Sickneſs of the Senſitive Soul, and a Diſpoſition very much ingrateful to it; wherefore, at all the Objects apparently threatning its Induction, the Soul

Pleaſure and what Affections are ſubordinate to it.

Love, Hope, Boldneſs, &c.

Grief with the Affections ſubordinate to it.

variouſly Contracts her ſelf, and is inclined hither and thither, that ſhe might ſhun the approaches of the threatning Evils: wherefore there are ſo many Affections reſpecting Grief, and Subordinate to it, as there are means by which the Senſitive Soul, or the Diſpoſition of the Spirits, compoſes her ſelf for the ſhaking off or the ſhunning of any Evil. Hatred is buſied about Evil taken abſolutely; that being abſent, we proſecute with Averſion, by and by about to come with Fear; and unworthily brought, with Anger; falling upon our ſelves, we ſuſtain it with ſadneſs; inflicted on our Friends, with Pity. There are beſides, many other Appearances of approaching Evil; for the ſhunning of which, the Soul is compelled into many Metamorphoſes, and at the ſame time draws into the like Geſtures, as it were Mimical, the Humors and Members of the Body, and oftentimes the Rational Soul it ſelf: As it would be a buſineſs very tedious, and of immenſe Labour, to rehearſe all the Kinds of Paſſions, and to unfold them, we have deſigned therefore to ſpeak only of the Chief Species of the Paſſions, with their manner of affecting, in reſpect both of the Body, and alſo of the Superior Soul.

Hatred, Averſion, Fear, &c.

Love and Hate follow next, and as it were at the back of Pleaſure and Grief: becauſe the Senſitive Soul, being greatly prone, as hath been ſaid, to Pleaſure, Proſecutes all things apparently Good, without reſpect to Circumſtances, with an Univerſal and moſt ample Affection of Love; in like manner, ſhunning Grief or Trouble; it hates and deteſts all things apparently Evil, which may ſeem to induce Evil by any manner of way.

Next to Pleaſure and Grief, are Love and Hatred.

The Good exciting Love, is objected after a twofold manner; to wit, either to the Senſe, or the Opinion: As to the firſt, Objects which conſiſt of Particles Congruous and Curiouſly fitted to the Senſory, ſo that they ſtroke gently the Spirits there flowing, and cauſe them to run and to rejoyce together, theſe bring forth a deſirable Senſion, whoſe Impreſſion being tranſmitted, by the paſſage of the Nervous Proceſſes to the Brain, by pleaſing there in like manner the Spirits, ſtirs them up into a pleaſant apprehenſion of the ſenſible thing, and a deſire of it: Hence theſe Spirits inhabiting the Brain, for the fruition of this Object, try ſeveral or manifold Endeavours, *viz.* Some being reflected towards the Senſory, deſire to cleave more cloſely, and to be united to this Good: in the mean time, others flowing towards the Breaſt, ſometimes dilate and open the Boſoms of the Heart, that they may more plentifully receive the Blood, imbued with a certain Virtue of the Object, and enjoy it; and ſometimes the Spirits draw together theſe receptacles of the Heart, and drive outwardly the Blood, as if about to ſeek ſomething more largely of Good, from the Object, with which being filled at laſt, it is received by the heart, by and by dilated. Further, in this Affection of Love, concerning the ſenſible Object, if that it be very ſtrong, the whole Senſitive Soul, or the whole *Syſtaſis* of the Spirits is inclined towards the beloved thing, lifts up to it the whole Nervous *Syſtem*, and together with the ſolid Parts, draws, and leads the Humours; ſo, when we are indulged with a fair Aſpect or Melody, the whole Soul ſeems to go out at the Eye or the Ear, and neglecting the other Senſories, Conſpire with their proper Offices into thoſe Acts of Senſion.

The Objects of theſe, are Senſible or Imaginary things.

By what means deſirable things affect the Spirits, and the Blood.

A Pleaſant Senſation is deſcribed.

It is ſomewhat otherways in Love excited through Opinion, becauſe in this, the Species of the Object being repreſented by the Imagination, is erected as an Idol in the Brain; about this many Spirits being employed, at firſt they weigh the noted Beauty, and its various Ornaments, then they worſhip it; for whatſoever we love, we imagine it fair, profitable, pleaſant, and far above what in truth it is; thon by reaſon of theſe kind of feigned Attributes, we more earneſtly fall in love with the thing beloved; Further, the Spirits inhabiting the Brain, invite all the reſt, flowing in the whole Nervous ſtock, to the worſhip of the Idol erected by themſelves: wherefore the Inhabitants of every Senſory, watching for the works of the Senſes, look hither; here alſo they wait for the Motions, Executors of the Limbs and Members; but they chiefly inſpire the *Præcordia* with the Love of this Imaginary Good; wherefore, theſe being variouſly dilated, and thruſt together, greedily receive, ſometimes the Blood imbued as it were with the Character of the thing loved, and as it were imbibe its Influence, ſometimes they caſt forth that Humor from themſelves, towards the Brain, as it were to pick out ſomething from the Image of the Good: This Kind of Image exciting Love, is impreſſed on the Imagination, either from the Intellect, or from the Memory and Phantaſie, to wit, one of them only, or both together; and from thence a Paſſion of Love is brought in, either Metaphyſical, or merely Senſitive, or mixt.

Love is excited by Opinion.

The Object of this, is ſet up, like an Idol, in the Phantaſie, And Worſhipped.

Much after the ſame manner as we have ſaid of Love, the evil Appearances alſo, which excite Hatred or the Averſation of the Soul, are objected to the Senſe or Imagination: As to the former, when any incongruous and improportionate Object, is brought to any Senſory, that diſtracts and drives the Animal Spirits into a certain Confuſion; therefore afterwards, when ſuch an Object comes again to the ſame Senſory, the Spirits mind-

Hatred excited, by the Senſible or Imaginary Species.

ful

ful of their former hurt, abhor the Contact and approach of this Evil, Contract as much as they can the Organ, and ſhut up the Paſſages and Doors; if they are ſtrong they endeavour to remove the Enemy from themſelves, by ſudden and iterated Excurſions; but if they are not able for ſuch Aſſaults, they convey and hide themſelves within, and reject the embraces of the hateful thing, by every manner of way. A rejection of the ſenſible Object happens, when ſtinking Odors of very unſavoury Meat ſtrike the Palate, or Noſtrils; and the like when incongruous things are offer'd to the ſight, or hearing: But eſpecially, when the breaking of the Unity happens to be inflicted by Fire, or a Sword, on the Skin or Fleſh. Concerning theſe repulſes of the approaching Object, not only the Spirits flowing in the Senſory, but oftentimes alſo by the conſent of theſe; others inhabiting the Brain, are irritated into Fury; ſo that the Imagination conceives a deteſtation of the thing; and the *Præcordia* being therefore diſturbed, ſometimes draws back the Blood, ſometimes drives it outward towards the driving away the Evil, and ſtirs it up to its Expulſion.

How the firſt of theſe Affects the Spirits and Blood.

When an Object apparently Evil, appears therefore hateful to the Imagination, preſently the Phantaſie fixes on it a Monſtrous and very deformed Image; then ſtirs up all the Spirits, implanted both in the Brain and the Nervous Appendix, into a Deteſtation of this Imaginary Spectre, from hence the Brows are contracted, the Teeth gnaſh together, and the Face is writhed; but eſpecially the *Præcordia*, variouſly open and ſhut themſelves, that they might Eventilate the Blood, by driving in up and down, and Conſerve it free from every Influence or Tincture of this Object.

The Imaginary Evil affects both the Blood, and Spirits.

After this manner, the Paſſions of Love and Hatred are employed about Good and Evil, taken abſolutely, and almoſt Indifferently; or rather about their Idea's: to wit, the Senſitive Soul, beholding the Image of appearing Good, received from the Senſe or the Imagination, and admitting it into it ſelf, preſently ſhe embraces it with a certain ſtrictneſs, as it were with open and infolded Arms, and endeavours to be intimately united to it: But it reſts not long in this fruition; for if this Image of Good be only Imaginary, and being embraced, vaniſhes like a Cloud, taken for *Juno*, the Soul, ſenſible of her Error, quickly lets go her empty Embraces: yea, if that Good were ſolid, after ſome time, its fruition brings forth a loathing, and the Complacency of the Object at firſt amiable, grows cold, by the enjoyment; and it is eſteemed troubleſome. For indeed it is ſo order'd, that we eſteem nothing long in this Life, but being always wanting, whatſoever is obtain'd, we eſteem leſs, ſeeking after new things; wherefore, we are perpetually incited to the deſiring of abſent Good, and to the flying from Evils hanging over us. Love or laſting Charity, is a Divine Paſſion, almoſt proper only to Heaven, as Hatred, ſtanding and endleſs, is an Affection merely Diabolical, and ought to be eſteemed peculiar to Hell. But in moſt Mortals, theſe are preſently changed into Deſires or Averſions; becauſe the deſire of any abſent Good, which we ſeem to want, or the declining of any approaching Evil, obliterate the Idea of any Good or Evil before affixed to the Senſitive Soul, and adhering to it; even as the following waves ſup up the former.

Love and Hate, are tranſitory Paſſions.

Quickly changed into Deſire, and Averſion.

In truth the Senſitive Soul is chiefly employed with Deſires and Averſions; theſe are perpetually ſuggeſted by heaps from our wants, either true or imaginary, and a very infinite Company or Succeſſion of them exiſt. Concerning our Indigencies, from which theſe Paſſions are drawn, it is to be obſerved, that they proceed either from the Senſe, or from Opinion, and ſo peculiar Deſires or Averſions are excited: As to the former, the Animal Spirits in every Senſory, watch as ſo many hungry Gueſts expecting the Approach of an Object congruous to them, as it were food; to the meeting and ſnatching of which, they are often wont to go as it were to meet it, and be carried quite beyond the Confines of their Subject. But that the Spirits reſiding in the Organ of every of the Senſes, do greedily Covet after this manner the ſenſible Object, as their Prey, happens by the mere Inſtinct of Nature, or is procured by Cuſtom: The former is diſcerned, when hunger or thirſt require the Supplies of Meat and Drink, and when the Coldneſs of a naked Body requires Cloathing: Theſe ſort of Deſires, which Neceſſity puts upon Nature, are eaſily ſatisfied, and what are ſufficient for the maintaining of Life, and obtained after this manner; to wit, the Animal Spirits labouring under a defect, in this or that part, do variouſly Contract, and ſo affect with a ſenſe of trouble the Nervous Bodies, in which they flow, which Impreſſion being preſently Communicated to the Brain, it ſtirs up the Spirits inhabiting it into an Appetite or Deſire, and then an inflowing being made into the appropriate Nerves; into a Proſecution of the deſired thing; all this is performed without the Image of the Object, increaſed by the Imagination, alſo without any Perturbation known in the *Præcordia*, or the Blood.

The Soul is chiefly employed by theſe.

Both proceed, either from the Senſe, or Opinion.

The deſire of a ſenſible thing, is excited, either from Natural Inſtinct, or from Cuſtom.

The former is moderate, and eaſily ſatisfied.

Desire got through Custom, despising moderate things aspires to new things.

It is much otherwise concerning sensible Desires got by Custom; for when as a Fruition once happens to the Spirits inhabiting this or that Sensory, of a more pleasant Object, having moderate things in Contempt, afterwards desire the same, and being not long Content therewith, still aspire to others more pleasant; so the Palate being accustomed to more delicate Victuals, loaths every thing unless spiced Aliments, and prepared with most exquisite Sawce: In like manner may be observed, concerning the Smelling, Sight, Hearing, and other Sensitive Functions; to wit, that the Appetite, proper to any of them, (for as much as it once exceeded what sufficed Nature) is always carried to more excellent Objects, and they for the most part only fresh; the reason of this seems to be, that the chief Pleasure of the Sensitive Soul, consists in a more lively Motion, and larger Expansion of the Spirits implanted in every part; but such a Motion of them, depends very much upon the Excellency, also the Variety, and Change of the Objects. For whatsoever moderate or too familiar thing happens to the Spirits, it little affects them; for every motion supposes a Superior, and a Virtue of the Object, somewhat unlike to the Agent; wherefore, when any Object by daily use obtains a Similitude, or Equality with the Spirits, that is less apt to move them: therefore that the Activity, or the lively unfolding of the Spirits (which is the Effectress of Pleasure) may be continued a long time, leaving the Fruition of every old and worn-out Good, it always tends to new and more high things: After this manner, thô every Organ of Sense puts forth Desires, peculiar and proper to themselves, it reiterates them with a perpetual change; but for as much as Objects applied through Corporeal Contact, rather than by Effluvia, affect more vehemently the Sensory; therefore the greatest Company of Desires, arising from the Sense, are wont to be referred to Luxury, or Lust. The Desires of the Spirits dwelling in the other Sensories, for as much as they take only the Species, or the little Bodies, falling off from sensible things, and less thick Embraces; therefore they are more temperate, and are often directed to better uses.

The reason declared, Because the Agent and Patient, ought to be unlike.

The Desires of sensible things, tend chiefly to Luxury or Lust.

Phantastic Desires are immense.

But our wants are chiefly Imaginary, and proceed from Opinion, and from hence a most plentiful Crop of Desires grows up. For indeed, every Man breaths after Felicity, or after a certain Divine State; wherefore, it seeks very much things apparently Good, which are said to Conduce to this State, and endeavours to obtain them; But having followed certain Goods, it finds not the desired Satisfaction in them; therefore it seems to want others, and then again others. So, for as much as Men always tend to the highest Good, or last end, and that he attains it not in his life-time, there is a Necessity of infinite Wishes, and Desires concerning the intermediate Goods: Hence it is, that whatsoever another has, yea, whatsoever of Good the Phantasie can conceive or feign, presently we believe we have need of it, and therefore we desire it, and wish for it. So, though there is an immense Company of Concupiscible things, yet as most Men place their felicity in Riches or Honours, hence the Chief Species of Desires arising from Opinion; and therefore not to be satisfied, are Covetousness and Ambition.

But are chiefly carried to Riches or Honors.

Aversion is excited either from the Sense, or from Opinion.

As to Aversion, this Passion seems only to be the former inverted, and in like manner, to take its Original, either from a certain Defect, perceived by the Sense, or taken from Opinion; for a Sense or Opinion of want, calls to either, a declination of the same manner of State: Wherefore, when the Animal Spirits in the Sensories, are deprived of the Enjoyment of a necessary Good, or of what they were before accustomed to, they either conceive, or set before them the approach of its Contrary, and these being very unquiet, let go the Embraces of every present Object, and set themselves to perform, or enter into a new Confederation; until either the Sense or the Opinion, shall detect some apparent Good, to the desire and following of which, the same Spirits are busied; And so Aversion, being for the most part a Passion of it self Vain, and quickly perishable, terminates in the desire of Good, that may supply the Defect so Carefully shun'd.

This Passion being frail, is soon changed into Desire.

Having shown after this manner for what Causes, and upon what Preparations or fore Occasions, the Sensitive Soul enters into Passions of Desire and Aversion: Let us now see after what manner or ways of Gesticulations or Gestures, she is Composed in either Affection. As to Desires begun from the Organs of the Senses, it is observed, that whil'st the Spirits there implanted, are carried towards the absent Object, all fruition being left, they, as it were naked and destitute of all helps, like Beggars ask an Alms, which as they most greedily desire, as it were about to take by force that Good, they exceed the limits of their Subject; and oftentimes, when the Desire is vehement, almost the whole Soul is drawn into Parties, and by a certain going out from the Body, wanders towards the desired thing, or at least emits a Portion of it self. That it is so, it plainly appears, in that mad affection of Lust, in which the genital Humor, containing Fragments picked from the whole Soul is poured forth. In like manner, in a pleasant

Sensible Desire affects both the Spirits and the Blood.

pleaſant Sight, Sweet Odor, and moſt pleaſing Harmony, the Animal Spirits, as it were lifted up, role together out of the Senſories towards their Objects: but on the contrary in Averſion, they betake themſelves inward, and ſometimes forſake the Senſories themſelves.

What Alterations Imaginary Deſire brings upon them.

As to deſires excited by reaſon of the Opinion of want, the Senſitive Soul being impatient of a Lot ſo poor, becomes very inſtable and unquiet, all the acquired Goods of its Body, it neglects and diſeſteems, alſo refuſes to hearken to the dictates of Reaſon; yea being altogether precipitate in deſires, ſhe always looks outward, and as it were with wings is ready to fly to this or that apparent Good; hence, by the diſorder of the Spirits, flying hither and thither the Nervous Parts are variouſly diſtracted, and Men betray their deſires by their Countenance, and going; alſo the Breaſt and the *Præcordia* being moved together, the Blood, like the Sea working with the winds, is compelled into various Fluctuations, that thoſe affected ſometimes grow Pale, and ſometimes are overſpread with redneſs; alſo, from the ſame Blood, entring inequally and impetuouſly the Confines of the Brain, ſucceed inconſtancy of Judgment, and frequent Changes of a thing propoſed; as ſometimes they will do this, anon that, as *if ten Minds were together by the Ears in one Man.*

The Fluctuation of the Mind.

Plaut.

Hope and Fear.

According to the aforeſaid Characters or Scheams, the Senſitive Soul is compoſed, about abſent Good and Evil, and not quickly about to come; but when theſe ſeem to be at the Doors, the Soul alters her Poſition, and is reſpectively urged with Hope or Fear: Concerning which, Firſt it is obſerved, that theſe Paſſions do not as the forementioned proceed equally from the Senſe and the Imagination, but are founded only on Opinion; from whence, after entring into the deſire of any thing, the Spirits being Solicitous concerning the following of it, and as it were depreſſed, when they upon ſome other Occaſion, as the Drinking of Wine, are a little elevated with the fruition of another pleaſing Object, and they begin to ſtrengthen Opinion, forthwith doubtful deſire is changed into a certain Confidence, that we hope ſhortly to poſſeſs the deſired Good: In like manner, when as Averſion beholds the abſent Evil a long way off, the depreſſion of the Spirits places it near, and by and by Cauſes a fear of its being about to come upon them. Indeed, Hope and Fear, are very near of Kin to Deſire and Averſion, and either of theſe Symbolical Affections, denote only the more near, or more remote approach of the ſame Object.

Succeed to Deſire, and Averſion.

The Proviſion of Hope.

As to what appertains to the Proviſion and Exerciſe of Hope, when we deſire greatly any abſent Good, and that an Opinion ariſes, that we ſhall ſhortly obtain it, preſently the Animal Spirits, who firſt like Soldiers ſent before, carefully ſeek after, and obſerve the willed thing, forthwith returning towards the Soul, bring News of the Coming of its Gueſt, and prepare a Reception for it; wherefore the whole Soul is preſently brought into an Expectation of its coming; all the Doors of the Senſes are opened, that this Good, with all its Train, might enter thorow open Gates: In the mean time, the Spirits inhabiting every Senſory, are prepared to go forth to ſalute this approaching; the Imagination doth foreſtall its Entrance; to wit, this frames an Idea of the wiſh'd for and coming Good, which it places within its Borders, as in a Throne, and confers on it Adornments and Splendor, borrowed from the Phantaſie. Moreover, the *Præcordia* are Careful for a part of its Reception; for they being actuated with a more full Influx of Spirits, ſend forth the Blood more lively into the Exterior Parts, as it were for the meeting of this new Gueſt; hence, any one being full of Hope, feels in his whole Body, a certain Inflation, with the Spirit and Heat plentifully poured forth: Then, if by any accident, an occaſion of fear or doubting is brought in, preſently a ſudden girding together in the whole, with a certain putting down of the Spirits, and a ſinking of the whole Soul, enſues.

Its Object, both the Senſe, and the Imagination.

Affects both the Spirits and the Blood.

A Character of Fear.

For in the Paſſion of Fear, the Senſitive Soul being firſt ſtretched out, being ſtruck by the nearneſs of the approaching Evil, and being as it were prickt on every ſide, for as much as ſhe conceiving her ſelf taken by the Enemy, cannot fly away into this or that Part, ſhe enters into her ſelf, and that the Animal Spirits may be preſſed together, ſhe is Contracted moſt ſtrictly; if the Affection be vehement, whilſt the Animal Spirits ſuddenly go back, from the Superficies of the Body, they greatly bind up at the ſame time the Pores and Paſſages, as it were faſtning the Doors, to ſhut out the Enemy: from this Conſtriction, the Pores of the Skin being drawn inward, oftentimes ſucceeds an erection of the hairs, or the hair ſtanding an end; then the ſame Spirits being acted into Confuſion, they are inhibited from performing the wonted Offices of their Functions, and not only want the helps of Reaſon; but ſometimes the Locomotive Faculties fail, yea by a reſolution or looſ'ning of the Nerves, made in the Bowels, oftentimes the Excrements involuntarily flow out. Further, when the Animal Faculty languiſhes ſo much, the Motion of the *Præcordia* is tyred; hence the Blood ſtagnating within the Boſoms of the Heart,

How it Affects the Spirits, and all the Faculties.

How the Blood.

Heart, oftentimes a ſwouning follows: and when therefore it is not carried lively enough into the outward Parts, a Coldneſs and Paleneſs ſucceeds in them. In a ſudden fear, we feel a certain ſtiffneſs, whence 'tis commonly ſaid, that the Blood is curdled in the Body; but this happens, becauſe, whil'ſt the Nervous Parts compaſſing about the Blood-carrying Veſſels, are ſuddenly bound together, they at the ſame time repreſs the Blood from its Excurſion, and ſo ſtop or plainly invert its Circulation.

It often paſſes into Deſperation.

In the mid'ſt of fear, leſt the Spirits being driven too much into flight, the Senſitive Soul ſhould be wholly looſned, Reaſon is wont to interpoſe ſomething of Hope, and ſo by degrees to lift up the dejected Spirits, and to animate them to ſtay, ſo that this Paſſion being alleviated by ſuch a remedy, may more eaſily paſs over; but if by the ſtrong Evil falling on one, all means of Hope be cut off, then a greater Affection, to wit, Deſperation, comes in the place of Fear, in which for the moſt part, this Soul yielding her ſelf overcome, wholly ſinks down, and being half dead, is drowned in her proper Body, as in a Sepulcher, or if ſhe retains any ſtrength, preſently being carried into Confuſion, all things being turned upſide down, ſhe Contracts, Melancholy, or Madneſs.

In like manner Hope into Audacioufneſs.

As Deſperation follows Fear, all helps being cut off; ſo Hope, when it is joyned to more, and more certain, of the ſame, paſſes in Audacioufneſs: And in this Affection, the Senſitive Soul ſwells up, and oppoſes her ſelf dauntleſs to any enſuing Evil; wherefore, the Spirits Guardian, by a more ſtrong Connexion of themſelves, every where extend the Muſcles, and ſtrengthen them, by a more full Inſpiration, to the bearing or reſiſting any thing; hence the Breaſt being inlarged, and then ſtrongly bound together, a bigger Voice is ſent forth; the Fiſts being Contracted, the Arms lifted up, the Head erected, the Face grim and threatning, the Neck ſwollen, and the riſing up, or the ſtretchings forth of other Parts, ſhew the Animal Spirits in the whole Body, unfolded and prepared for Battel, as if about to enter into Conflict: In the mean time, the *Præcordia* being moved moſt ſtrongly, by a more full influx of the ſame Spirits, notably rarifie the Blood, and like Lightning, ſend it forth impetuouſly, and drive it into the outward Parts.

To which Anger is of Kin.

Anger is of ſome Kin to Boldneſs, in which the Senſitive Soul, by reaſon of the Evil unworthily brought to it, at the ſame time is made ſad, and grows hot; wherefore, as ſhe Contracts her ſelf by reaſon of Sadneſs, ſo preſently girding her ſelf for Revenge, ſhe is dilated; therefore, as here divers Contractions come together, this Paſſion is performed with a mighty Perturbation of Spirits, and of the Blood: for thoſe affected, at the beginning wax Pale, by and by they are overſpread with Red; the Forehead is wrinkled, the Lips quiver, the Tongue murmurs, the Countenance is ſometimes caſt down, ſometimes lifted up, and threatning, but the *Præcordia* are eſpecially agitated, with a notable heat and boyling up of the Blood: which kind of Various, and ſometimes Contrary Symptoms, may eaſily be reſolved; to wit, that the Soul at once conceiving Sadneſs and Indignation, like the Sea working with oppoſite winds, has Floods excited from every Coaſt, and ſtriking one againſt another among themſelves.

The character of Anger.

There are more than Eleven Affections.

Beſides the Eleven Affections even now recited and unfolded, according to the Vulgar Opinion, there remains ſome others, excited according to the other manifold Affections and Geſtures of the Corporeal Soul; the chief of which are Pity and Envy, Glory or Boaſting, and Shame; which however are very near related to the afore recited, or are Compoſed out of them. For Pity is made out of Love and Sadneſs, by reaſon of the Evils of a Friend: On the contrary, Envy out of Hatred and Sorrow, by reaſon of the Good things of an Enemy: Glory or Boaſting, is a certain kind of Joy and Exultation, conceived by reaſon of an Opinion of our Good, had from others; and Shame is a certain Sadneſs and Conſternation of the Soul, by reaſon of an Opinion of our ills conceived by others. Further, Concerning this Paſſion 'tis obſervable, that when the Corporeal Soul being abaſhed, is enforced to repreſs its Compaſs, ſhe notwithſtanding being deſirous, as it were to hide this Affection, drives forth outwardly the Blood, and ſtirs up a redneſs in the Cheeks, to wit, the Senſitive part of the Soul, as it were hiding its head, puts before her ſelf a Portion of the Vital or the Bloody Soul, under whoſe wings ſomewhat ſtretched forth, the Confuſion might be hid.

Pity, Envy, Boaſting,

Shame, &c.

A Character of Shame.

Beſides we take notice, that the Corporeal Soul is not only affected by Objects, and their Impreſſions, and compelled into various Geſtures, and the aforeſaid Paſſions; but beſides, ſhe hath certain innate Diſpoſitions, by reaſon of which, by the mere inſtinct of Nature, without any Influence of the Object, ſhe puts forth her ſelf, and is excited into certain Emanations or Spontaneous forces: Of which ſort are firſt an amplification or inlarging the Individual Perſon, and then a Propagation of its Kind. It is Natural for every Animal without example or teaching, to ſeek for, and ſwallow down its food, both

Innate Affections.

both that the Body may be daily increased to its due Magnitude, and also that the Soul, being daily supplied with a new Store of Spirits, may be co-extended to the Body, and be able lively to perform the Acts of her Functions. Then, as soon as the Lineaments both of the Body and Soul being sufficiently drawn forth, and the Bulk and Compass of either are Compleated; some Animal Spirits flowing over from the work of the Individual, begin to abound, and then being separated into the Genital Parts, with a subtil Humor picked from the whole Body, destinated for the Propagating the Species, as it were in a Store-house, and there layed up, they form there the Idea of a new Animal; which afterward is transferred into a convenient Womb, to be perfectly formed. When the Seeds of a new Animal are so lay'd, the whole Corporeal Soul is drawn with all its Powers into this work of Propagating the Species, more than of the Conserving of the Individual: wherefore the Blood supplies the Testicles, no less than the Brain, with a most subtil and noble Matter for the store of Animal Spirits: and when after too great Expence, the Spirits are deficient in them, that presently the loss may be made up, oftentimes the Brain and Nerves are defrauded of their due Pension, and are suffered to languish, that in the mean time the Blood may pour forth more plentifully spirituous Particles into the Spermatic Vessels. Yea it is thought, that it doth sometimes snatch the Animal Spirits from the Brain it self, which it bestows on the Genitals, in the Act of Venery: For it appears so, when by immoderate Venery, the Brain presently labours with a want of Spirits; for as much as from thence there is no passage for them, to the Spermatick Vessels, but by the Blood; if that the Animal Spirits superabound with a Prolifick Humour, Swelling up within the Genital Parts, presently the whole Corporeal Soul, as it were incited, to the begetting of a young one, is inclined to Concupiscence or Lust: The Incentives of Lust, even against the Mind, are sought for, and they are lay'd hold on, however brought by any Sense; the Blood boils up, the Marrow in the Back grows hot, the Eyes are inflamed, the Genitals are inflated, so that there wants little (unless Reason coming between recalls her, and Prohibits her from the Beastliness of it) but that the whole Corporeal Soul, on every occasion, should be dissolved in Lust. In these kind of Affections of Concupiscence, may be most clearly discerned the distinct Strivings, and contrary Endeavours of two Souls: because, whil'st the Corporeal Soul being incited to Lust, inclines her self wholly towards the Genital Members, and Compels thither greater floods of the Blood, and greater store of the Animal Spirits, the Heart and Brain being left wanting of Provision; on the contrary, the Superior Mind, rising up, and shewing the Commands of Reason and Religion, shews a receipt to the other, and Commands that the Animal Spirits return to their tasks, to be performed within the Brain, and also that the raging Blood should be recalled towards the *Præcordia*, and being there suppressed, might be restrained from disorderly Excursions; Hence, the flame of Lust being re-extinct for a time, and the Powers of the Inferior Soul being reduced into Order, the Acts of Sobriety, Prudence, and of other Science, and Discipline may be exercised; but if the reins of Reason be let loose, or new incentives of Lust are brought, the Corporeal Soul, shaking off the yoak, snatches her self again to the like Enormities.

Viz. An Inlargement of the Individual,

A begetting of its Kind.

Venus an Enemy to the Brain and Nerves.

The madness or fury of Lust,

Reason suppresses its flowing.

There remain yet some other Affections of the Corporeal Soul, as Sleep and Watching, Grief and Pleasure, excited in private Members; which, for as much as they respect not the whole Soul at once, but this or that Portion of the Body, or Peculiar Powers of it, and chiefly the Sensitive or Locomotive; therefore we shall handle these anon, and shall next proceed to the Sense and its Kinds.

CHAP. X.

Of the Sense in General.

THe Vital or Flamy part of the Corporeal Soul, being rooted in the Blood, seems not much to know or perceive what things are offer'd outwardly to, or acted inwardly in the Body: So, altho the Blood have life, yet 'tis scarce sensible or knowing, for this which ought to be always employed, with a perpetual Motion, and even inkindling, for the Offices for the sustaining of Life, cannot be at leisure to mind any smaller Matters, or outward Accidents. Indeed great Passions also in some measure disturb the Blood, and pervert and variously drive it from its wonted Course, and like violent Blasts, shake not only

The Blood is animated, but hardly sensible.

only the Leaves or Body of the Tree, but alſo ſometimes pull up the Roots out of the Earth: So whatſoever mutations or alterations happen to the Blood, proceed either from the Complexion of its Liquor being changed, or from the impulſe or incitation of the containing Bodies. But the other Senſitive part of this Soul, which being diffuſed within the Brain and ſtock of Nerves, is Co-extended or equally ſtretched forth with the Organical Body, and almoſt with all its Parts, is affected with every Contact, or with the meeting of other Bodies, ſhe perceives all Impreſſions either outwardly objected, or raiſed up within; and as ſhe is moved by theſe, every where diverſly inflicted, ſhe indues according to the various impulſe of the Objects, various Geſtures and Species in her ſelf, and alſo draws the Members and Parts of the Body it ſelf, with her wholly into the ſame Figures and Motions. For indeed it is the Energie or the Act of the Soul it ſelf, from which every Function of the animated Body principally and chiefly ariſes. If at any time any Stroke or Impreſſion be inflicted any where to the animated Body, preſently a certain Fluctuation or waving is ſtirred up in the *Hypoſtaſis* of the whole Soul, or of the ſtruck Member; by which, ſome Animal Spirits of ſubtil Particles, ſhut up in the Organical Parts, as a blaſt of Wind in a Machine, being ſtruck, run hither and thither, and ſo produce the Exerciſes of Senſe and Motion in the whole Body, or reſpective Parts.

The lucid part of the Soul feels or perceives the impulſe of all Objects, and is moved by them.

Truly, among the various Geſtures of the Corporeal Soul, by which, ſhe altering her Species or *Hypoſtaſis*, brings a change to the containing Body, the Senſitive and Locomotive Powers obtain the chief place; for as much as they are Common almoſt to all living Creatures, at leaſt to the more perfect, to which alſo all the reſt of the Faculties may eaſily be reduced. Theſe are the chief Advancers of the animated Body, upon which all the other Wheels of this Self-moving Divine Machine depend.

Senſe and Motion, are the chief Advancers of the animated Body.

But the Internal and next efficient Cauſe, both of Senſe and Motion, are the *Hypoſtaſis* of the Senſitive Soul, or the Animal Spirits, inſtilled from the inkindled Blood into the Brain, and from thence diffuſed into the Nervous Stock: which being diſtributed from the Brain, as the Fountain thorow the Nerves to the whole Body, imbue, irradiate, and blow up all the Parts, and bring a certain Tenſity or ſtretching forth to each; ſo that the paſſages of the Nervous Bodies, like Cords ſtretched forth ſtraitly on every ſide, from the Brain and its dependencies, reach forth into all the Exterior Parts, by which, ſo ſtretch'd forth, and actuated by a certain Continuity of the Soul, if one end be ſtruck, preſently the ſtroke is perceived through the whole, ſo that every Intention conceived within the Brain, preſently performs the deſigned work, in every Member or Part; and on the other ſide, every impulſe or ſtroke, which is inflicted from without to any Member, or to the Senſitive Body, is communicated inſtantly to all the Parts within the Head. If that an Impreſſion or force tends from the Brain outwards, thorow the Nerves into the moving Parts, Motion is produced; but if they being made outwardly, are directed inwards towards the Brain, Senſe ariſes. But whilſt either of theſe are performed, it is not ſo to be underſtood, (as is commonly aſſerted) as if the ſame Spirits make haſt, and leap back preſently, as it were from one end of the Courſe or Circuit to the other; but as the Soul is ſtretched forth, thorow the whole, with a certain Continuity, its Particles, *viz.* the Spirits contiguous one with another are ſet like an Army in Array; for they after a Military faſhion, whilſt they move not from their Station, and keep Order, perform their Offices; and whether they be ſet in Battel Array, or on the Watch, they perform the Commands carried outward from the Brain, themſelves being almoſt immoveable, and effect Motion, and deliver preſently to the Brain the news of any ſenſible thing impreſſed, whereby Senſation is made. So indeed, the ſame Animal Spirits, tho with an oppoſite and inverſe tendency, and aſpect of them, cauſe Motion and Senſe: But both Faculties, as to the Exercifes of their Acts, require ſomething divers Organs; yea, the Animal Spirits planted within the ſame; for the performing the divers Offices of their Faculties, are ordered with a various Affection, and with a different manner of Orders. That each of theſe may be the more clearly illuſtrated, we ſhall firſt of all ſpeak of the Senſe, and of whatſoever belongs to it both in General and in Special, and then afterwards concerning Motion.

The efficient Cauſe of either, are the Animal Spirits.

A moſt ſwift Communication of them, implanted within all the Parts.

An oppoſite tendency of them, effect both Senſe and Motion.

What the Senſe is.

The approach of the ſenſible Object, is made either by Contact, or by Effluvia's ſent forth, or by reflected and repercuſſed Particles of the Air, Breath, or Light.

The Senſe, as it is taken in a more ſtrict acceptation (*viz.* for the proper Function in animated Bodies, and by which they are diſtinguiſhed from inanimates) is wont to be deſcribed after this manner; *That it is the faculty of perceiving Senſible Objects.* Becauſe, the Senſitive ſoul, as hath been ſaid, being apt to be affected or moved by every Contact or Impulſe of an exterior Body, forces its conſtitution to vary in the whole, or in part, according as it is ſtruck: But exterior Bodies, becauſe they conſiſt of Particles, of a various Kind, and diverſly figured, therefore, when ſome are applied to others, their approaches one among another, are not always made after one and the ſame manner, but after a manifold manner, and with notable variety; to wit, either by Corporeal Contacts,

tacts, or by Effluvia's falling from them, or by Particles of Air, Breath, or Light, reflected from them, issuing from them on every side like Darts. Further, and to every one of these Kinds, many Species are attributed: Because, not only Concretes, but also various little Bodies of the same Subject, shew and impress manifold Types of their Contacts; several of which, as they are received and so known distinctly, by living Creatures, the Sensitive Soul using Corporeal Organs, hath many Sensories, fitted for such variety of Objects, and divers representations of things; in which several, both the Conformation of the Pores, as also the disposition of the Animal Spirits, are proportionated to the little Bodies, sent in from the Object, which are only of one Kind, fitly to be received. By this means sensible Impressions, at least that may be of use to any Animal, are perceived, and from this manifold way of Sension, proceeds the Knowledge of all things, according to that of the Philosopher, *All Knowledge is made by the Sense*; when on the contrary, if Bodies and their Particles, should strike the *Systasis* of the naked Soul, or part of it, always after one and the same manner, nothing at all would be known, because one thing or parts, from another, or these from those Members, would not be distinguished. Wherefore, that all the chief Objects and their Accidents, might be distinctly noted, it is so provided, that some Particles strike this Organ and not that; so that they affect their several respective Sensories only, the rest being untouched.

As these several are made manifold, they require divers Sensories.

All Knowledge from Sense.

From hence it is clear, that 'tis necessary that there should be many Sensories in perfect Animals; which may perform divers Actions, both for the preserving of Life, and propagating the Kind, and also for the knowing many things, and chiefly for the embracing of what things are Congruous to themselves, and for the shunning all incongruous things; for these things 'tis needful, that the Sensitive Soul should be affected by the Objects, after a various manner, and so perceive their manifold Influencies. How vile their Condition is, and how hard their Lot, that are gifted with the only sense of the Touch, appears from the Life and Operation of the more imperfect Animals, as Oysters and Lympins; then besides, how false is the Opinion of some, who say, That every Sense in all Animals is the feeling only; for altho every Affection is made by Contact, from the Object to the Soul; yet neither is the same thing still employed, nor received after the same manner; but how many types soever of sensible things are to be found, so many Counterfeits remain in the Sensories.

In Perfect Animals, there ought to be many Senses.

That one of the Touch or Feeling, suffices not.

Nevertheless it may here be rightly Quæried, How it may be? for as much as the whole *Hypostasis* or Contexture of the Soul, is made up of most subtil and also most highly moveable Particles, that every one of them wheresoever implanted, are not indifferently moved, by every sensible stroke; when especially the Interior frame of the Soul, which is Common to all the Sensories, receives the Affections of every one, and so is mediately affected by every sensible thing: I say, why the Spirits implanted in the Eye, do not equally perceive Sounds and Smells, as they do Colours? for as much as they inhabiting the streaked Bodies, discern both these, and all other sensible things.

How the same Spirits receive sensible Species so very divers.

For the resolving of this Problem, these two things are to be supposed, to wit, first, That the Structure of every Sensory is so made, according to its Pores and Passages, that Particles only proportionate to them may be admitted in: wherefore as Light, and the Images of things, pass thorow Glass, and clear Bodies; not dark Bodies; so the same are received only by the Eyes, and not by the other Sensories: The same Reason holds of all the rest. For we may observe, when in the Circumambient Air, or in the Atmosphere, there are Bodies of a various Nature, and of a divers Configuration, that some things affect this, others that Sensory, and so the things which are of a several Kind affect the particular Organ of the Sense. As for Example, the Particles of most thin Air or Light, which seem to be of a Sulphureous Nature, being reflected from Bodies, Convey (as was said) their Images into the Organs of the Sight or Seeing; the little Bodies of Air which seem to be saline, being repercussed from Solids, shake the Drum of the Ear, by their leaping back; yea, and the same being made clammy by a sweet dew, or moistned, affect the taste; the Particles of the same Air, filled with sweet Exhalations, strike the Nostrils: And lastly, The same stuffed with warm or cold Effluvia's, move the Sense of Feeling: But in the mean time, the Particles of the same Air or Element, which are proportionate to one Sensory, are incommunicable to the rest.

That this may be done are required,

First a Structure of the Organ after a diverse manner.

But Secondly, the Animal Spirits themselves, which reside in the Organs of the Senses, and that are like Watchmen, are furnished for the respective meetings of the Objects, with a certain peculiar Provision, and an appropriate manner of Disposition: for when some Spirituous Particles, more pure than others, and more subtle exist, some more dull or blunt, others notably moveable, these Naked, those smered with Humor, and marked with many other Affections; it is so provided, that as the Naked Spirits, or those less

Secondly, a Various Constitution of the Animal Spirits.

gifted ſuffice for the Senſe of Feeling, theſe without any farther indowment are diſpoſed every where in the Membranes, and fibrous Fleſh; but the moſt pure Spirits, and as it were Chryſtalline for the Sight, flow into the Eyes; thoſe that are highly moveable are fitted for the Hearing, and the more Viſcous, which are fuſed with a requiſite Humour, for the Taſte, and Smell.

After what manner Senſion is made.

Theſe things being thus premiſed, concerning the Multiplicity and Difference of the Senſes, and the Organs, we will now inquire into Senſion it ſelf; by what means, and after what manner it is performed. Concerning theſe we thus ſay in general, that the Object being applied to the Senſory, (whether it be done immediately, or the Particles of the Air or Element coming between) doth impreſs its Idea or Character on the Spirits implanted in that place; and in the ſame inſtant, by a continued Series of the Animal Spirits, as it were an Irradiation, the Type of its Impreſſion doth paſs from the Senſory to the Head; and whil'ſt the Spirits actuating the ſtreaked Bodies, are in like manner affected by it, a perception of Senſe, begun from the Organ, is formed.

All ſenſible Impreſſions do beam forth from all the Organs, into the ſtreaked Bodies.

That Sight is ſo performed, Dioptrick Experiments do plainly ſhew, by which, the ſame Species of any Body, by a Glaſs artificially placed, may be Carried or Reflected hither or thither, and may be figured and beheld at once in ſeveral places: why in like manner, may we not Conceive the Image of the Object repreſented in the Eye, as in a Glaſs, to propagate its likeneſs from thence further to the ſtreaked Bodies? But as to the other Senſories the Buſineſs ſeems more hard to be unfolded, becauſe the ſenſible Species, for as much as they are more Corporeal or thicker, cannot be conveyed to the Head with ſo quick a paſſage, and almoſt unperceiveable like Lightning; but as to theſe, it is to be underſtood, that althô the Smell, Touch, and Taſte, require more near and more Corporeal approaches of the Object, than either the Sight or Hearing; yet the Animal Spirits, which as it were *internuncii*, are placed within every Organ, and the chief Senſory, equally and as eaſily tranſmit the ſtroke or impulſe of every Kind; Becauſe as the Spirits are diffuſed thorow the whole Nervous Syſtem, and thorow the Head it ſelf, as it were with a continued beaming, every Impreſſion by the ſtroke of the Eye gets ſooner from one bound to the other; yet the Character of the Object, is conveyed by the like Motion of their Neighbors, and as it were by a certain waving, even to the ſtreaked Bodies.

In every Senſion is required, Firſt, That the Species be impreſſed on the Senſory. Secondly, That it be carried thence, by the paſſage of the Spirits to the Common Senſory.

Hence it follows, that for the Act of Senſion, theſe two things are required. Firſt, That the ſenſible Species be expreſſed, ſo as it may be impreſſed on the Senſory: And Secondly, That the Idea of the ſame Impreſſion, be carried thence, by a like Affection and Motion, by the Spirits flowing in the intermediate paſſages, to the Common Senſory; for otherwiſe Senſion is not performed, as it appears, when being intent on other things, we take not any notice of any Objects, thô they approach near to the Eyes, or the other Organs.

How the divers ſenſible Species are diſtinctly repreſented, in the ſame Common Senſory.

But here we may have a Cauſe of Doubting, how the manifold Species of ſenſible things, for the receiving of which, many Organs, and thoſe diverſly framed, are required; do all come together within, and are diſcerned in the ſame Common Senſory; For it is a wonderful thing, that the ſame ſtreaked Body, conſiſting of a make not much unlike, ſhould admit, and know diſtinctly in it ſelf, the univerſal Idea's of Objects. As to this we may ſay, that the Images of things to be perceived by the Senſe, are not diſtinctly painted in the Common Senſory, as on a Table; but every Impreſſion there ſhown, depends on the Motion, as it were by a certain waving, of ſome Spirits ſeparate from others, and within theſe or thoſe peculiar Tracts of them: Nor is it irrational to affirm, that ſome Spiritual Particles are moved within the *Hypoſtaſis* of the Senſitive Soul, and her the ſame Portion of it, whil'ſt others lye quiet, lying between them; for it plainly appears, and which afterwards is more largely ſhown, that within the Body of the Air, the lucid Particles are agitated, whil'ſt the reſt lye at eaſe; yea alſo, that Sonorifick, yea and odorous little Bodies, and perhaps many others of another Kind, are moved by a diſtinct and peculiar Agitation apart by themſelves, from the other texture of the Air; for both Images paſs thorow, Sounds are poured out, Odors flow, warm or cold Effluvia's, and other little Bodies are variouſly carried; yet notwithſtanding, others in the mean time are neither driven by force by ſome others, nor is the Conſiſtency of the whole Air diſturbed by ſome Singulars. Yea, various Impreſſions, not only paſs thorow the Air unchanged, but alſo the Superficies of the Water; for we have obſerved in a River, or a Fiſh-pond, when many wavings have been ſtirr'd up, by various and divers ſtrokes together, that all of them, however they meet one another, paſs thorow, or cut one another, continue ſtill diſtinct, and inconfuſed; why then may we not ſuppoſe, that in the Airy *Syſtaſis* of the Soul, (which alſo is founded in a Watry Humor) there are Particles of a various and unlike make, and that manifold Species, by

It is ſhown by an example of the Air, whoſe divers Particles have divers carryings forth.

Alſo by the example of Water, in which, many wavings being at once made, are all diſtinct.

their

their paſſing thorow, may be at once brought to the Common Senſory, without Confuſion? As for Example, Suppoſe that for ſeeing moſt Subtil and as it were Ætherial Particles, others almoſt Saline and notably moveable for the Hearing, and ſo for the other Senſes, Spirits endowed after this or that manner, to be interwoven together, and every peculiar Senſion to be produced, by a particular affection of them; to which it happens, that for the various paſſing thorow of the Spirits of ſo diverſe a Nature, divers Tracts or Paths are produced, both in the Organ it ſelf, and in the Common Senſory: and ſo, when the Animal Spirits are affected, which are of this or that Nature apart from others, which are of another Nature, and as there are beamings forth of ſeveral kinds, as it were within various Inlets or Paſſages; 'tis no wonder, if in divers Organs, diſtinct Acts of Senſions are performed; and that all of them, however different in Kind, and coming together from many ways, are ſhewn within the ſame Common Senſory, to wit, the ſtreaked Bodies; becauſe in this Marrowy Part, Spirits of every kind abound, and alſo paſſages of every ſort of Conformation are found; therefore, every Impreſſion impreſſed on any Organ from without, may be diſtinctly repreſented in this ſame Body. That it is ſo, it more clearly appears from hence, becauſe both the ſtreaked Bodies, and the way leading to theſe, conſiſt of many white Ligatures, which ſeem as ſo many ſoft Nerves, or marrowy Tracts, for the divers ways of receiving the Impreſſions of ſenſible Species.

The like is in the Airy Hypoſtaſis of the Corporeal Soul.

For the divers Perceptions of which, together, in the Common Senſory, there are many and diſtinct Tracts produced.

When a ſenſible Impreſſion is brought through the Animal Spirits, being affected by a continued Series, from the Organ to the Common Senſory, if it be light it is there terminated, and the perception of the External Senſe quickly vaniſhes, without any other Affection; but if (which more often happens) the impulſe of the Object be ſtronger, the Senſe excited from thence, like the vehement waving of waters in a Whirl-pool, both partly paſſes thorow the ſtreaked Bodies, and going forward to the Callous Body, it oftentimes raiſes up two other Internal Senſes, to wit, the Imagination and Memory, either one or both of them; and alſo is partly reflected from them, and from thence, by a declining of the Spirits, leaping into the Nerves, local Motions are made.

Senſible Impreſſions, as they are ſtrong or weak, ſtir up other Powers, either more or fewer.

For indeed Impreſſions of ſenſible things, from the beginning, furniſh both the Imagination, with the Memory and Appetite, and induce the firſt attempts of local Motions. It is firſt effected, for as much as the ſenſible Impulſe, is often propagated beyond the ſtreaked Body, into the marrowy part of the Brain, or the *Cortex*, or the extream Confines of it. But local Motions ordinarily ſucceed to Senſion, for as much as the Animal Spirits being ſtruck back from the bolt or ſtay of the ſtreaked Bodies, ſpring up outwardly, and as they enter theſe or thoſe Nerves, by a certain Conſequence, or by chance, they excite fortuitous local Motions, or depending on the previous Senſe; for in the reciprocal exerciſe of theſe Faculties, to wit, of Senſe and local Motion, (before Animals are imbued with Phantaſie and Memory) almoſt the whole Animal Function conſiſts; becauſe Brutes or Men, whil'ſt they as yet know not things, want Spontaneous Appetite. So long therefore, they being deſtitute of the Internal Principle of Motion, move themſelves or Members, only as they are excited from the impulſe of the External Object, and ſo Senſion preceding Motion, is in ſome manner the Cauſe of it.

All the other Powers of the Soul proceed at firſt from Senſion.

Therefore in every Senſion, the Animal Spirits are moved; and their Motion being excited, in the utmoſt Senſory, from the approach of the Object, and harmoniſed according to its Impreſſion, turns inwards, and (as hath been ſaid) is conveyed to the firſt or Common Senſory: wherefore it is not to be thought, that the little Body's ſent from the Object, do penetrate deeply, and enter the inward parts of the Brain it ſelf (as ſome have aſſerted); but it ſuffices, that they being caſt forth like Darts from the ſenſible thing, do affect the Spirits placed in the fore-front; and then, they from thence moſt ſwiftly paſs thorow, by their Irradiation, the impreſſed Motion. As to the Parts, within which the Animal Spirits dwelling, do carry thorow, as it were by Pipes and Dioptrick Glaſſes, the impreſſed Species of ſenſible things; they are the Fibres, Nerves, and the Oblong Marrow, and chiefly the tops of it, to wit, the ſtreaked Bodies. The Fibres being ſtretched forth in every Senſory, as it were Nets ſpread abroad, take the Particles of the Object, diffuſed and entring here and there, from which, whil'ſt the Spirits implanted in thoſe Fibres, are affected, and are marked with the type or ſhaddow of the Objected thing, forthwith the ſame Character being expreſſed; by a continued Series of Spirits, paſſes forward, thorow the little Pipes of the Nerves, and the Medullary Trunk, into the ſtreaked Bodies, and is there repreſented as upon a white wall; But the Rational Soul, eaſily beholds the Image of the thing there painted; or perhaps carried forward beyond into the Callous Body, the Imagination and Phantaſie being excited, But after what manner Brutes perceive themſelves to feel, and by reaſon of that Senſion, they either imprint it in their Memory, or draw forth the Acts of the Appetite, we have ſhewn elſewhere.

The Animal Spirits paſs thorow the ſenſible Species; and not the Effluvia of the Object, penetrate even to the head.

The bounds and paſſages, by which, and into which the Species paſs thorow.

The Number of the Senſes is well affirmed to be Five.

Concerning the number of the outward Senſes, we ſhall not recede from the vulgar Opinion, affirming them to be Five; for althô in ſome imperfect Animals, perhaps one Senſe or two are only found; and thô it may ſeem, that the more perfect living Creatures may exerciſe many more than Five; becauſe it is poſſible, that the Kinds of ſenſible things, far exceed that Number; yet it is ſeen, that thoſe Five Organs of the Senſes do abundantly enough ſupply the wants of all living Creatures: at leaſt it ſeems good to the great Creator, not to grant to Man more than theſe, nor perhaps better than brute Beaſts have obtained: Hence we may argue, that whereas the firſt Notions of all Simple things, are acquired only by the ſhowing of the Senſe, and that Man, notwithſtanding, is wont from thence to form Complicated Orations and Diſcourſes, beyond what Brutes are able to do, that this is done by the Virtue and Operation of the Rational Soul in him, of which indeed Beaſts are wholly deſtitute.

So many, and not more, are requiſite.

As to the Order or Method, by which we ſhould treat of the Senſes, particularly to be conſider'd, if their worth or dignity be reſpected, it is confeſſed by all, that Seeing, and then Hearing ſhould by right have the Prerogative; but indeed, becauſe Knowledge more eaſily, and always more happily, proceeds from more Known things, to things leſs Known; therefore, I think to begin with the Touch or Feeling, as the moſt Common Senſe; alſo for that the formal Reaſon of which ſeems to be moſt eaſily unfolded.

CHAP. XI.

Of the Senſes in Particular, and firſt of the touch or Feeling.

The Senſe of Feeling is more thick, but the moſt ample or large.

THE Touch or Feeling, thô it ſeems a Faculty of a lower Order, and as it were of a more groſs Nature, becauſe it apprehends not the object, unleſs it be brought near, and as it were preſſed with its Arms; yet in ſome reſpect, it is more excellent by far than the reſt; becauſe this Senſe beyond all others, receives and knows the Impreſſions of many ſenſible things, and thoſe inflicted with greater variety; and ſo obtains a moſt large, and as it were a general Province. For ſince that the Senſible Qualities ſo called, are manifold and divers, to wit, Heat and Cold, Moiſture and Dryneſs, Hardneſs, and Softneſs, and other Modifications of Bodies, their Make, Motions, Influences and Types, or Figures of Appearance, which in Concretes reſult from the mixtures and divorces, or the various Tranſpoſitions of the Elements, the greateſt part of them by much, are the proper Objects of Feeling, and are diſcerned only by its Judgment, and as it were by its Will. Further 'tis obſerv'd, That the Touch or Feeling, gives notes of Judgment to all the other Senſes concerning uncertain Objects: for when the Sight cannot diſtinguiſh a Ghoſt or Spectre, from a ſolid Body, by the tryal of Feeling, preſently the thing is put out of doubt; ſo likewiſe of the Smelling and Taſte, which oftentimes put away ſenſible things brought to them, and fear their near Embrace, unleſs firſt tryed by handling.

Exhibits Signs of Judgment to the reſt of the Senſes.

It hath a mighty diffuſive Senſory or Organ.

But this Power, as it enjoys great variety, as to its Objects, ſo it hath a moſt ample Senſory, and equally extended almoſt with the whole Body; That indeed few Parts, either within or without, but partake of this Senſe. Further, this Faculty, for that 'tis of a general and common uſe, inſinuates it ſelf into the Organs of the other Senſes, deſtinated to the private Office of every one: For both the Tongue and Noſtrils, alſo the Eyes and Ears, perceive heat and cold, hardneſs and Softneſs, and other tangible qualities, no leſs than their proper Objects. If that we ſhould further inquire, what the immediate Organ of Feeling is, in the ſeveral Members, or Parts? it may be ſaid, that it is the Nervous Fibres, every where ſtuffed, and as it were diſtended with a Company of Animal Spirits; which as the Strings of a Lute, as often as they are ſtruck by the ſtrokes of Tangible things, propagate the Impulſe every where received, by the paſſages of the Nerves, forthwith to the Common Senſory. For as ſuch Fibres being thickly ſet, are interwoven in the Skin, the fleſhly Pannicle, the Membranes, and Muſculous Fleſh, yea, and with ſome of the Inwards, ſo that the Approaches of outward Tangible things, are not only felt in the Palm of the Hand, or the Superficies of the Body, but as often as ſharp Humors are brought within into the Bowels, or that Preternatural Contents cauſe a pulling or hawling; a troubleſome Senſe of it is felt; wherefore the proper Organ of Feeling, is neither the Skin, nor the Fleſh, nor the Membranes, as hath been aſſerted after this manner by ſome, and after that manner by others; but the

Which are the Nervous Fibres.

In all the Parts, both External and Internal.

Fibres

Fibres are that Organ, implanted in the whole frame or make of theſe or thoſe Parts.

Althô many ſenſible Fibres are placed every where thorow the whole Body, alſo, thô there are divers and manifold Tangible qualities; yet it is not to be thought that theſe Fibres, that they may be the better fitted for thoſe qualities, are of a different Kind or Conformation; for neither are there ſome Fibres, by which heat, or others by which cold, or others different from either, by which other Tangible things are perceived; but the ſame Fibres, are every where alike, and receive and diſtinctly carry the approaches of every Object, for neither do the ſenſible Fibres, planted in divers places or parts, acquire a diverſity of Office, ſo that one Member ſhould be the Index of heat, another of cold, or another of a ſeveral Tangible thing, but every one indifferently feel almoſt all Tangible things, from every Fibrous Part. The reaſon of the difference is, becauſe the Fibres, thô of the ſame nature and frame, enter into divers ways of Contractions or wrinklings, from the various ſtrokes of ſenſible things; even as the ſtrings of an Harp, from the various ſtrokes of the Muſitian, give forth different Sounds; ſo alſo, the Fibres, which are the Inſtruments of Touching, are affected after a different manner, by the various impulſe of Tangible things. For it ſeems, that theſe are irritated or provoked one way, with heat, and another way with cold, and ſo from the reſt of the Qualities, after a manifold manner; therefore, the Animal Spirits implanted in them, enter into a peculiar way of Gyration or turning round, or of undulation or waving, according to which, the Spirits being harmonized, which flow within the paſſage of the Nerve belonging to thoſe Fibres, do propagate the ſame Figure or Type of their carrying forth, to the Medullary Stock, and by its means, to the Common Senſory.

Which Fibres, thô every where of the ſame Conformation;

Yet Exhibit various Species, according to the various approaches of tangible things.

The Tangible Species being impreſſed after this manner, on the Nervous Fibres, or the outward Organ of the Touch, are not always carried from thence, or at leaſt not immediately to the ſame Common Senſory; for we have ſhewed elſewhere, that ſome Nerves ſpring from the Parts of the Brain, and others from thoſe of the Cerebel; wherefore, when they direct the Impulſe, hap'ning outwardly immediately to the ſtriated or ſtreaked Bodies, theſe latter convey the Senſion from the Fibres, which are planted ſomewhere more inwards about the *Viſcera* to the Cerebel; from which (without Knowledge of the Animal) oftentimes involuntary Motions are retorted: as when Vomiting follows upon an Emetick Medicine, unknown, and againſt our Minds. If that this private Senſion belonging to the Cerebel be a little ſtronger, and vehement paſſing thorow the ſame Cerebel, goes further even to the ſtreaked Bodies; as when Medicines provoking the Stomach, more ſharply, induce a Senſion or trouble about the Heart, or otherways moleſtious, which they plainly give notice of.

Tangible Species immediately carried either to the Cerebel, or to the ſtreaked Bodies.

Further, when the Tangible Impreſſion arrives firſt and immediately at the ſtreaked Bodies, if the ſame be light, it is there terminated, and the ſenſible Species preſently vaniſhes; but if the Impulſe of the Object be ſomewhat ſtronger, it paſſes further to the Callous Body, and oftentimes to the Shell of the Brain; and therefore their Affections, Imagination, and ſometimes Memory, gather'd from the touch of the thing, ſucceed: and when, the ſenſible Species being alſo dilated to the Common Senſory, a divergency or bending down of the Spirits, from thence is reflected into the ſame Nerve, or others related to it, ſo it ſtirs up local Motions. Theſe ſort of Effects are ſufficiently known by the Common Proverb, *Where the Pain is, there the Finger will be*: for it is implanted by Nature in every Animal, to rub or preſs the place with its finger or foot, where any ſenſe of Trouble or Pain is.

And from thence goes forward, ſometimes to the other Faculties, Viz. the Imagination, Memory, and Appetite.

As to the Kinds and Differences of Feeling, both are taken, either from the Objects, or from the various affection of the Senſory: the ways or means of the former, are ſo manifold, that they cannot eaſily be recounted; for hither ought to be referred (as we ſaid but now) the univerſal Tangible Qualities; By Tangible Qualities we underſtand here, the various habitudes of Natural Bodies, which ariſe from the Craſis and Diſpoſition of the Elements, of which they are made; as alſo from their Inteſtine Motion, or Effluvia's variouſly appearing in themſelves; which kind of Modifications of Bodies, the Senſe of Feeling chiefly finds out, and makes their knowledge or marks ſo certain, that when we do not believe the Scrutiny of the other Senſes, we are wont to reſt ſatisfied with the Examination of this.

The Kinds and Differences of Feeling, are either, In reſpect of the Object;

Concerning the Species of Feeling, Conſtituted in reſpect of the Senſory, we ſhewed even now, that the ſenſible Impreſſion was immediately derived from the External Organ, either to the ſtreaked Bodies, or to the Cerebel: Therefore, for that Reaſon, Senſion is either manifeſt, and knows plainly every thing, or private of which the Animal is ſcarce knowing: but the Conſequence declares this Kind of Senſion to have been ſtirred up: for a Motion being made in any inward unſeen, argues a previous ſenſe of it to have

In reſpect of the Senſory.

And ſo it is either manifeſt or private.

have been; as from the change of the Pulſe, or a failure of Spirits, ſhews a certain Malignity to have affected the *Præcordia*, or the Cerebel.

Pleaſant or Sad.

In either of the aforeſaid Kinds of Senſion, to wit, whether the ſame be manifeſt or private, the Tangible Impreſſion, either coming pleaſantly to the Fibres, gathers together the Spirits implanted in them, and more nearly delights them, and ſtrokes them with a ſoft and gentle rubbing, whence pleaſure ariſes; or the Impulſe of the ſame, pulling and wrinkling the Fibres, diſtracts and diſſipates the Spirits one from another, and ſo Grief, Pain, or Trouble Succeeds: But concerning theſe Affections, *viz.* Grief and Pleaſure, we ſhall have hereafter a more fit place to ſpeak of them; ſo that it next remains, for us to proceed, from the Senſe of Feeling, to its neareſt Neighbor and Relation the Taſte.

CHAP. XII.

Of the Taſte.

The Taſte a Kin to Feeling.

THe Taſte is ſo like to the Senſe of Feeling, that it ſeems to be a certain Species of it; and certainly the Object, in either Organ, ought to be brought near, and laid upon it; yea in taſting, to be admitted more deeply within the Pores and its paſſages. Upon this Senſe, depends chiefly both the Life and Vegetation of Animals; for this chooſes and takes in Juice for nouriſhment convenient, and that by this Office it might be conſtantly and rightly performed, it is furniſhed with a faculty, or a certain implanted Judgment, whereby ſome wholeſome and agreeable Aliments, fit for every Individual, are diſcerned from thoſe that are diſagreeable and hurtful; alſo further, as it were in reward of its work, it is delighted after a notable manner, with the Exerciſe of its Function; For unleſs convenient agreeable things, fit to be Eaten, move Spittle, and as it were prickle them with a moſt grateful pleaſantneſs of Taſte, the appetite of deſiring or taking of Food is quickly extinguiſhed, with oblivion or tediouſneſs; ſo for the preſerving the Individual, no leſs than the Species, Deſire and Pleaſure ought to be had.

The Senſory of the Taſt diſcerns its Objects, and is delighted with thoſe things that are Convenient.

Venus or Pleaſure is neceſſary for the preſerving of the Individual.

The Senſory of the Taſte is not ſo diffuſive, and almoſt Co-extended with the whole Body, as that of Feeling, but is limitted to one part only: yea, and its Senſible is of one Kind only, to wit, a Savoury thing, nor does it include, as the Tangible Quality, the Subjects of many Catagorical things. Indeed the chief and almoſt only Organ of the Taſte is the Tongue; to which, after a manner, but obſcurely, do conſent the Palate and the Upper part of the Throat; But in all of them, the Nervous Fibres are the immediate Inſtruments of Senſion; wherefore 'tis obſerved, that the Tongue is notedly more Fibrous than any other part, alſo conſiſts of a very porous Contexture; for this end, that the ſavory Particles of the thing, might be more plentifully, and more deeply admitted, into the paſſages of the Senſory, and ſo meeting at once with many Fibres, might excite a more acute Senſion: yea, it may be ſuſpected, that whil'ſt the ſubtil Particles of the ſavory Humor are imbibed ſo deeply by the Tongue, the Animal Spirits do in ſome meaſure ſnatch the ſame, for their nouriſhment, and convey them inwardly, by the paſſages of the Nerves, towards the Brain; for it plainly appears, that in great Faſtings or want of Food, and ſwouning or failure of Spirits, that a refreſhment of them immediately follows, upon the firſt taſting of any noble Liquor.

The Organ of the Taſte, is the Tongue, with the Palate, and Throat.

Eating is a certain Solution;

Eating is a certain Kind of Solution, whereby the ſavory Particles may be the better taken in, from the Food by the Senſory: Becauſe, whil'ſt ſolid eatable things are reduced into bits, by Chawing, the Tongue, and other parts of the Mouth, and Throat, pour forth as it were a certain Menſtruum, which waſhing and as it were Elixivating the ſavory little Bodies, carries them into the Senſory, and inſinuates them into the Pores of the Tongue: Further, The ſavory Particles, becauſe ſo impacted in the Senſory, do employ its paſſages, hence it comes to paſs, that one ſavour not rarely excludes another; ſo ſweet things being taſted, becauſe they are clammy, and very obſtructing, hinder or pervert the more exact taſte of Wine; wherefore, that the hindred Faculty might be again reſtored, ſalt or ſharp things are eaten, which may open the Pores of the Tongue, and clear away the ſticking Viſcouſneſs.

Wherefore one ſavour, oftentimes excludes another.

As to the Nerves, which serve to the Fibres of the Tongue, thickly interwoven with it, and which carry the Impressions of Savours, to the chief Sensory, it seems, that they are of a double Kind: for as Nerves are inserted in the Tongue from both the Fifth, and the Ninth pair, and are every where distributed thorow its whole frame, with a most thick Series of shoots, it is very likely, that they are both Sensitive. Concerning the Nerves sent hither from the Fifth pair, the thing is out of doubt; and as from the same pair, other shoots are sent into the Nostrils, hence we may say, the reason is, of that Consent, which is between both these Sensories; but indeed, as to the Nerves bestowed also on the Tongue, from the Ninth pair, it may be something doubted, because it is commonly believed, that the Office of these serve to the Motion of the Tongue, and to Speech; wherefore, from the same pair are sent certain branches into the Muscles of the Tongue, and of the Bone called *Hyoides*, which without doubt are destinated for their Motion: Nevertheless, tho it be granted, that the Nerves of the Tongue and its Appendix, inserted from the Ninth pair, do bestow on them the moving Power (which indeed is necessary to this Part, as well for Tasting as for speaking; to wit, as the Tongue is very versatile, it takes in with delight the Savours from every corner or recess of the Mouth) yet what hinders, that however the same Nerves should not serve for both, to wit, Motion and Sense? For it appears, that many Nerves which serve for the Sense of Feeling, do in like manner serve for the performing of the Motions of those Parts to which they belong. Wherefore, as Tasting is a certain Species of Feeling, it is probable, that it enters in some measure through the moving Nerves of the Tongue it self; neither does it appear otherwayes, for what end Branches of the Nerves, derived from the Ninth pair into the Tongue, disperse such thick-set shoots into its whole frame, unless they should serve for the receiving of the Particles of Savours, coming from every Part. But for as much as after this manner, two Nerves of a distinct Original belong to the Tongue, and one of them arises from the Parts of the Brain, and the other from the Cerebel: Hence a Sension being carried inwards by the same, it is stay'd from either at the Common Sensory, and so according to the diverse Nature of the Object, a pleasant and delectable fruition, or an ingrateful and sad Aversion, at once in either Government the Imagination and the *Præcordia* are affected.

The Nerves sent to the Organs of the Taste, proceed partly from the Fifth pair.

Partly from the Ninth also, which serve for the Motions of the Tongue.

It is in like manner observed of the Touch, that the same Nerves serve both for Sense, and Motion.

Wherefore from the Taste of a pleasant thing, the Imagination and the Præcordia, are wont to be affected.

There is a sufficient indulgement to the Taste, for a reward of its necessary work, to wit, Eating; therefore its Objects are sought far and near, through the Regions of the whole World, yea and all the Elements are imployed. Further, as to its Ministry, all the rest of the Senses serve to this, for nothing pleases the Palate unless the Sight, and Hearing, Smell, and Touch approve it. 'Tis fit it should be so, for this Sensory, by which Food is conveyed for Humane Life, and that it might enjoy great variety, for the shunning of nauseous things; and use a guard upon the rest, for Discrimination; lest instead of Food, it might unawares take Poison.

The rest of the Senses, wait upon the Taste.

The Speculation of Savours, (which are the next Object of Taste) contains in it self very many Pleasant, and no less Profitable things; wherefore I think it will not be from the Matter, to turn aside here a little into this Theory; and as we shall divide all Savours into Simple and Compound: First, we shall rehearse what Nature suggests of that Kind particularly, according to their several differences, both of themselves, and of the Subjects in which they are; Then Secondly, we shall add the Parallels, by what means, and by what service of Art, the same Savours in Subjects are produced anew, in which they are not by Nature; Thirdly, After what manner Savours both Natural and Artificial, are any way altered and changed in their Subjects, or wholly perish. It will be worth our while to discourse briefly concerning these, and lastly, somewhat of Compounded Savours.

Savours the Object of Tasting. Simple or Compound: A threefold Consideration of them, to wit, which are, 1. Whose Original is natural. 2. Artificial. 3. The Alteration or Abolition of either.

Savours called Simple, are commonly counted to be Nine, *viz.* Sharp, Bitter, Salt, Acid or Tart, Astringent or Biting, Sowre, Sweet, Oyly, insipid or without Taste.

Nine Simple Savours.

The first is sharp or biting Savour, such as is felt in Pepper or Pellitory, being chewed; which probably arises, as often as the Particles of any Body are smooth, and sharpned, and after that manner figured, like the stings of Nettles, that they may prick and very much dig into the Sensory. In Subjects indued with a sharp biting Savour, a volatile Salt, or an Alchalisat, or suffering a Flux from Fire, very much exceeds other Elements.

Sharp Savour.

First, Concretes, which have by Nature Particles so figured, are accounted among Vegetables Hearts-ease, or Trinity-Herb, Pepper, Aron, Country-Mustard, Sea-Lettice, or Milk-thistle, Mustardseed, Pellitory, Ranunculus, *&c.* Of Minerals Arsneck, Sandarach, *&c.* Among Animals it is scarcely met with, nor among their Parts, a savour of this Kind, unless perhaps some Insects, as Cantharides, *&c.*

1. Which are sharp or biting of their own Nature.

Secondly, Sharp biting Bodies produced by the help of Art, are Mercury Sublimate, Butter of Antimony, Strong-Waters, and Caustick; the fixed Salts of Herbs, made by burning to Ashes, Calcined Vitriol, the Rust of Brass, *&c.* The other things suffer Calci-

2. Which are so produced by Art.

Calcination, and Fusion in the Fire, the more biting sharp they are made; because, by this means, the Pricks and Spears of the Particles are sharpned. An Example is in the fixed Salts of Herbs, calcined Vitriol, the Infernal Stone, *&c.* Bodies which are biting sharp, and Corrosives mixt together, and committed to the Fire, acquire a most sharp force of burning. An example is in Mercury Sublimate, and Stygian Waters, the reason of which is, because Salts of a like Kind, being mixed together, joyn their forces or edges, and are at the same time very much sharp'ned by the fire. It happens otherwise to Salts of a divers Kind, as are Spirits of Vitriol, and Salt of Tartar, mixed together; Sugar and Honey subjected to distillation, exhale a Caustick Water; also the Spirit of Wine highly rectified becomes biting sharp, and burning; because the Saline or Spirituous Particles, in both Substances being deprived of the sweetness of the others, put forth their Spears and Pricks.

3 By what means the biting sharpness is wont to be taken away, or altered.

Thirdly, Which was the Third Proposition, the biting sharpness in Bodies, both Natural and Artificial is put away or altered after various wayes. *Mercury* Sublimate highly Corrosive, if another quantity of live *Mercury* be added and sublimed, it takes away all acritude or biting sharpness, and it becomes insipid or without taste. The reason of which is, that when the Particles of the added *Mercury*, do grow to the little Spears of the Salts, they do thereby become more thick and obtuse. The Spirit of *Vitriol* and Salt of *Tartar*, being melted (which two are biting sharp and corrosive of themselves apart) if they be put together, lose all acritude; to wit, these Salts being of a divers Kind, *viz.* Fluid and Alchalisat; being put together, work mutually one upon another, by which means, the little Spears and Pricks of both are broken; even as if the edge of one Knife, should be rubbed against the edge of another. Plants and Herbs, which are naturally biting sharp, if they be macerated in White-wine, (or perhaps in any other Liquor) put away all their sharpness; and yet the Liquor becomes not at all sharp. In these sort of Concretes, all the acritude depends upon the volatile Salt, which being loosned, by the mixture, presently flyes away. For the same Reason, these sort of Herbs, being subjected to distillation, exhale almost an insipid water, and the dreggs of the Herbs remaining after distillation, is also insipid: Hence also some Herbs, which being green, abound with a sharp biting juice, being dryed, lose very much of their acritude; as Scurvy-grass, Water-cresses, and Brooklime, *&c.*

2. Bitter Savour.

Secondly, The bitter Savour or Taste, such as is principally in Gall and Wormwood, seems to be made, for as much as the Particles of its Body are planted with forked Pricks, which digging into the Sensory, not deeply, but only on the Superficies, cause a sad or sorrowful Sense; just as if the sharp-pointed fruit of the Teasle, should be sharply handled with ones hands. In Subjects indued with a bitter Savour, Salt, associated with Sulphur, and suffering an Adustion with it, Predominates.

1. Which are bitter of their own Nature.

First, Subjects which exhibit this kind of Savour naturally, among Vegetables, are Wormwood, Southernwood, Centaury, Colocynthida, Agaric, Fumitary, and almost all Herbs which grow in dry and mountany places; then Gumms, and Concrete juices, as Myrrh, Aloes, Opium, Ammoniac, *&c.* Among Minerals they are not easily met with. The Excrements of living Creatures, as the Gall, and Dung, the Liquor contained in the Bladder of the Gall; and so the Skins of some Birds are bitter.

2. After what manner, the bitterness may be produced anew.

Secondly, As to the second, Things which draw bitterness anew, they are Compounded Liquors; if in Cooking they are burnt, or are made too thick by Evaporation; hence Soot is bitter, and whatever things suffer adustion or burning. Sugared Aliments and sweet things are most easily Corrupted in the Stomach, and degenerate into a most highly bitter Humor.

3 By what means it is wont to be taken away, or altered.

Thirdly, As to the Third, a bitter Savour is most difficultly taken away, without the Destruction of the Subject, in which it is; as appears in Aloes, and Colocynthida, and Medicines prepared out of them. Yet New Beer, being something bitterish, by the boyling of Hops in it, grows sweet by clearing and a long fermentation: the reason of this we have shewed elsewhere. Further, Liquors, which grow bitter by reason of their Contracting an *Empyreuma* or burning to, if they be exposed for a long while in a moist Air, or distilled over again, mixed with Calcined Salt, they will partly lose their *Empyreuma*, or smatch of Fire, and bitterness.

3. Salt Savour.

3. Because Experience shews, that Salts for the most part do grow together, into many pointed, and diversly corner'd Figures, it is most likely, that the Salt savour is produced, when Particles of any Body, pointed with many Angles and Edges on all sides, do as it were cut into the Sensory, like as if little bits of broken Glass be strictly pressed in ones hand. In these Kind of Subjects, the Saline Principle excells the other Elements.

Salt things naturally.

First, Bodies naturally Salt, are scarce met with in the family of Vegetables, altho Plants and Herbs, almost all, owe their rise and growth to Salt. It is seen however that

that Sea Scurvigrass, and Capers have something of a salt Savour. Salt obtains the chief place among Minerals, and salsitude or saltness is chiefly eminent in Sea-Salt, in Salt that is dug up, Nitre, and Sal Gemmæ. The Excrements of Animals, to wit, the Dung, the Swet, the Serum, are Salt; Blood also participates something of the Nature of Saltishness.

Secondly, Those Salts which are made by an artificial means, are the fixed Salts of Herbs, made by incineration or burning to Ashes: Compounded Salts, to wit, Borax, Sal Ammoniac. A volatile Salt is drawn forth of Amber, Bones, Horns, and also out of the Blood of Animals, by Sublimation. *2. Things which are so made by Art.*

Thirdly, As to the Third, all natural Salts, if they be distilled often over again, pass into acetous or tart Liquors: The reason of which is, because these kind of Concretes suffer a divorce of the other Principles, by the fire, and so come more near to the Simple and Elementary Nature of Salt. Volatile Salts, at first white, if exposed to the Moisture of the Air, do melt into a reddish Liquor, not very Salt, and besides smelling like the stink of smoak or soot; because the mixture being loosned by the moist Air, the Saline Particles, for that they are volatile, many of them fly away, but in the mean time, the Sulphureous Particles, before subjugated, get the Dominion. *3. By what means saltness is wont to be taken away or altered.*

Fourthly, The Acid, or sour, or tart Savour or Taste, seems to be made, when the Particles of any Body are four pointed or corner'd (to wit, which appear with a smooth and acute point, and with a sharp Body, like a wedge made into a bigger bulk) so that which way soever applyed to the Sensory, they prick it, and by pressing it, something bind it up; and therefore they leave in it larger Incisions than any other Savour. This Kind of Savour, for the most part depends upon a fixed Salt, carried forth into a Flux. *4. The Acid or tart savour.*

First, Bodies naturally acid or sower, are among Vegetables, Pomecitrons, Oringes, Lemons, Berberries, Sorrel, Tamarinds, *&c.* Among Minerals scarce any to be met with, as I remember, nor is it easily to be found among Animals, unless perhaps the Melancholly Juice, the ferments of the Stomach, and Spleen, the Pancratic Juice, and also the fasting spittle of a Man, may be said to be something Acid. *1. Natural Acids.*

Secondly, Made Acids, are Vinegar, and the Spirit of it, or the Liquor distilled: The Melancholic Humor preternaturally begotten in the Body, which often like the Spirit of Vitriol, becomes Acid, and almost Corrosive. Vitriol, Salt, and Sulphur, being whole, and tasted in their solid substance, shew no kind of acidity, if they be made subject to Chymical Operation, send forth a Liquor highly acid; the reason of which was shewed but now. *2. Made Acids.*

Thirdly, As to the Third, Chymists say, that acetous Spirits, to wit, of Sulphur, Salt, Vitriol, *&c.* by a long Digestion and Circulation, do grow sweet. All acetous Mineral Spirits, also distilled Vinegar, and the juice of Vegetables; if they dissolve any Body, by knawing or corroding it, as Corals, Pearls, or any Precious Stones, put away their acidness; because the Particles of the fluid Salt, in the acid Stagma or Menstruum, are fixed to the *Alchali* Salt in the mixture. Moreover, these Kinds of Spirits, and acetous Liquors, if they are mixed, either with Oil of Tartar, or with the fixed Salts of Herbs, loosed by Deliquium, loose their acidity. The Spirit of Vinegar being poured upon Salt of Tartar, and drawn off by distillation, becomes insipid. Spirit of Vitriol poured upon Quick-silver, and drawn off by distillation, putting away its acidity, acquires a taste like Allum; and if we may believe *Helmont*, passes by Coagulation into true Alum. Distilled Vinegar impregnated with the solution of *Minium*, or red Lead, grows wonderfully sweet. *3. By what means an Acid savour is wont to be taken away, or altered.*

5. The Sower, austere, or binding or astringent Savour, arises in Bodies, whose Particles are stuffed with very many little Spears and Hooks, which in chewing, being rolled upon the Sensory, are fixed to it, and greatly draw together, and pull its Fibres; not much unlike, as if a Comb, which Cards Wool, should be drawn up and down upon the hands. In substances indued with an austere savour, a fixed Salt, enwrapped with the Particles of the earthy Element, predominates. *5. Austere or sower Taste.*

First, Bodies naturally austere, among Vegetables, are the Fruit of the Medlar-Tree, of the Dog-Bryer, of the Cypress-Tree, Flowers of Pomegranat, Galls, Slows, Sumach, *&c.* Among Minerals Alum, Iron, Vitriol. Among living Creatures, or among their Parts, there is not as I remember, any austere savour to be met with. *1. Naturally austere things.*

Secondly, Bodies Artificially produced, which have an austere, sower or rough savour, are all made Vitriols, to wit, the Vitriol of Silver, of Steel, of Tin, of Copper, *&c.* The reason of which is, because in these Minerals, the Saline Particles, are very much intangled with Terrene, and they continue in the same state, when they are *2. Made austere savours.*

drawn forth from their Subſtances, by the ſoluted Mixtion. Spirit of Vitriol being drawn from Mercury, by frequent Cohobations, acquires a Pontick or Aluminous Savour.

3. By what means an auſtere or rough Taſte, is wont to be taken away, or altered.

Thirdly, As to the Inſtances, by which an auſtere, ſower, or rough taſte, may be taken away out of all Subſtances, it is to be obſerved, that Vitriol of every Kind, by long diſtillation and circulation with the Spirit made of Wine, grows ſweet, and loſes its aſtringent force. If waters impregnated with Vitriol, be poured into Oil of Tartar, there will be precipitated a certain thickiſh Matter wonderfully ſweet. Steel, Tin, or Lead, being diſſolved in Vinegar, and Coagulated by Evaporation, go into ſweet Salts. Further, it is a common Experiment: If having before taſted Vitriol, you take the fume of Tobacco at your Mouth, the auſtere taſte at firſt impreſſed on the Senſe, is changed into a plainly honied ſweetneſs; the reaſon of which is, becauſe the Sea-ſalt Particles, ſuch as are in Vitriol, being mingled with the Sulphureous, out of the burnt Tobacco, create a ſweet Savour: from whence alſo we may Collect, that Sugar and Honey, are of a Sulphureous-ſaline Nature; which alſo clearly appears, by their diſtillation, for as much as they, like Salt Minerals, yield an Acid and very Corroſive Stagma.

VI. A ſower Taſte.

6. Of Kin to the auſtere, is the acerb or ſower taſte, the Particles of whoſe ſubject, are indued with little Tenters or Hooks, or Claws, but which are more dull and blunt, and with which they ſtrike the Senſory, and ſtop up its little Pores, and being once fixed, they are not eaſily removed; whence a ſtupor or numneſs in the Teeth and Palat is cauſed; not unlike Burdocks, which being fixed to the Skin, become troubleſome, and are not eaſily ſhaken off. In acerb or ſower biting Bodies, a fluid Salt, implicated with an earthy Matter, excells.

1. Bodies naturally acerb or ſower.

Firſt, Bodies naturally ſower among Vegetables, are unripe Fruits; as Grapes, Pears, and Apples, and moſt of all Wildings, Crabs, or wild Apples, thô kept till they are mellow: alſo ſower Herbs: Among Minerals, or Animals, there is nothing eaſily to be met with, that has a ſower Taſte.

2. Made ſower things.

Secondly, Bodies that are made ſower anew, are chiefly Wine and Beer, degenerating into a deadneſs, through Age or Thunder; alſo Leaven, or Bread too much leavened. Broths and Milk-meats, if they Contract a ſettlement and hoarineſs, become ſower: becauſe in all thoſe Concretes diſpoſed to Corruption, the Saline Particles being exalted, and tending towards a Flux, carry forth alſo earthy Particles involved with themſelves.

3. By what means the ſower Taſte, is wont to be taken away, or altered.

Thirdly, As to the taking away of this Taſte, we have obſerved, That ſower Fruits do grow ſweet, either by the goodneſs of the Air, and Sun; in ſower Fruits brought to maturity: or by the goodneſs of the Ground or Soil, as when wild Apples tranſlated to a good Soil grow ſweet; the reaſon of either is, becauſe the Spirituous and Sulphureous Particles before ſubjugated, at length Predominate over the Saline. If Wine degenerated into deadneſs, is impregnated with new Lees of *Tartar*, it ſhall recover its Vigor: The like happens, if a Can of good Wine be poured into a Veſſel of ſower Beer or Ale. Wine growing dead, if it be diſtilled, often yields a ſweet Spirit, and in no leſs quantity, than if the Wine had been in its full ſtrength: becauſe the Spirits before ſubjugated in that Mixture, recover their Dominion by diſtillation.

VII. The ſweet ſavour.

Seventhly, The ſweet ſavour ſeems to be made, for as much as the Particles of any Body are ſo figured, into ſoft prickles, that they tickle the Senſory, with a ſoft rubbing, and from thence ſtir up a delightful Senſe of Pleaſure; like as if feathers were applyed to the Sides, or the Soles of the Feet. In theſe the Saline Principle ſeems to be aſſociated, with Sulphureous and Spirituous, and when they are, in like manner are carried forth.

1. What are naturally ſweet.

Firſt, Thoſe which are naturally ſweet, are among Vegetables, firſt Sugar, and Manna; then Caſſia, ripe Fruits, Grapes, Raiſons, ſome Roots, as Parſnips, *&c.* Among Animals, ſome aſcribe Honey, but others more rightly, ſay that is ſwet out of Plants, and gathered by Bees. Among Minerals nothing (that I know) hath naturally a ſweet Savour.

2. Sweets prepared by Art.

Secondly, The things which have a ſweet Taſte, and are made by Art, are the Sugar of Lead, Salt of Steel, Lythargires, yea, and out of many other Bodies, Vinegar extracts a ſweet Salt. Taſting Vitriol before-hand (as was ſaid) and then taking a Pipe of Tobacco, the ſmoke grows ſweet like Honey. In this, and in the former inſtances, whilſt the Saline little darts grow to the Sulphureous Particles, or Saline of another Kind, both of them become more blunt. An *Alchaliſat* Spirit, and the fixed Salt of any Body, being mixed, and circulated by a long digeſtion, acquire a ſweetneſs. Barley ſoaked in Water, when it begins to ſprout, and dried with a gentle fire, grows exceeding ſweet: And Wheat in like manner alſo, if being wet, it ſprouts yields a wonderfully

ſweet

sweet Meal; the reason of which is, because by that Artifice, the Sulphureous and Spirituous Particles, overthrown by the Earthy, get their Liberty.

Thirdly, There are many Instances, by which sweetness is abolished; for all sweet things too much boiled, grow bitter. Sugar or Honey, by distillation, yield at first an insipid Phlegm, then sharp and burning Spirits; In the dead Head remaining after distillation, is a burning Salt, and an insipid Earth, and whatever is sweet perishes. Further, Sugar or Honey being mixed with a great quantity of Common Water, and distilled through a Bladder, yield a burning Water, like the Lees of Wine distilled after the same fashion. In both these, and in the following Instance, the additional sweetnesses are bruised, by the saline little darts, Sugar of Lead being fused by the fire, melts into meer Lead; if it be distilled in a Retort, if we may believe *Beguinus*, it will produce a burning and sweet smelling Spirit.

3. *By what means sweetness is taken away, or altered.*

8. The unctuous or oyly savour, seems to be produced, when the Particles of any Body are very Spherical and round, which neither hawl, prick, nor tickle the Sensory, but only stroke it with a gentle and soft coming to it. In these, the Sulphureous Principle predominates.

VIII. An Oyly Taste.

First, Bodies naturally Unctuous or oyly, among Vegetables, are ripe Olives, the Turpentine-Tree. The Larix, and some sweet smelling Gums naturally sweating forth. Among Minerals, Asphaltum, Bitumen, Amber, Sperma Ceti, and some fat Earths, and Ochers: Of Animals, and their Parts, the Sewet, Marrow, and Fat.

1. *In which it is by Nature.*

Secondly, Unctuous things prepared by Art, are Butter, Cream, Oyls, press'd out of Fruits and Seeds, as Oyl of Nuts, of sweet Almonds, also Oyls drawn out of Seeds, Woods, Gums, and Resines by distillation.

2. *In what things it is wont to be produced by Art.*

Thirdly, Altho unctuosity is most difficultly taken away from the Subjects, yet it is wont to be lessen'd: for so Unctuous Bodies, if they grow stale, or are too much boiled, or otherways grow hot by shaking, losing their smoothness, become rank, and prick and dig the Sensory. Further, Sewet and Fat, if they be long exposed to a moist Air, contract a settlement, and become hoary, and then are resolved into Water, and a corrupt Earth. In this, and in the former instance, whil'st the mixture of the Body is resolved, some Sulphureous Particles fly away, in the mean time the remaining lose their Dominion.

3. *How it is taken away or alter'd.*

9. An insipid Savour or Taste, seems to be made, when the Particles of any Body, are indued with superficial little Darts, not at all sharp, but smooth and discharged; which enter not into the Pores of the Sensory, and no ways dig or hawl it. In these, the Principle either of Water, or Earth, predominate over the rest.

IX. An insipid Savour.

First, Bodies naturally insipid or tastless, are Common Water, especially Rain Water, some cold Herbs, the raw white of an Egg, *&c.* Altho in the whole world, there is nothing insipid simply, yet Speech is wont to apply it to them things, in which some one of those Savours, are not eminently, which we have before recounted.

1. *In what things it is by Nature.*

Secondly, That Savory things may become Unsavory, the more acute Particles ought wholly to fly away, or be very much broken. Herbs long kept, also many more things, if they be distilled by a moderate heat, yield almost an insipid Liquor.

2. *How it is wont to be produced.*

Thirdly, Insipidness it self, sometimes is taken away; for insipid Water, if it stand long, that it putrifie, acquires a stink and mouldy Savour: The white of an Egg boiled hard, has something a sharp taste. In these kind of Instances, some active Elements, being before subjugated, get strength.

3. *By what means it is taken away.*

Besides these Kinds of simple Savours, which are as it were the Elements of the rest, there remain yet many Complications of these simple ones, as the Savours rehearsed are conjoyned one among another: And for as much as by the Wisdom of Nature, to satisfie all Palates, and by the Luxury of Art, that she might please the Throats of some, manifold mixtures of Savours have been produced, that almost nothing to be eaten, is found simple and without Sawce or Condiment. The several Compositions of these, is a thing almost impossible to enumerate; it shall suffice for the present, that we note some of the more noted Conjugations, and their Affections, as they are grateful or ingrateful to the Palate.

Compounded Savours.

The first Conjugation, and that most grateful to the Palate, is of acid and sweet, of which sort are generous Wine, Confections prepared out of Citron, Wood-Sorrel, Berberries, *&c.* Sugar'd things, and sharp things pickl'd, with Sugar. Secondly, Sweet and Astringent, as also sweet and sower, are well Consociated: as in Marmalade of Quinces, Candied Bulloes, Cyder drunk with Sugar, *&c.* Thirdly, Sweet and oyly yield a grateful Savour to the Palate, but that brings a nauseousness to the Stomach, as in Milk-meats, Sugar'd-meats, and Pasty-crust, *&c.* Fourthly, Sweet agrees not with biting, bitter, or salt Savour. Fifthly, nor doth a bitter Savour of it self, agree with any other: it is grateful to the Palate, well-tempered with the sweet. Sixthly, Salt-

Compositions of Savours, which are more or less grateful.

ſavour beſt agrees with the biting ſharp, as in fleſh ſeaſoned with Salt and Pepper, it is an ingrateful Sawce with the oyly. Seventhly, The Acid, Aſtringent and Sower, are well aſſociated with the ſweet, not with the reſt.

There are more Kinds of ſome other Compounded Savours, which we have no time now to recount. But there are in reſpect of the Taſte, as the Compounded Tunes of Harmony in reſpect of Hearing, in both ſenſible not ſimple Species of one Kind, but are carried manifold, and variouſly Complicated to the Senſory. It now remains for us to paſs from the Taſte, the Object of which we have largely handled, to the other Species of the Senſes.

CHAP. XIII.

Of the Senſe of Smelling.

IT ſeems that the Smell is a more Excellent, and a little more Sublime Faculty, than either Taſting, or Touching; to wit, becauſe its Object is more ſubtle, and comes to the Senſory, with a thinner Conſiſtency: for there is no need to put upon the Organ, the more thick ſubſtance of the mixture; but it ſuffices, that the Effluvia's or Breath, ſent from odorous Bodies, thô at ſomething a remote diſtance, be inſpired into the Noſtrils, together with the Air.

The uſe of the Smell, to diſcern Aliments at a diſtance.

Living Creatures are furniſhed with the Senſe of Smelling for this end, to wit, that agreeable and wholeſom Aliments may be known, and diſcerned from diſagreeable and hurtful; for becauſe it were an incongruous and dangerous thing, to take in preſently into the Mouth, all things offered to be eaten, and to be examined by the Taſte, leſt perchance Venomous and Stinking things, careleſly taken in by the Palate, ſhould bring loathing or hurt to it, the Smell examines firſt the thing at a diſtance, and refuſes thoſe rotten things, or guilty of any other very infeſtous quality, without receiving any hurt by the Contagion.

This is more excellent in Brutes than in Man.

This Kind of Primary uſe is ſeen more excellently in brute Animals, than in Man; for they by this Index only, moſt certainly know the Virtues of Herbs, and of other Bodies, before unknown, yea hunt out, and eaſily find their abſent Food, thô hidden from them, by the Smell. But that the Noſes of Men are leſs quick or ſagacious, it ought not (as ſome would have it) to be aſcribed to the abuſe of the Faculty, but the Cauſe lyes in the defect of the Organ it ſelf; for this is not ſo accurately required for the diſtinction of Humane Food, where Reaſon and the Intellect are preſent: For that Reaſon the inferior Powers in Man, exiſt leſs perfect by Nature, that there might be a place left, for the exerciſe and dreſſing of the more ſuperior.

The Organ of the Smell deſcribed.

As to what belongs to the Organ of Smelling, we have largely enough unfolded it in our Diſcourſe of the Nerves; to wit, we have ſhewed, that within the Caverns of the Noſtrils, are placed tubulated Membranes or like Pipes, which contain ſenſible Fibres, moſt thickly interwoven. Into theſe Membranes, very many ſmall Nerves are ſent from either Mamillary Proceſs, paſſing thorow the holes of the Seive-like Bones; but thoſe Mamillary Proceſſes, as they are plainly ſoft Nerves, ariſe in the Medullary Trunk, nigh the ſtreaked Bodies; wherefore, when the odorous ſteams, ſtrike upon the Fibrous, and very ſenſible Membranes, forthwith an impreſſion of the ſenſible thing, is carried by the paſſage of the Nerves into the Mamillary Proceſſes, and from thence into the ſtreaked Bodies.

Further, We have formerly declared, why the Smelling Nerves, divided without the Skull are harder, but united within it are not only ſofter, but alſo tubulated or like Pipes, and for the moſt part in Brutes, filled with clear Water: There is no need to repeat it here again, nor what we have declared there, concerning other Nerves, coming from the Fifth pair, and inſerted alſo into the Organ of Smelling: Of which certainly the Office is, to cauſe a certain Sympathy and conſent of action, between the Smell and Taſte, and ſomething alſo between the Sight and it.

Nerves of a ſeveral Kind, ſerve for Smelling.

I know ſome attribute the office of Smelling altogether to theſe Nerves, ariſing from the Fifth pair, denying it to the Mamillary Proceſſes, and from hence they render a reaſon, not only of that conſent, between the Noſe and the Palate, from whence it comes to paſs, that the ſame Objects are embraced or refuſed, but alſo, wherefore it happens, that one Senſe being loſt, that oftentimes the other periſhes; to wit the Cauſe of this

they

they ſay is nothing elſe, than that both Senſories do borrow the branches of their Nerves, from the ſame Trunk of the Fifth pair. But this Objection is eaſily overthrown, becauſe the Nerves of a twofold Original, are beſtowed not only on the Senſory of the Smell, but alſo of the Taſte. For the Tongue receives more and greater Branches from the Ninth pair, than from the Maxillary Trunk of the Fifth pair: to wit, that if the Nerves of one Kind be obſtructed, the Animal Function may be performed, by thoſe of the other Kind. Concerning this then we may ſay, that the Principle Nerves ſerving to the Organ of Smelling, are derived from either Mamillary Proceſs, alſo, that the Nerves on which the Senſe of Taſting chiefly depends, are ſent from the Ninth pair: Nevertheleſs, ſome ſecondary Nerves, or that are as it were taken in, are diſtributed to either Senſory, (as alſo to the Eye) far fetch'd from the Fifth pair: for this end, that there might be an affinity or mutual reſpect, between the Taſte and the Smell, and between both and the Sight: hence therefore the Taſte almoſt admits of no Object, unleſs that the Smell firſt approves of it: but both Faculties do require, that ſenſible things do firſt ſtand to the examination of the Eyes.

Hence the reaſon is had, of that Conſent, between the Smell and the Taſte.

But that the loſs of one of them, oftentimes brings in the defect of the other, as it is ſometimes obſerved in a Poſe, or Stopping of the Head, that loſing the Smell, the Taſte is loſt alſo: the reaſon of it is, becauſe either Senſory, being planted near, are both at once overthrown by the ſame ſerous Matter, poured forth from the Blood, and apt to be too much ſtopped: for both the tubulated Membranes of the Noſe, and the frame or ſubſtance of the Tongue it ſelf, are made of a very rare, and as it were ſpongy Texture: wherefore, the Pores and Paſſages of either Organ, are wont to be overflown by the ſerous flood, and the ſenſible Fibres in both, in like manner to be obſtructed, which happens, becauſe when as the Noſtrils and Tongue ought to be moiſtned, with a continual Humor, either of them are puniſhed more grievouſly than other Parts, by the ſhower of the Serum iſſuing forth, ſo both on every light Cauſe, become obnoxious to the ſame Evil.

Why one being wanting, the other for the moſt part is Defective.

CHAP. XIV.

Of the Senſe of Hearing.

The Excellency of Hearing, as to Uſe and Activity.

AFter the Smell and Taſte, of which we have already treated, we ſhall next ſpeak of Hearing; which as to the uſe, is far more Excellent than the other Senſes; for as much as by its help chiefly, Sciences and Learning are acquired, alſo by whoſe inſtinct, the Paſſions are excited; yea, and are wont to be governed and allayed; further as to Activity, this Senſe is much more Efficacious, becauſe having got a larger Sphear, perceives its Objects at a great diſtance, and admits not the ſenſible Species, unleſs brought in a more thin conſiſtency: For that it is the Intereſt of living Creatures, to know ſome remote things by Contact, and often placed out of Sight, becauſe they may be timely prevented, if they ſhould be inimical and diſagreeable, but if thought amicable, that they may be come to, and apprehended; the Hearing ſerves for either Intention, and by its ſign, the Marks and Symbols of approaching Bodies are received afar off.

Is performed at a diſtance, by reaſon of the Activity of the Medium.

Becauſe the Hearing is always performed at a diſtance, and a ſound comes often farther than the Effluvia's of a ſounding Body, can be admitted; therefore, this Senſe is ſuppoſed to be made even as Sight, by reaſon of a certain activity of the Medium it ſelf, or by a Motion, and as it were a certain waving of little Bodies, which flow in it; ſo as the ſounding Body, moves by its Vibration or ſhaking the Particles diffuſed in the intermediate ſpace, and they being moved, at length affect the Senſory; but they conceive a certain Figure of their carrying forth, according to the Particles firſt agitated, and they propagate the ſame in others, and then in others, or move forward, as it were by undulation, and ſo the ſound, ſtill retaining the Character or Type of the firſt Impreſſion, is continued even to the Ear.

The Medium carrying ſounds is the Air, but not the whole frame of it.

Altho by the conſent of all, the Air is ſaid to be the Medium, that carries the ſounds, yet this ought not to be underſtood of the whole Atmoſphear of the Air, and Breaths; for neither is the audible Species poured forth, by the Motion of this moſt fluid Body, as it were by a waving of Waters; becauſe this much ſooner runs thorow, than the Body or Conſiſtency of the whole Air is wont to be moved, and propagate its Fluctuation,

as

as may be diſcerned plainly by the ſucceſſive blowing of the Winds, and bending of Trees, and the tops of Corn, which happens, becauſe any ſound, whether great or ſmall, whether it comes with or againſt the wind, is carried to a certain place, always with an equal time; which would be otherwiſe if it obey'd the waving of the whole Air, or ſhould depend upon that: Further, That the whole frame of the Air doth not wave, by reaſon of the tranſmiſſion of the ſound, appears by this; becauſe, if a Lamp be held in a little Bell, whil'ſt many other Bells being ſtruck together, yield a mighty ſound, its flame will hardly ſhake, much leſs will it be moved up and down hither and thither, by the moved Air.

The Sonorifick Particles ſeem to be Saline little Bodies, interwoven with the Air.

Hence it follows, that ſome Sonorifick Particles, or Cauſing ſounds, are diffuſed thorow the Air, and as they are more ſubtil than the little Bodies of the Air, and are indued with a more rapid Motion, the Tranſmiſſion or Propagation of the ſound, depends upon the peculiar motion and waving of theſe, made apart from the inclination of the whole Air. We have elſewhere ſhewn, in the texture of the Atoms of the Air, that there are contained Luminous or Nitrous Particles, by the inkindling, and by the moſt ſwift trajection, and reflection of theſe, Light, the appearances of Colours, and the Images of all things are produced. And beſides theſe moſt thin and moveable Bodies, which ſeem to be of a certain fiery Nature, and interwoven with the Air, and by the private waving of which, the viſible Objects are carried to the Organ, it is likely, that certain other Particles of another Kind, and thoſe perhaps Saline, are diffuſed thorow the rare and moſt fluid Conſtitution of the Air, by which, whil'ſt they are ſtrucken and ſwiftly moved, and apt to be figured, according to the Idea's of Sounds, the Organ of the Hearing is alſo affected, and by this means receives the Impreſſions of ſenſible things. For it ſeems, that the Sound-cauſing little Bodies ſwimming in the Air, and interwoven with a certain Continuity in its Pores, and thickly ſet in its paſſages, are placed after that manner, that when a Motion is impreſſed, in any Portion of them, by the ſtriking againſt a ſolid Body, they being agitated according to the Character of the Impreſſed Motion, move or ſhake others planted round about, and they again others, which are next to them, and ſo, when the ſame Motion is propagated round on every ſide, by a ſucceſſive affection of the ſame Particles, (as when a Stone being caſt into a ſmooth water, many little Circles beginning after one another, and unfolding themſelves, create an Impreſſion of the firſt ſtroke in every part) leſſer types of the ſound, and almoſt innumerable, take the place one of another, or fill up the room of the firſt Prototype ſound, excited according to the ſolid Body, and from thence on every ſide waved, according to the Symbolical Particles ſucceſſively moved; even after the ſame manner, as when the rayes of Light are reflected from an Opacous or ſhaddowy Body; for as much as they being ſent at hand from every part of the Object, do meet together in a moſt thick Series of Cones, in every place, and ſo create infinite Images of the ſame thing, viſible in all places: In like manner alſo, whil'ſt the Sonorific Particles leap back from a ſolid Body, they cauſe the audible Species to be every where repreſented, according to the ſtroke there made upon them, in the whole Sphear of Vibration, whether by a like Contortion, or Gyration, or any other ways of Conformation in Motion, of the ſymbolar Particles.

The Prototype of a ſound, by and by ſtirs up innumerable Ectypes.

How the Sonorifick Particles, differ from the luminous.

But altho there are found Sonorific little Bodies ſomething like the luminous, they are differenced notwithſtanding in many things; for firſt of all, their Motion is much more ſlow than the luminous, which clearly appears from a Gun being diſcharged at a diſtance, for it is ſometime after the flaſh reaches the Sight, that the report comes to the Ears. But the luminous Particles, tho they eaſily paſs thorow the more ſolid Diaphanous Bodies, yet not thorow thick ſhaddowy or Opacous Bodies, tho they are made of a more thin or rare texture; or ſtick in the chinks: On the contrary the waving of a ſound, does not ſo eaſily paſs thorow Glaſs, but the ſame is often heard within a Chamber, that is impervious of Light, or where Light cannot enter. Hence it may be conjectur'd, that the rayes or beams of Light, how ſubtil and thin ſoever they be, are carried only in ſtrait Lines; for whether they at firſt ſtream forth, or are broken in the altered Medium, or are reflected from an objected Body, they every where paſs forward, and obſerve the Line of direction, and paſs thorow the oblique and winding paſſages, not with a turning paſſage or going thorow; but the ſounding Particles, being excited into Motion, inſinuate themſelves within the bending pores and blind holes, like the flowing of Waters; but theſe Kind of little Bodies, which are the Vehicles of ſounds, I ſuſpect to be of a Saline Nature, for this reaſon; becauſe the Particles of this Element, are moſt of all Moveable and Active, next to the fiery and Nitrous Sulphureous; for it is ſeen, that Glaſs, and Metallick Bodies, which abound with very much Salt, being ſtruck, yield a ſound excelling all others: Alſo it makes for it, for as much as in a great Winter Froſt, when the Atmoſphear of the Air abounds with Saline Particles, a ſound becomes more clear, and is carried farther.

Theſe are carried only in ſtrait-lines, thoſe in all.

Why they ſeem to be Saline.

So

So much concerning the Sonorifick Particles, as much as we are able to get by Conjecture; concerning their Nature, Subſiſtence, and wayes of carrying forth, or of waving. As to theſe, what at firſt was propounded, concerning the Senſe of Hearing it ſelf, there remains yet to be unfolded, by what means, and for what occaſions, theſe Particles interwoven with the aerial Body, are ſtirred up by a ſounding Body into Act; then how the ſame being moved affect the Senſory.

By what means Sonorifick Particles are ſtirred up into Act.

As to the former, there are infinite ways, whereby the aforeſaid Particles are ſtirred up into Act, or by which ſounds are wont to be produced; whatſoever percuſſion of a ſolid Body, yea and almoſt every vehement Compulſion of the Air, when reſiſted, yields a ſound. There are very many Varieties of theſe, but the Univerſal, or at leaſt the chief Cauſes of ſounds, may be not improperly reduced to two ways of being made; to wit, either that a ſolid Body being ſtruck, and ſo affected with a Vibration or ſhaking, drives together the Air, and with it the Sonorific Particles, and the ſtroke being moſt ſwiftly repeated, cauſes them to ſhake or to wave; Or ſecondly, the Air, and with it the Sonorific Particles, being driven into a more narrow ſpace, whil'ſt they go forth by Compreſſion, are ſtruck againſt the ſolid Body, and are driven by it into a vibration or ſhaking. By reaſon of the former way, all ſolid Bodies, ſtruck by ſolids, yea and hollow Metallick Bodies, a Drum, the ſtrings of an Harp, and other Muſical Inſtruments, furniſhed with ſtrings, when they are ſtroke, yield a ſound; in all which, a vibration being excited from the ſtroke and ſhaking Body, and impreſſed on the Sonorific Particles, is the whole Cauſe of every produced ſound, or of long Continuance, and alſo tho but of a minutes durance or ſounding. For both Metals, alſo Stones, and Wood, and other ſolids, being ſtruck, make the Air to tremble and yield vibrations or ſhakings, in ſome meaſure like Bells, and the ſtrings of an Harp: Wherefore, when by the Finger or any ſoft Body being lay'd upon them, that ſhaking is ſtopt, preſently the ſound is intercepted. In the latter Rank, to wit, where the Air is compelled or ſtraitned, whil'ſt it ſtrives for liberty, ſtriking againſt the ſolid Body, produces a ſound, ought to be placed ſounds, which are excited by ſpeaking, wind Inſtruments, letting off of Guns, and the paſſage of winds thorow ſtrait places.

Or how ſound is cauſed, and ſtop'd.

As it thus appears, by what means the Sonorific Particles are ſtirred up into act, there remains a no leſs difficulty, concerning the way, whereby they affect the Organ of Hearing, that by it a Feeling or Senſion is produced. We ſhewed before, that by reaſon of the aforeſaid Particles being interwoven with the Air, and ſucceſſively moved with a continued Series, the Impreſſion of a ſound is diffuſed every where, into a Round or Orb; Further, we Note, that if their waving promotion meet with any ſtop, the ſame being thereby reflected, or forced by another thing, it in like manner affects other Particles, wherever met with, and ſo is ſtill broken into more ſounds, which are carried hither and thither into every part; which is the reaſon that ſounds climb over Houſes, being ſent forth at hand, return back, enter into every hole and chink, and eaſily propagate themſelves into ſecret places and receſſes, where light cannot enter; In the mean time, all ſounds, both direct and reflected, and which are diverted aſide, and which become leſs and numerous, from greater refracted and divided ſounds, and variouſly reſult, exactly bear the Character of the Prototype of the ſame ſound: Hence it comes to paſs, that the Hearing being planted in every place, it receives the ſame ſound in ſpecie, and oftentimes articulate.

The Motions, or ſpreadings of an excited ſound.

But as to the ſecond Propoſition, for the manner of doing, whereby by the Senſe of Hearing is performed, we think that firſt of all, the Structure of the Organ it ſelf ought to be conſidered; in which, that which being utmoſt receives the firſt ſtrokes of the ſound is the Ear: This part being largely ſpread, by degrees grows narrow, till the hole made more narrow, leads inward to the den of the Ear. The uſe of the Ear is to gather together the Sonorific Particles, coming to it ſpread abroad and diſperſed, and ſo many; that the Impreſſion may be made more ſenſible, to direct it inwards towards the Senſory. In imitation of this natural Inſtrument, are wont to be made the Artificial whiſpering Inſtruments, which like a Pipe or Trumpet, by introducing many Sonorifick Particles, ſupplies the defect of Hearing. The Ears in moſt Beaſts are moveable, that they might be turned every way, to any noiſe, and might receive a more certain notice of the ſound, otherways uncertain; yea, it is probable, that mens Ears are moveable by Nature becauſe they have hanging Muſcles, but that by the continual uſe of the Head-bands, which they make uſe of in Infants, this faculty is taken from them.

The Organ of the Hearing deſcribed.

The Ear and its uſes.

After the Ears, follows the Cave or Den of the Ear, leading obliquely towards the inward Parts. Whil'ſt the Sonorifick Particles paſs thorow the turning and winding paſſages of this, the ſame, by reaſon of the frequent ſtrikings and refractions againſt the ſides, encreaſe the ſenſible Species; after the ſame manner, as is ſeen in Cornets, and wreathed Inſtruments, by which the ſound is very much ſtrengthen'd. Alſo this further

The Den of the Ear and its uſes.

further appears, for that the Hollows or Cloyſters in ſome Walls, are wont to be ſo artificially made, that a low Voice whiſper'd, being tranſmitted by the ſame, may be heard at a great diſtance. Moreover, the aforeſaid Den of the Ear ought to be oblique and turning, that its more inward parts mought be defended from the eaſie meeting with of Injuries; and for this reaſon, there is there placed a bitter Wax, ſweat forth from the little Arteries; ſo that if any little living Creatures, ſhould by chance creep into the Ear, they might be there entangled, or at leaſt driven away by the Bitterneſs, as Worms by Gall. This yellow ſtuff without doubt is of the ſame Nature with that which is deſtinated for the Bladder of the Gall.

The Drum. Nigh to the moſt intimate receſs of this Den, a thin Membrane is placed, with a Circular Bone, fitted to the ſame, which wholly ſhuts up the Cavity of the Ear, and diſtinguiſhes the Interior Cloyſter from the Exterior; ſo that the Impulſe of the ſound, ſhaking this Membrane like a Drum, delivers the Impreſſion to the Sonorifick Particles planted beyond, and they being moved, affect the Fibres, with the Auditory or Hearing Nerve.

Three little Bones about the Drum, with the Muſcle and Ligament. About this Membrane, three little Bones, with a Muſcle and Ligament, and ſome other Parts, are placed; from which being thorowly view'd, and truly conſider'd, the Uſe and Offices of the Drum, and its whole Appendix, are clearly learnt. The firſt of theſe is a little ſmooth Bone, lying upon the more inward part of the Drum, and ſticking to it, this is commonly called the Hammer, either from its figure, or rather becauſe it is thought to ſtrike and knock againſt the Drum; when indeed, this Bone affixed to the Boſs or Shield of the Membrane, ſtrikes not againſt it, but bends inward, and draws it with it. Alſo, beſides this little Bone, is united with many other little Bodies, for the Tendon of the Muſcle, which lifts it up, and bends it inward, is inſerted into its ſharp Proceſs, and the other more blunt extremity of the Hammer, is ingrafted with the Anvil, ſo that the Hammer may be able to move round about upon the Anvil. This

The Hammer.

The Anvil. Anvil is a Bone almoſt round, which leaning into the Cavity, hath two proper Shanks, one whereof being fixed to the Cartilage, is faſtned by the ſame to the ſtony Bone; but the other ſhank of the Anvil is joyned by the Cartilage to a third Bone, called the Stirrop; ſo that the Anvil being joyned by the Cartilage to the Stirrop, is alſo moveable; and the two ſhanks of the Stirrop are affixed to the Ligament, and by it ſtick to the ſtony Bone. As to the Muſcle, which lifts up the Hammer, (althô at firſt ſight only its Tendon appears) if it be farther ſearched, it is ſeen to be big enough and round, planted in its proper Cavity, the Tendon of which is inſerted into the ſharp proceſs of the Hammer, and lifting it up, and drawing it inwards, bends and diſtends the Drum within; notwithſtanding, leſt this Muſcle (if it ſhould happen to be pulled) ſhould be brought too near to the Drum, a ſmooth a tranſverſe Ligament, is placed before the acute proceſs of the Hammer, which ſtrictly leans on the Hammer, and binds it; and leſt it ſhould be drawn beyond meaſure, by the Muſcle, contains it in its due ſite.

The Stirrop.

The Muſcle.

The Ligament.

The uſe of the Drum. From theſe it is eaſily to be underſtood, what uſe theſe Parts are for, which we deſcribed: For it is ſeen, that the Drum is the Preliminary, and as it were Preparatory Inſtrument of Hearing, which receiving the firſt Impreſſion of the ſound, or ſenſible Species, directs them in due proportion, and apt conformity towards the Senſory, which is placed more inward: It performs the like office in reſpect of the Hearing, as the Coats of the Eye, conſtituting the Pupel or Apple, in reſpect of the Sight; either Membrane break and as it were ſoften the ſenſible Species, and deliver them to the Senſory in proportion, to which if they ſhould come naked, they might hurt or deſtroy eaſily its more thin Conſtitution. Indeed the Drum does not hear, but contributes to the better and ſafer hearing. If this Part ſhould be deſtroyed, the Senſe may be ſtill continued for a while, thô after a rude manner: becauſe it appeared by an Experiment made in a Dog, that having boared both the Drums of his Ears, Hearing remained ſtill for a time, which after three Months wholly ceaſed, to wit, after the Conſtitution or Craſis of the Senſory, ſuffering by outward Injuries, was overturned.

The Drum hears not.

The uſe of the little Bones, as alſo of the Muſcle, and Ligament. But that the Drum might truly perform this ſort of office of a Porter about the Hearing, its ſtretching forth ought to be bound or looſned, as occaſion ſerves, to wit, as the Pupil of the Eye is wont, as the matter requires, to be either contracted or dilated. Wherefore, certain Machines or Braces, like to a Drum of War, are appointed for the Drum of the Ear, which render its Superficies ſometimes more ſtiff, and ſometimes more looſe: For this, the three aforeſaid little Bones, with the Muſcle and Ligament, effect. The Muſcle lifting up the Hammer, whil'ſt it Contracts it ſelf, the Drum is diſtended, when it remits its endeavour, that is ſuffer'd to be looſned; but the Ligament moderates the action of the Muſcle, and hinders, leſt the Hammer being too much drawn up, ſhould diſtend the Drum till it break: But that the Rod or Beam (which is a part of the hammer) affixed to the Membrane, and drawing it to the Motion of the Muſcle, is not

one

one Bone, but three little Bones joynted in one another; the reaſon is, both that the drawing of the Membrane be not too hard and ſtiff, but with a certain ceaſing and flexibility of the Beam, without which the Drum, for that it is a moſt thin little skin, would be in danger to be broken; alſo, that by ſo many joyntings of the Beam, the motion of drawing might be determined, as occaſion ſerves, into various parts, hither and thither: This part hath almoſt the ſame uſe as the *Hyodes* Bone, which is made of many little Bones joynted together.

The involuntary Action of this Muſcle.

As to the Action of the Muſcle lifting up the Hammer, it ſeems that it is chiefly involuntary, and that 'tis acted by the inſtinct of Nature, according to the indigencies of the Bone; for when a ſound too vehement ſtrikes the Ears, this Muſcle remits its indeavour, that the ſenſible thing might ſtrike more ſtrongly the ſooſned Drum; but if a ſmaller or duller ſound enters, the Muſcle being contracted, diſtends the Drum, that the Impreſſion otherwayes obſcure may become more ſenſible: If that many voices and confuſed ſounds approach the Ears, it is probable, that the Drum diſpoſes the Species brought to it, after a diverſe manner of Action, and as it were admits them in, with a certain Choice.

Deafneſs ſometimes proceeds from the looſneſs of the Drum.

Althô Hearing is not made by the Drum, as the proper Organ of Senſe, yet this ſo much depends upon that, that oftentimes the Action of the Drum being hurt or hinder'd, a privation or a diminution of that Senſe follows. For we meet with a certain kind of Deafneſs, in which thoſe affected, ſeem wholly to want the Senſe of Hearing, yet as ſoon as a great noiſe, as of great Guns, Bells, or Drums, is made near to the Ears, they diſtinctly underſtand the ſpeeches of the by-ſtanders, but this great noiſe ceaſing, they preſently grow deaf again. I heard from a Credible Perſon, that he once knew a Woman, thô ſhe were Deaf, yet ſo long as a Drum was beaten within her Chamber, ſhe heard every word perfectly; wherefore her Husband kept a Drummer on purpoſe for his Servant, that by that means he might have ſome converſe with his Wife. Alſo I was told of another Deaf Perſon, who living near a Ring of Bells, as often as they all rung out, he could eaſily hear any word, and not elſe. Without doubt the reaſon of theſe is, that the Drum of it ſelf being continually looſe, by the impulſe of a more vehement ſound, is compelled to its due tenſity or ſtretching forth, by which it might in ſome meaſure be able to perform its office. But we will proceed in Order, to the other Parts of the auditory Organ.

The Cavern containing the Air, placed behind the Drum.

Behind the Drum, the Den or Cavity ſubſiſts, in which the Ancients placed the inplanted Air, which received the impreſſed ſound from the Drum: which thing indeed is not unlikely; for, becauſe the waving of the ſound ought to be conveyed ſtill further towards the Senſory, it ſeems that the Sonorifick Particles, which are their Vehicle, are contained within this Den; and becauſe it is needful, that the Sonorific Particles, included in this Den, ſhould be in ſome meaſure conſumed; therefore from this hidden place, there lyes an open paſſage into the Palate; but yet after that manner, that little doors being placed in its upper part, it admits the Air fetch'd from the Palate, as often as there is need; but the ſame being admitted into the Den of the Ear, its paſſage out by the ſame way is hindred. By reaſon of this Channel, it is, that the ſound becomes rather ſenſible to the Palate of ſome deaf People, than to their Ears; to wit, when the office of the Drum is ſpoiled, the ſenſible Impreſſion is carried, in ſome meaſure, to the Senſory, by this other way.

From this Den a Paſſage into the Palate.

Another Paſſage from this Den (called the Navel hole, or the Window) leading into the Shell.

But from the aforeſaid Den, placed behind the Drum, another paſſage leads towards that part, which is properly the Organ of Hearing; to wit, in the extream ſide of that Cavern, before-mentioned, there is a door, or certain round hole, covered with a thin Membrane, commonly called the Window, and beyond that hole, to wit, in the end or ſharp proceſs of the ſtony Bone, is the Shell contained: from whence we may think very well, that the impreſſion of the ſound brought through its next Chamber from the Drum, is from thence propagated, by an impulſe made above the Window, into the Shell.

The Deſcription of the Shell.

But the Body of the Shell is an admirable Structure, which being framed in a peculiar receſs of the ſtony Bone, is called by ſome the Labyrinth, by others the Shell; becauſe its paſſage or hollowneſs, after the manner of a Snails ſhell, is carried about with a turning or ſpiral Convolution. There are two parts of this, or rather there are two Shells, the former being nigh the chief Oval hole, is leſs'ned by degrees, from the Spire or more broad Capacity, and ends in a very little one, then from the end of this, another Shell, beginning with a very ſmall ſpire, is inlarged by degrees, in its progreſs, and its extremity opens with a greater aperture, into another Den or Chamber, placed beyond, with an open mouth; this is without any Membrane covering it.

The Uſe of it.

As to the Shell, the uſe of it ſeems to be, that the audible Species being brought thorow ſuch turning and winding Labyrinths, and ſo receiving an augmentation by reflection, and manifold refraction, it may become more clear and ſenſible; then further, that every

Impreſſion, carried about by this winding and very narrow way, may come more diſtinct to the Senſory: becauſe by this means, care is taken, that many confuſed Species together, may not be brought in. After the example and ſimilitude of this Shell, artificial Caverns, and arch'd Meanders, are wont to be framed by Architects, for the increaſing of ſounds, and for the diſtinct propagating of them to a wonderful diſtance. Further, there is another uſe of the Shell, no leſs noted, to wit, that the audible Species may be impreſſed on the Fibres and the ends of the ſenſible Nerves, inſerted in this place, not at once or at large, but by little and little, and as it were in a juſt proportion and dimenſion.

The auditory Nerves.

We have elſewhere diſcourſed concerning the Hearing Nerves, which receive the ſenſible Species, and carry it towards the Common Senſory, and we ſhewed, that the ſofter proceſs of either of the ſeventh pair, is deſtinated to this office; wherefore the end of this Nerve is terminated in the neareſt Chamber of the Shell, whence it is manifeſt, that the ſenſible Impreſſion, being diſpoſed from the Shell into this Chamber, is conveyed thence towards the Head, by the paſſage of this Nerve. But moreover (which we took not notice of before) it is obſerv'd, that this ſofter auditory proceſs, is cleft into two branches: one whereof is inſerted after the manner we have here deſcribed, into the aforeſaid Chamber; but the other, no leſs noted branch, is implanted in the Shell it ſelf, about the mid'ſt of it, or nigh to the meeting of either Labyrinth; ſo that this branch ſeems to receive the Depoſitum of the foremoſt Shell, and the other aforeſaid of the latter Shell.

Two Proceſſes of the ſofter auditory Nerve, one tends into the next Chamber of the Shell.

The other into the Shell it ſelf.

The extremity of either auditory Nerve, which are implanted about the end of either Shell, ending in ſlender thrids, ſeems to cover over the places of Inſertions, every where with Nervous Fibres ſpread abroad, as it were into a certain little Membrane; whence it follows, that towards the end of either ſhell, the proper Senſory of Hearing ought to be placed; for there is the Senſe, where the Nerve receiving the Idea of Senſion, is implanted; but as the Shell is twofold, and that in like manner there is a double inſertion of the forked auditory Nerve, it follows, that in either Ear, there is a twofold Organ of Hearing: but for what uſe this is ſo made, does not plainly appear.

For what Uſes it is ſo made.

That we may give our Conjecture concerning theſe, perhaps there is need for the audible Species, to be carried toward the common Senſory, that its paſſage may be the more certain, and that the perception of the ſenſible thing, may be put out of doubt; but we rather think, that this Senſory is made double, that when oftentimes the Idea's of ſounds ought to be heard and perceived together, ſome might paſs this way, and others that way, without Confuſion. For it is obſerv'd, that the Hearing, not only as the other Senſes, receives many objects together; and by and by whether united or confuſed, comprehends them, by the ſame act of the Senſe; but moreover, this faculty in the time of Hearing, ſo diſtinguiſhes things, often divers, admitted together at the Ears, that it ſeems to hear one after another: It ordinarily happen'd, that in a confuſed multitude of voices and ſounds, that I have my ſelf taken notice to have heard the peculiar voice of a certain Man, and then a little after, I have known that I have heard, at the ſame time, ſome other words of another Man, that I did not perceive before; the reaſon of which is, that this ſound, being received together with that, reached not at the ſame inſtant to the Common Senſory: wherefore, we may believe, that the ſenſible Species of the former ſound, paſſing thorow only one Shell, is by and by conveyed, by the firſt branch of the auditory Nerve, ſooner to the Senſory, but the other ſenſible Species, becauſe it could not be carried with it together by the ſame Nerve; therefore it is carried by a winding about thorow the ſecond Shell, and at length to the ſecond branch of the auditory Nerve, and ſo coming later to the Common Senſory, is afterwards perceived.

A rehearſal of the Parts, which ſerve for Hearing.

Thus much concerning the Inſtrument of Hearing, and its parts, both Preparitory, and chiefly Organical; of the firſt ſort are the Ear, the outward Den, the Drum, and what belongs to it, the interior Den, and its two doors; to wit, one admitting inward thorow the door from the palate, the other emitting thorow the oval hole: Of the latter ſort are, The twofold Shell, with both the Branches of the auditory or hearing Nerves. Both the Parts, for the moſt part, are of like make in all Animals; the greateſt mark of difference is, as to their Ears, which are variouſly figured, partly for ornament ſake, and partly for a diverſe uſe in reſpect of the inward Den, placed behind the Drum: for this is framed in a Calf, Sheep, and perhaps ſome other Animals, of ſpongy Bones, and long Caverns, having receſſes in themſelves; In Man, and in Doggs, and perhaps in many others, who are indued with a more acute Hearing, this Cavity is ſhut up with a round Bone, having a plain Superficies within, whence the ſound is reflected more ſtrongly into the Shell; but in a Calf, and Sheep, the ſound ſeems to be much broken and debilitated, in theſe bony Caverns; wherefore, theſe Animals are ſaid to have ſlow Ears; for it is not expedient, for ſuch deſtinated for to be fatted for Food, to hear acutely, that they might be affrighted and provoked by every Noiſe.

How they differ in Man, and in ſome four-footed Beaſts.

CHAP.

CHAP. XV.

Of the Sight.

IF there be any ſtrife for Dignity among the Senſes, the Palm is given, almoſt by the conſent of all, to Seeing, as the moſt noble Power; becauſe this faculty apprehends things at a great diſtance, under a moſt ſubtil Figure, by a moſt clear perception, and with great delight; ſo this Senſe acts, that is next in virtue to the Eternal and Immaterial Soul: To wit, it views and meaſures both Heaven and Earth in a Moment, and brings within its embraces whatever Bodies are ſituated in either, and that are far remote from our touch. *The Sight is the moſt noble Senſe.*

'Tis needful that Seeing ſhould be ſo performed at a diſtance, that viſible things might diffuſe, and every where propagate themſelves by their Images far and wide; ſo that where-ever the Eye is ſtop'd, the Images of ſome Bodies objected are met with. But after what manner this is done, and by what means the ſenſible Species is received by the Organ, ought a little more deeply to be inquired into. *It acts at a diſtance by reaſon of the Species of viſible things diffuſed afar off.*

As to the firſt, althô Light, Colours, and Images, are wont to be moved from place to place, and by the help of Glaſſes to be transferred hither and thither, and indeed affect the Eye with their Motion, yet it is manifeſt, that they are not meer Qualities, but certain Bodies, or conſiſt of moſt thin little Bodies. Theſe three are very much of Kin among themſelves, and differ little or nothing one from another, as to their Eſſence; for indeed, the ſame Effluvia's or little Bodies, for as much as they proceed from a lucid Body, are called Light, for that they are reflected from an opacous or ſhaddowy Body, under a certain placing and meeting together, cauſe the Image of the Object; and for as much as it happens, the ſame rays of Light, in their reflection, are broken or turned in, from a dark or opacous Body, after this or that manner, they cauſe the Appearance of this or that Colour to be repreſented. *Light, Colours, and Images, are the ſame ſubſtance.*

As to the Rays themſelves, or the paſſing thorow of little Bodies, the irradiation or beaming forth of which, ſhews the Repreſentations either of Light, Colour, or Images, it is much diſputed; whether they are only Effluvia's, darted from a lucid Body, and repercuſſed in their going forth, and reflected variouſly here and there, as is aſſerted by *Gaſſendus*, and ſome others; or whether Particles being ſent forth from a lucid Body, move other the like Particles, implanted in the Air, and as it were by inkindling them render them luminous, and theſe at length others, and ſo a diffuſion on every ſide of Light, or Images, is propagated as it were by a certain waving. *What the Rays are, which cauſe the viſible Species.* *Whether they are Particles, ſtreaming from a lucid Body;*

Againſt the former Opinion 'tis objected, that it ſeems impoſſible, that the Effluvia's of flame or fire, ſhould be able to be unfolded ſo ſuddenly, and dilated or ſpread abroad to an immenſity: for when a Candle being lighted, immediately the whole Chamber is illuminated, it can ſcarce be conceived, that the fiery little Bodies of that flame, ſhould break forth ſo ſuddenly and ſo thick, that they ſhould fill, in the twink of an Eye, ſo vaſt a ſpace. For indeed, the new Motions and Increaſe of an inkindled flame, are more ſlow and perceivable to the Sight it ſelf; how therefore can we imagine, the motion or dilatation of Light, for that this is but only a thinner flame, to be ſo incredibly ſwift? Beſides, when in the ſame inſtant, in which a Light placed in an eminent place is inkindled, it is beheld at many Miles diſtance, none can think, that theſe Particles ſent forth from it, can be able to be carried ſo long a ſpace, at leaſt in ſo ſhort a time; but truly, how ſhould it be ſuppoſed, that theſe Effluvia's ſtreaming from a ſmall Light, ſhould preſently poſſeſs the whole Hemiſphear? Becauſe the light enkindled in the whole Region round about, meets with the Eye where-ever placed. Beſides, when from a Glow-worm, a certain kind of Light or fire ſhines in the dark, and is perceived at a diſtance, if this apparition ſhould be made by reaſon of the fiery little Bodies ſtreaming from this little Creature, whence I pray is ſo much fiery Tinder ſupplied? From theſe and ſome other Reaſons, we are led to believe, that when the Medium is ſo ſoon inlightned, beſides the Effluvia darted from the lucid Body, others alſo interwoven with, and implanted in the Air, being moved by thoſe Effluvia's, and as it were inkindled, contribute to illumination. *Or rather, whether inkindled Particles of Nitro-ſulphureous Air.*

For the Explanation of this, hither ought to be referred what hath formerly been ſaid concerning the Nature of fire and flame; to wit, we have ſhewed, that with the Sulphureous Particles, breaking forth from an inflameable Body, others Nitrous do come from the Air, and are inkindled with them, and ſo do not conſtitute fire or flame, unleſs both *Which Opinion ſeems moſt likely.*

The differences of flame, and light.

are joyntly inkindled. The like reaſon may be given of Light, and conſequently of Images, and Colours, moſt ſwiftly produced from Flame and Light: to wit, ſome Sulphureous Particles being carried beyond the compaſs of the Flame, joyn together with others Nitrous, and eaſily inkindled, and ſo produce a moſt thin Flame, *viz.* Light. For indeed, from an inkindled fire, many ſulphureous Particles preſently ſtreaming forth thickly, lay hold on more, or at leaſt the like Nitrous, and ſo conſtitute a more thick and almoſt dark Flame; this, for that it is fat and thick, paſſes not thorow the Pores of Glaſs, and thô it is apt of its own Nature, to be carried in direct lines, yet it is wont to be bent hither and thither, and to be made crooked by the blaſts of Wind, yea to be carried within Tubes or hollow Pipes very crooked. But Light is made of fewer and more ſubtil ſulphureous Particles, which paſſing beyond the firſt inkindling, fly away round about far and wide, and ſo meeting every where with many Nitrous, conſtitute a moſt thin white Flame, and without heat; this eaſily paſſes thorow Glaſs, and all clear Bodies: Its beams, for as much as they conſiſt of more Nitrous than Sulphureous little Bodies, are carried only in ſtrait lines, ſo that thô they are wont ordinarily to be broken or reflected, yet they cannot be made crooked.

Lucid Bodies, are either Cœleſtial,

Or Sublunary; in the light of which, we obſerve three meaſures.

Subjects emitting fiery and luciferous Particles, among the Cœleſtials are the Sun, and Stars; but among the Sublunaries, whatſoever are filled with Sulphur, are apt to flame forth. Concerning the Sun we note, that wherever it may be ſeen in the Earth, it diffuſes a clear Light, ſo do not the fixed Stars, becauſe they are at too great a diſtance from the Globe of the Earth. As to the Subluminary Lights, we ſhall obſerve, as it were three Stadia or meaſures, in which they have their Beams after a diverſe way; to wit, in the firſt place, the Flame conſiſts within the compaſs of a lucid Body, which is both hot, and diſperſes heat every where round about, to what is near, not only by the open Air, but alſo by all Bodies, to wit, both diaphanous and dark, ſolid or rare. Secondly, In the extream Border of the Flame ſucceeds the Sphear of Light, which being more illuſtrious near the Flame, is by degrees attenuated, till it ends in plain darkneſs. Beyond the bound of the Light, the lucid Body propagates its Image or likeneſs a great way; for a Candle being inkindled, is beheld for many Miles in the dark: The trajection of which ſeems to be made, by reaſon of the Impreſſion made on the Nitrous Particles, diffuſed thorow the Air; wherefore when the accenſion ends, about the border of Light, yet from thence it at a long diſtance tranſmits every way an Idea of the Flame or Light, by a moſt ſwift undulation or waving of them being moved.

Wherefore light, either reflected, or refracted, goes forward only in ſtrait lines.

The trajection or the paſſing thorow of the Rays of Light, whether the ſame be direct, or reflected, or broken, goes forward (as we hinted but now) only in ſtrait lines, and not in oblique, or turning about: the reaſon of which is, becauſe the fiery or light-carrying Particles, how ſubtil or active ſoever they be, moſt eaſily paſs thorow, and without any impediment, the Pores and Paſſages of the Air, and follow not its Courſe or Torrent. Further, as the fiery Particles (as it ſeems) are only of a Spherical Figure, and of a very ſmall bulk, their irradiation or beaming forth, is made only in direct or ſtrait lines: to wit, becauſe, when the little Globes breaking forth from any fire, ſtream thickly forth on every ſide, and that the former are joyned to the latter, it is neceſſary, that they ſhould be driven forward to the ſide, ſtill without any declination: for as much as if Pricks be driven one from another, their progreſs create a ſtrait line.

Light can paſs thorow a Chamber in the mean time, not to be perceived.

But hence it happens, that Light does not as a Sound or Odors, paſs thorow winding chinks, or paſſages of holes; yea, neither do we perceive the Sun or Stars, nor the Beams of a Sublunary Light, unleſs the ſame meet the Eye direct, or reflected, or refracted; for it may be made, that an handful of the Beams of Light, may paſs thorow a Chamber whole, that in the mean time the Eye, placed in it, may perceive nothing of brightneſs. For Example, Let there be bored in one end of the Chamber a ſmall hole, and in the other oppoſite a greater, in the ſpace then without the leſs hole; if a Light or Lamp be placed, it ſhall illuminate that ſpace placed without the greater hole, in the mean time, the Chamber between which the Beams of the ſame Light paſſes thorow, ſhall be ſeen dark: The reaſon of which is, becauſe the Beams, paſſing thorow, for that they neither unfold themſelves abroad, nor are reflected, meet not the Eye placed without the line, and therefore create no appearance of Light: alſo, for that reaſon it is, that when we look up from the bottom of a Pit, at Noon day, it is as if it were quite night, and we behold clearly the Stars themſelves, without any appearance of Light.

Light Primary, or Secondary.

But althô Light is devolved into every Part round about, not by a waving fluctuation, but proceeds with only ſtrait rays or ſtrokes, yet theſe rays ſtream forth ſo thickly, and being reflected from Bodies after a manifold way, meet one another, mutually joyn, and are ſent together, with ſo thick a Series, that not rarely almoſt the whole Pores or Paſſages of the Air, are poſſeſſed by them, either direct, or refracted, or reflected. Wherefore

fore Light is wont to be diſtinguiſhed, either that which is Primary, which proceeds immediately from Light; Or Secondary, which is reflected from Objects, which ſort of reflection of it, is wont to be many time reiterated.

Concerning the Primary Light we obſerve, that its Beams, from whatever Light they proceed, either Cœleſtial or Sublunary, are almoſt the ſame; hence it is, when many of a diverſe Original are mixed together, they are not eaſily known aſunder, becauſe the leſſer Light is always obſcured by the greater: But the Secondary Light, or Beams reflected from ſolid Bodies, that beſides, by redoubling the illumination, they render the Medium more clear; alſo, according as they are variouſly modified from Objects, in their being reflected, they create the appearances of Images and Colours. *The differences of theſe.*

Concerning the Nature of Colours and Images, as the Philoſophers of every Age, have diſputed it, and that divers Opinions are delivered, by ſeveral Authors, none as I think has diſcours'd more ingeniouſly, or more like to Truth about this, than the famous *Gaſſendus*; wherefore, if it may be lawful to Plow with his Heifer, we will add the whole Matter in a ſhort ſummary. *The reaſons of Colours and Images unfolded.*

Every viſible thing or Body is lucid, or illuſtrated from Light; That, is beheld by its proper Light, and by direct Rays; This by another, and by reflected Beams; but the Medium is not ſeen purely perſpicuous, becauſe it emits not proper Beams, nor reflects others, by reaſon of its thinneſs. Concerning a lucid Body we obſerve, that this ſhining clearly and without any Impediment, appears under a bright form; wherefore Light in a fountain, is of a white ſhining Colour, but that it alters its Colour, it is nothing elſe than the intermixture made in its Beams, of ſhaddows or darkneſſes; but this is made either by reaſon of little Bodies, being between in the Medium, which avert ſome Beams: So the Sun ſeems red in the Horizon, by reaſon of Vapours which intercept many Beams, or the whiteneſs of a lucid Body degenerates, by reaſon of Particles, not lucid, interſperſed within its Body, and with the Beams themſelves; ſo when Soot and Smoke ſtream forth with the inkindled Light, the Light becomes more red or darkiſh. *According to Gaſſendus, Every Body is either lucid, or illuſtrated.* *The Colour of a Light Body is white.* *Which is variouſly altered, by reaſon of interſperſed Clouds.*

As a lucid, ſo alſo an illuſtrated Body, appears not pure, but altered, under the form of whiteneſs; for becauſe the Rays are not all reflected, but by reaſon of the inequallities of the Superficies, ſome are wholly immerged, and others averted, therefore not a pure whiteneſs, but another Colour is ſeen in it. Indeed, as an illuſtrated Body is more ſmooth and polite, that it may reflect many Beams, the more bright and ſhining it appears, as is manifeſt by a Looking-Glaſs; but the more rough and rugged the Superficies is, that it hides many Beams, or averts them, the more the form of whiteneſs degenerates. *An illuſtrated Body, as it is either ſmooth or rough, reflects Beams variouſly, and therefore produces various Colours.*

Concerning the unequal Superficies of illuſtrated Bodies, two as it were extream diſpoſitions are to be obſerved, by which the proper whiteneſs of reflected Light is very much altered; for either the Superficies of a Body is render'd unequal, by many Swellings up, as it were little hills or bubbles thick ſet, by which, thô many Rays are turned aſide, yet by the divers faces of the little hills or riſings, Beams are reflected in a more thick heap, than from a ſmoothed plane, therefore there is made a white Colour, coming near to the whiteneſs it ſelf of Light. Or Secondly, The Superficies of an illuſtrated Body, gapes with very many Ditches or Pits, as it were Dens, in which the Rays entring, are wholly drowned, and are not reflected at all, from whence comes the black Colour, or a privation of white: after this manner, the two extream kinds of Colours, to wit, white and black, ſeem to be produced.

But as to the other intermediate Colours, beſides the Light, being reflected with little ſhaddows, and variouſly intermixt with darkneſs, we ought to ſuppoſe, the divers manner of refraction of its Beams, to be partly alſo the Cauſe; of which there is a certain ſign, for that in a Triangular Glaſs called the *Priſm*, the Beams being refracted diverſly, falling upon this or that Angle, are wont to ſhew Green, or Purple, or Yellow, or a Colour of ſome other Kind: In like manner we may believe, that alſo the Rays of Light being variouſly broken and turned inwards, in their reflection from an illuſtrated Body, and ſo cut and mixt together among themſelves, do produce all manner of differences of Colours. This is not a place here to treat of the particular Splendor of every Colour, and the manner of their Production, but it may ſuffice, that we have mentioned in general the reaſon of their appearances. *The variety of Colours alſo depends, upon the refraction of Beams.*

But theſe things concerning the Nature of a viſible Object, and the manner of its trajection, being thus premiſed, it behoves us next to ſhew, after what way Sight or Seeing is performed, by reaſon of the ſenſible Species being ſo ſent from the Object, and received by the Organ. This commonly, and not improperly, is wont to be declared by the example of a Burning-Glaſs, which like a little Window is fixed before an hole made in the Wall of a ſhut up and dark Chamber; Becauſe, from the Bodies every *A Burning-glaſs placed before a dark Chamber, declares how Sight is made.*

where

where brought before that hole, the Rays of Light being reflected, meet together in the Glass, and in that passage cutting one another, spread themselves at last within the Chamber, and so upon a white Wall within, represent a Landschap of the whole visible Hemisphear. The Conformation of the Eye it self is much after the same manner, for in it may be discovered, both the shut up Chamber, and humors as it were Dioptric Glasses, which gather together the Beams, and break them after a manifold way, all artificially disposed; and lastly, as it were a whited wall, *viz.* the *Retine* Coat, or the Membrane of the Eye, on which the Images of visible things are Impressed.

The Organs of the Sight, are the Eyes, and the Optick Nerves.

Indeed the Eyes, and Optick Nerves belonging to them, perform the whole Act of Seeing; within the Cloysters of these, the Images of all visible things are formally painted, and by the passage of these, to wit, the Nerves, the perception of the Images there drawn is conveyed to the common Sensory: It now remains, that we consider both the Fabrick in either Organ, and the particular uses of the several Parts.

How the frame of the Eye, is fitted for Seeing.

As to the Frame and offices of the Eye, for the performing of which its Fabrick seems to be made, we shall take notice chiefly of three things to be done by it. To wit, In the first place, That the visible Species, or Rays of Light, sent from a lucid or from an illustrated Body, are intromitted by the Pupill, as it were thorow an hole. Secondly, The Rays so admitted being refracted, and artificially collected, through a fit Medium, are disposed according to the best Dioptrick Rules. Thirdly, That the Images of things, resulting from the due refraction and Coalition of the Beams, may be aptly represented, the interior Den of the Eye is formed, like a black Chamber with a white Wall, susceptible of the Images.

The Anatomy of the Eye, necessary for the Explication of Seeing.

If it should be further demanded, what kind of Fabrick it is of the Eye it self, and after what manner its parts are disposed, by which all its offices are performed, it will not be from the Matter, to shew here a perfect description of the Eye and its Appendix, together with the offices and uses of its parts, truly lay'd down. For truly, if any part of the whole Animal Body deserves a peculiar Anatomy, it is chiefly due to the Eye, which thô made of a very small bulk, contains in its Structure many admirable things, and is of most noble use.

But in delivering the Anatomy of this Member, many Authors, both Physicians and Mathematicians have already labour'd so exactly, that hardly any thing can be added in this business: but because, thorough the frequent Observations from others, made of the same thing, and then again from others, an easier apprehension, and more of certainty, yea, and a more accurate Knowledge is wont to be made; therefore it may be lawful for us, to subjoyn here our description of the Eye, not taken from the Writings of others, but by our own ocular Inspection, and observation of the Eye and its parts.

Why the Eyes are two.

We need not here mention that the Eyes are two, that there may be an help provided by one, against the loss of the other; also that the impression of the Object may be made more strong, and the more certain, which notwithstanding does not become double, being prevented by the Coalition of the Optick Nerves, before they are carried to the Common Sensory: nor is it behoveful to play the Rhetorician, by telling that the Eyes are placed like Watchmen, in an high place, and well fortified, from whence they may be able to move themselves hither and thither, with notable volubility, for the receiving from every part the met with Species, and to direct its Sight every where about: But that we may go about to describe the Fabrick of the Eye, without any Circumlocution; The Parts which belong to it are either Exterior, and as an Orchyard, which serve for Ornament, Defence, or Commodity of Action; of which sort, besides the round Bone, are the Eye-lids, with the hairs of the Eye-lids, and the Eye-brows, also the *Glandule* or Kirnels, with the Vessels, and Excretory passages; or its parts are Intrinsick, to wit, constituting the Globe it self of the Eye; which are again disposed, either about its Compass, as are the Muscles, and Vessels, with the fat lying between; or more intimate, which make up its Penetralia or inmost parts, to wit, the Coates, and Humours: In each of these, we shall note what is chiefly worth noting.

The Parts of the Eye are either Exterior.

The Bone, Eye-lids, Hairs of the Eye-lids, Eye-brows, &c.

Or Interior, the Muscles, Vessels, Coates, Humors, &c.

For what use the Eye-lids serve.

Among the outward parts of the Eye, first is mentioned the Eye-lids, which are like a Membranous Vail or Covering, and cover or expose the Eye as there is occasion: as often as any injury is coming, these most swiftly hiding their Tenants, defend them; also when a relaxation is required from work, and that rest indulges the Animal Spirits, presently the Eye-lids shut their Windows, like an officious Servant; but when the Spirits are called back to watching, these Vails being again opened, the Impressions of visible things are admitted.

They are two in Number.

The Eye-lids are two, to wit, the Upper and the Lower; the motion of this is either none, or very obscure; yea, it is as it were fixed to the mound Bone, with which the other Upper Eye-lid meeting, causes the shutting of the Eye to be more firm. The

Upper

Upper Eye-lid, for the double Motion of opening and ſhutting, is furniſhed with two Muſcles, to wit, one ſtrait, which ariſing near the Optick Nerve, with a broad and very thin Tendon, is inſerted into the Margin of the Upper Eye-lid; this Muſcle with its contracted Fibres, lifts up the Eye-lid: The other Muſcle is Circular, which ariſing about the greater corner of the Eye, and from thence encompaſſing the lower Eye-lid, reaches to the Upper Eye-lid, nigh the other corner of the Eye, and coming under it, returns towards its beginning, this Muſcle thus brought about, as it were into an Orb, draws down the Eye-lid, and ſo ſhuts up the Eye. *There are two Muſcles of the Upper.*

As to the Nerves which are inſerted into the Muſcles of the Eye-lids, we have ſhown elſewhere, that they are of a twofold Kind, to wit, ſome ariſing from the fifth Pair, others from the ſeventh; by virtue of theſe it comes to paſs, that the motion of the Eye-lids accords with the Soul, and fitly anſwers to all the Paſſions; and that not only in opening and ſhutting the Eyes, for Sleeping and Waking, but in variouſly turning about, and compoſing the Eye-lids themſelves, as is to be ſeen in Weeping, Anger, Joy, Sadneſs, Shame, and other Perturbations; which Kind of Pathetick motions of the Eye-lids, are for the moſt part involuntary, or are perform'd at leaſt unthought of. *With what Nerves they are furniſhed.*

By reaſon of the Nerves of the ſeventh Pair inſerted alſo into the Eye-lids, it may be known, wherefore we ſuddenly ſhut, or open, or any other way role about our Eye-lids, at any unaccuſtomed Sound, coming ſuddenly to the Ears. It is ſhewed elſewhere, why the Eye-lids being affected at the approach of Sleep, with a kind of heavineſs or weight, deſire to be cloſed whether we will or no, or thô we ſtrive againſt it; where we treat particularly of Sleeping and Waking.

There is nothing to be obſerved but what is Common, concerning the Hairs of the Eye-lids, and Eye-brows; to wit, theſe hairy Walls or Mounds, like Ramparts, are conſtituted with a double Series or row of noted Pallizadoes, for the defence of the Eyes, by which care is taken before-hand, leſt any troubleſom things ſhould unawares fall into the Eyes, or leſt that any thing ſhould ſlide into them from the Head. *The hairs of the Eye-lids and the Eye-brows.*

We will paſs from the Eye-lids to the *Glandula's* or Kirnels of the Eye, which indeed ſtick to their Back, and put forth the Humour belonging to the Eye, thorow proper Paſſages, which lye open within the interior Superficies of the Eye-lids; if that a ſuper-abounding ſerous Humor is poured forth, more than it ought into the Eye, that falling down into a Cavity like a Baſon, nigh the greater corner, enters there two little holes, from which going out into a ſingular paſſage, is carried even to the end of the Noſe, where it is ſent forth of Doors at an open paſſage; beſides, the ſerous Humour in a Man, being plentifully heaped up, nigh to the *Opthalmick* Kirnels, drops forth in Tears. *The Kirnels are two.*

Indeed, the Eye leans on theſe two Kirnels, as it were ſoft ſtays laid under its round Cuſhion; one of theſe ſited nigh the greater corner of the Eye, is wont to be called commonly the *Lachrymal* Kirnel, thô the other better deſerves the Name; To this belong Arteries, Veins, and Nerves, alſo excretory Veſſels, which are of two ſorts, to wit, out of this Kirnel, open two or three water-carriers; into the inward Superficies of the Eye-lid; out of which the watry Humor drops forth upon the Ball of the Eye; beſides, two paſſages alſo open into the Ditch of the inner Corner, which carry not thither the Water as ſome think, but ſends forth what is there depoſited, and ſuperfluous, from the excretory Veſſels, and received by them, and then it is carried forth of Doors by one Channel, which going thorow the Bone of the Noſe, paſſes thorow its paſſage. This Channel was firſt found out by *Nicholas Stenon*, who has ingeniouſly deſcribed its make and Uſe. *Their Uſe.* *The Lachrymal Kirnel is deſcribed, with the excretory Paſſages.* *Its uſe is hinted at.*

This little Channel, ſtretched forth from the Kirnels of the Eye, thorow the paſſage of the Noſtril, even to its end, is like a Sink, which ſends forth of doors the ſerous filth, apt to be too much poured forth on the Eye, by a ſecret paſſage: Hence is to be noted, that not only in Weeping, excited thorow Grief, but as often as Tears are preſſed forth from the Eyes, by any thing bitingly pulling them, an humidity diſtils from the Noſe. But as to the Veſſels, which are properly Lachrymal, it is obſerv'd, that three or four *Lymphæducts* or water-carriers, reaching from this Kirnel into the Eye-lid, one of them opens into the Margent of the Upper Eye-lid, another into the Margent of the Lower Eye-lid, with a little Dam raiſed in either, and ſend forth the water in Tears or Weeping between the hairs of the Eye-lids themſelves. I have ſometimes ſeen in an Ulcerous diſpoſition of this Kirnel, a filthy Matter to have dropt forth, by Compreſſion, from thoſe two Lachrymal Puncts. *The Lachrymal Veſſels.*

The other Kirnel of the Eye, (commonly nameleſs, but deſerves chiefly to be called Lachrymal) beginning at the leſſer corner of the Eye, leaning on the back of the Eye, under the Upper Eye-lid, is carried forward, almoſt to the inner corner. As to its *A nameleſs Kirnel rather to be called the Lachrymal.*

Figure,

Figure, it is cleft into many Lobes, distinguished by various distances between; from every one of which, water-pipes ascend into the Eye-lids, and opening thorow the Lachrymal Puncts, within its inward Superficies, pour forth water requisite for the watering the Eye, both for its Motion, and for Weeping: The most Learned Doctor *Stenon*, has clearly and sufficiently described this Kirnel also, with the Lachrymal Vessels, and express'd them with apt Figures; whatsoever of superfluous Serum sweats forth through the Lachrymal Vessels of this Kernel, slides into the greater corner, for that it is seated in a steep place, and from thence is sent away, through the same excretory Vessels of the other Kirnel, as it were by a common Sink.

The Vessels of the Kirnels.

Besides these Vessels, carrying the water from the Kirnels into the Eye, and the excretory of its superfluous Humor through the Nose; there belong to the Kirnels of the Eye some others designed for other uses, to wit, Arteries, Veins, and Nerves. From the *Carotid* Artery, gotten within the Skull, and about to ascend towards the Brain, a noted branch being sent into the Compass of the Eye, imparts shoots to either Kirnel, carrying Blood to them plentifully: To this Artery (which besides the Kirnels of the Eye, respects also the chief parts of the upper Jaw) is adjoyned a Vein, which reduces the Blood from them; yea, and to both these a Nerve is added for a Companion, to wit, the *Ophthalmick* Arm of the fifth Pair, which variously binds about and knits the sanguiferous Vessels, with many shoots, sent forth in its whole Progress, and also distributes many little shoots into the Kirnels themselves.

The Matter of Tears.

From these we may easily gather, that from the Blood carried thorow the Arteries to either Glandula or Kirnel, a watry Humor, requisit both for the perpetual watering of the Eye, and also occasionally for the matter of Tears, is sifted forth, and there heaped up, for the aforesaid uses. As to the former, these Kirnels, even as others implanted elsewhere, imbibe the Serum carried to them for constant food; to wit, because the Arteries carry the Blood thither more copiously, than the Reins are presently able to sup back; wherefore what is watery is imbibed by the substance of the Kirnel, as it were a Spunge, the bloody Humor being sent away by the Veins. For this reason, because the Nerves bind these Vessels, therefore as often as the Serum abounds too much in the Blood, destinated for the Brain, these Arteries being provoked by the Nerves, and bound together, it is separated or bolted forth, and carried more plentifully than it was wont, towards these Kirnels.

The Causes of Weeping, and the manner of its being made described.

But as to Tears, oftentimes poured forth in great plenty from these Kirnels of the Eye, that it may the better appear, by what means, and for what Causes this is done, it seems very opportune, to discourse concerning Weeping and Crying, and of the Causes and manner of its being made, which yet shall be done briefly and succinctly, because the more full Consideration of these, properly belong to the Doctrine of the Passions. In the first place therefore, concerning Weeping, we observe that it doth chiefly and almost only follow upon great Passions of the Mind, to wit, great Grief, Sadness, Pity, sudden Joy, and the like; to wit, whensoever the sensitive Soul, being struck by either a disagreeable or unaccustomed Object, is as it were compelled inwardly to shake, or to contract more near together its *Systasis*, or Constitution; so care is taken, that a greater company of Spirits, yea and a more plentiful flux of Blood, are compelled to the principal Parts, *viz.* The Heart and Brain, as it were the stays of Life: The Animal Spirits of their own accord leap forward to these places, as to the two fountains of Life, yea and the Blood is more fully heaped up in either; for as much as the blood-carrying Vessels, being bound together straitly by the Tract of the Nerves, drive forward swiftly to these places its Latex, and take it away, more sparingly from thence; therefore, whil'st an occasion is offer'd of Weeping, presently the Bosoms of the Heart, with the whole Neighborhood, swell up and are hugely inflated, by the Blood there heaped together, and (for as much as it is suffused with abundance of Serum) very much boiling; hence, both the Lungs are stuffed up that they can yield but a sobbing respiration; and the *Diaphragma*, that it might give place to their swelling, is depressed lower, with a stronger and more often repeated *Systole*, which is the Cause of Sobbing; in the mean time, for as much as the Air is hardly blown into the Windpipe, the Lungs and the *Diaphragma* being so distended, and at last hardly returned, that mournful sound in Crying or Lamenting is effected. The parts of the Face and Mouth, composed into a mournful Aspect, aptly answer to this Affection of the *Præcordia*; the reason of which we have shewed elsewhere; because the Nerves which Contract the *Præcordia*, are intimate Relations, and rejoyce in a mutual Sympathy, with those, which pathetically Compose the Face, in Laughing and Weeping. But whil'st these things are acted in the *Præcordia* and Countenance, the business is carried no less tumultuously in the Brain; for here the Spirits being acted in Confusion, all things are upside down, and the Brain, by the too great influx of the Blood, is in danger to be either overturned,

Wherefore a bewailing is oftentimes joyned Weeping.

turned, or drowned; which that it might not come to paſs, and that madneſs follow not upon any Paſſion, the Nerves binding about the Truncks of the Arteries in many places, bind them ſtrongly, and ſo repreſs the flowing of the Blood; and its Liquor being at firſt notably rarified, is thickned ſuddenly, and as it were melted, wherefore its Seroſities running forth like a Flood, are diſpoſed into the Kirnels of the Eye, deſtinated for this buſineſs by Nature: Then, becauſe theſe Kirnels are pulled by the Pathetick Nerves, which are of the ſame ſtock, with thoſe of the Face and *Præcordia*, and are ſtrictly bound together, the ſerous Humors, by reaſon of theſe Paſſions of the Mind, being imbibed by the Kirnels of the Eye, are as it were ſtroked out from thence, and ſo diſtil in ſhowers of Tears.

Wherefore Weeping comes upon ſudden Joy.

From hence a reaſon may be had, why Tears are wont to break forth in ſome, after a ſudden Joy, becauſe in great Joy, joyned with admiration, the ſenſitive Soul enlarges it ſelf very much, and diffuſes moſt amply its *Syſtaſis* or Conſtitution; then as it were fearing a Diſſolution, it again Contracts it ſelf; wherefore, in ſuch an Affection, the Blood flowing forth plentifully into the Brain, blows up all the Veſſels, and by reaſon of its fulneſs diſtends them; then after its Channel being thus intumeſied, the ſame Veſſels being preſently bound hard together, ſuffers a Flux, and as it were growing liquid, plentifully depoſes its Seroſities into the aforeſaid Kirnels.

Why Mankind only or chiefly Weep.

There remains another Conſideration about Weeping, why Men or Man Kind only, or chiefly in bewailing, are wont to weep, or to ſhed tears? even for the ſame reaſon, which is given for Man's being a viſible Creature, makes him fit for Weeping: To wit, Man is more fitly made for all Affections, and chiefly for the conceiving of Joy and Sadneſs, than Brute Animals; and as he is a ſociable Creature, he ought to Communicate thoſe ſociable things, ſome ſigns naturally implanted in him, to wit, Laughing and Weeping: But as to the Organs, which perform theſe Kind of Affections, we have elſewhere obſerved, that there happens in Man, otherways than in Brutes, a wonderful conſent between the *Præcordia*, and the parts of the Mouth and Face, by reaſon of the Conformation of the intercoſtal Nerve; ſo that as ſoon as ſadneſs poſſeſſes the Breaſt, preſently the Aſpect of the Face, correſponds with the ſame Perturbation.

The Muſcles of the Eyes and their uſes deſcribed.

Thus much for the Kirnels of the Eye, and their Uſe and Action: Among the intrinſecal Parts of this Member, next follow the Muſcles, concerning which, there is ſcarcely any thing rare to be met with, or that has not been already taken notice of by others. It is obvious for any to conceive, that ſo many Muſcles ought to be conſtituted, as there are Kinds of ſpreading abroad, by which this Globe may be moved, as it hangs within the Compaſs of the Bone; for this is made after a fourfold way or manner; to wit, on that ſide and this ſide, upward and downward, and two ways obliquely, *viz.* By bringing it about both towards the outward, and inward corner.

Four ſtrait, two oblique.

For theſe ſeveral Kinds of Motions are conſtituted ſo many diſtinct Muſcles, which are found almoſt in all perfect Animals, and are eaſily ſeen in the diſſection. Four ſtrait Muſcles are inſerted into the Cardinal ſpaces of the Eye, to wit, the Muſcle lifting it up, and preſſing it down, its *Zenith* and *Nadir*, and drawing to, and putting from, as it were poſſeſſing the oppoſite points of the Horizon, to wit, Eaſt and Weſt; the oblique Muſcles compaſs it about like a Sphear, towards the Exterior and the Interior corner. I paſs by here, that the Muſcles of the Eye, do change their Names, according to the Paſſions of which they are Marks; wherefore, that lifting up, is called Superb or Proud, becauſe that in Pride, it holds the Eye elate or lifted up, which however is more true of the Eye-lid, and that Muſcle deſerves rather the Name of Holy and Devout, becauſe it greatly lifts up the Eye in ſtrong Prayer; wherefore it is the manner of Hypocrites, who affect the Habit of Sanctity, ſo to role the Eyes about, that they hide the Pupil of the Eye, and turn up the white to be ſeen: The depreſſing Muſcle, by its action ſhews the mark of an humble, abject, and often of a Pious Mind alſo; that drawing inward, may not be improperly called Drunken, becauſe Drunkards drawing their Eyes towards the inward corner, are wont to look aſquint; and when one Eye is drawn in more than the other, for that by this means the Pole of the Sight is varied, they behold things as if they were double. I knew a young Man, obnoxious to the Palſie, when the drawing in Muſcle was ſtrongly drawn, the other Muſcles of the left Eye being looſe, by reaſon of the Eye being thus diſtorted, every object appeared double, nor could he diſtinguiſh the true one. The Muſcle drawing from or outward, may be well enough called the Indignator, to wit, becauſe in ſuch an Affection, we bend our Eyes outwardly, with a certain averſion. The oblique Muſcles may be called Amatory, becauſe Lovers behold one another obliquely or ſide-ways, and as it were fearing the direct Sight of one another, they role about their Eyes like thoſe of Cattel; hither and thither.

A Conſent, and Sympathy, between them all.

That the Eye might rightly perform the Act of Seeing, there is required a Conſent or Harmonious acting, between all its Muſcles; to wit, that all acting together, may keep and continue its Globe, like the Tube of an Optic Glaſs, in a juſt Poſition for Seeing; for if any Muſcle overcoming its Antagoniſt, acts more ſtrongly than it ought, and draws the Eye too much to its part, preſently the Sight becomes diſtorted; and by this means it is, to wit, by reaſon of overmuch ſtrength of ſome one Muſcle, whether it ſo happens by a Diſeaſe, by Nature, or by an evil Cuſtom, that ſome are goggle-eyed, or have them diſtorted or ſquinting; For ſquinting is wont to be cauſed by the fault of any one of the aforeſaid Muſcles; but eſpecially the Muſcle going about to the inward corner would indanger the bringing in of this Vice, by its exorbitances, unleſs prevented by Nature; for as divers viſible Species, being ſent from Objects at a great diſtance, are received together by the Organ, every one is apt to turn about their Eyes, bending them forward: wherefore Infants, when many things at once are held before their Eyes, eaſily are brought to ſquinting. But leſt this Muſcle, inordinately rolled about, ſhould cauſe in many this Evil, it is prevented with a wonderful Artifice, that its Motion may be ſtill kept within juſt limits; becauſe, near the root of the Noſe is hung a certain handle, like a Pully, which this Muſcle paſſing thorow, there is a neceſſity for it to perform its traje-ction at a certain Angle, and as it were within a determinate compaſs.

Whence ſquinting comes.

Some Brutes are furniſhed with other two Muſcles.

Beſides theſe ſix Muſcles which Man enjoys, and no more, and which are common to other perfect Animals, as well as him, ſome Brutes are furniſhed with two others for their peculiar uſes. It is obſerved, that four-footed Beaſts, who carry their Eyes prone or hanging down towards the Earth, have a peculiar Muſcle, which holds up the Globe of the Eye, and which ſuſtains it, leſt by its weight it ſhould be apt to ſlip beyond the compaſs of the Bone: with this Muſcle are indued Kine, Horſes, Sheep, Hares, Swine, and perhaps many other Animals, alſo a Dog is furniſhed with this, but has it made after another manner; but to many who have the aforeſaid hanging Muſcle of the Eye, is granted another Membranous Muſcle, which being placed nigh the inward corner of the Eye, when it is lifted up, hides almoſt the whole Globe of the Eye. The uſe of this ſeems to be, that when Beaſts thruſt their heads to feed among high Graſs and Herbs, this Muſcle hides the Pupil of the Eye, leſt any thing ſhould hurt it. The former Muſcle is wont to be called the Seventh of Brutes, and this, that by which Brutes twinkle their Eyes.

The Globe of the Eye, with the Optic Nerve.

After that all the Muſcles, with the Kirnels and the fat lying between, are ſeparated from the Eye, its Globe remains naked, with the Optic Nerve inſerted about its bottom: This Conformation, as we have formerly obſerved of the Brain, is after one manner in Man, and four-footed Beaſts; and after another in Birds and Fiſhes: for in theſe the whole compaſs of the Eye is not round, but depreſſed nigh to the more outward, and the poſterior Superficies; and almoſt like to a Platter or Shield rather; but in the others, being perfectly round, it imitates the Syſtem it ſelf of the World: The reaſon of the difference is eaſily known, by the divers framing of the Eye, which we ſhall ſhow anon.

Its Figure in ſome is round, in others depreſſed.

We meet alſo with another notable difference in the Eyes of divers Animals, about the inſertion of the Optic Nerve, for in Man, a Dog, and other more ſagacious Creatures, the end of the Optic Nerve is placed directly before the Pupil, or is inſerted to the Pole of the Eye it ſelf: for the Beam, or the Optic Pole, paſſing thorow the Pupil or Apple of the Eye, and its middle Cavity, falls into the inſertion of the Optic Nerve; but in a Sheep, a Calf, and many other four-footed Beaſts, and beſides in all Birds and Fiſhes, the inſertion of the Optic Nerve being made in the Den of the moſt inward circular Cave, or ſide of the Hemiſphear, is at a diſtance from its Pole, even as the Pole of the *Zodiac*, from the other of the *Equator*. This difference Dr. *Scheinerus* not perceiving, when he had found the Optic Nerve to be inſerted into the ſide, in the Eyes of great Cattel, Oxen, and Swine, two ſoon concluded, that it was ſo alſo in Man, and in all Creatures beſides; for he ſays in his Third Book, *Fundam. Optic.* p. 11. *That the Optic Pole does not fall into the Optic Nerve, with any Proportion*, the error of which Aſſertion, the Anatomy of a Man's, or a Dog's Eye, eaſily diſcovers.

The Inſertion of the Optic Nerve, is after a divers manner, in divers Animals.

It is placed either in the Pole, or at the Side of the Eye.

The reaſon of the divers Conformation inquired into.

If the reaſon of this diverſe Kind of Conformation be demanded, we ſay, that the Primary Organ of the Sight, to wit, in which the Image or viſible Species ſtays, and from whence it is delivered to the firſt Senſory, is not the Optic Nerve, but the *Retina*, netty Coat, or fifth Membrane of the Eye, on every ſide ſpread out, by the Inſertion of the Optic Nerve. Further, the Image projected within the bottom of the Eye, does not conſiſt in the ſmall Punct, neither is it determinated to the ſame individual ſpace, but being variouſly drawn forth, is painted now bigger, now ſmaller, upon the *Retina*, or fifth Coat of the Eye; yet ſo, as being placed nigh to the inſertion of the Optic Nerve, it may preſently be carried by it to the Common Senſory; when as therefore the

the Optick Nerve is placed in the Pole of the Eye, the Images disposed round about upon the *Retina*, from every part of it, do fill the whole Circle of the painted Scene. But when the insertion of this Nerve, declines from the Pole, to the side of the Eye; the apparition of the Objects stands only below, and not at all above that Punct, and so the whole apparition of visible things, is concluded within a Semi-circle. This is clear to any thinking Person, that it is fit for some Animals, that they receive many Objects at once, at one view, and that others but a few only; therefore the Optic Nerve, for the former, ought to be inserted about the middle of the Eye, and for these latter towards its side. Man, a Dog, an Horse, and perhaps some other Animals, wont to be employed with various Matters, ought to behold all things in the whole Neighbour-hood placed together: but a Sheep, Ox, Hog, and many other four-footed Beasts, and universally Fowls and Fishes, to wit, such whose chiefest task is to get their Victuals, and to defend themselves from Enemies, have no need to behold the whole Horizon, but only things placed near on the right and left hand; altho perhaps in some of these, the paucity of the Objects, is compensated with the sharpness of the Sight.

The Pupil of the Eye in some round, in other longish.

There is observed another no less noted difference in several Animals, about the Pupil of the Eye; for this is round or spherical in Man, a Dog, and in many other four-footed Beasts, in all Fowls and Fishes; but in an Ox, great Cattel, a Goat, and some others, it is oblong, like a great cleft; the reason of this difference seems to be, because that by a Man that is upright, and other Animals that are wont to lift up their heads, and to look round about on every side, many Objects, coming from both above and beneath, and from either side, out of the whole Hemisphear, are received by the Sight; wherefore the Pupil of the Eye ought to be round, that the visible Species sent in from every side, might be admitted in a round form: But Oxen, Cattel, and other Animals, almost always carrying their Heads prone, and hanging down, need only to behold such things as are presented before them, or a little of one side: wherefore, the Pupil of the Eye is depressed, and somewhat long, for the receiving the visible Species, that are only shown at hand. Further, another difference is noted, about the colour of the Ball or Pupil it self, which in Man, and in all Fowls and Fishes is perpetually black, but in four-footed Beasts, it is either grey, or blewish, like the Sky, or of a shining red, or of some other Kind, which colour notwithstanding being fixed, not in the Horney part, but in the Concave of the *Crocoideos*, shines thorow all the Humors into the Pupil. Concerning the reason of this, we may believe, that those indued with a black Pupil, see more clearly by day-light, because indeed the Image is rendred most perspicuous to the Eye, as it were in a Chamber wholly dark, but by Night they discern little or nothing at all of any Objects; on the contrary, we have observed, those furnished with a blewish, or grey, reddish, or some other shining Pupil, not to see so clearly in the day time, but much better in the night than the former; to wit, because that shining Colour of the Pupil, illuminates something the Cloyster or Optic Chamber of the Eye, that fewer Beams being there gathered together from the darkness they might constitute the visible Image.

The reason of this inquired into.

The Colour of the Pupil in some black, in others gray, reddish, or otherways Coloured.

The reason of this shown.

The Parts of the Eye, are the Coats and Humors.

These things concerning the Fabrick of the Eye, and its divers manner of furniture, in various Animals, being thus premised, it now remains, that we shew its Anatomy, and that we unfold its several Parts, and the uses of the Parts. We have already mentioned, what also is known to common Observation, that the Eye consists of Coats, and Humors. The Coats or Membranes are as the containing Bodies, and constitute the walls of the dark Chamber, with the little Window, and the Paper for the receiving the Images; but the Humors, are as *Dioptrick* Glasses, so placed within the hole of the dark Chamber, that they aptly break, and gather together, the Beams exhibiting the Images.

The Coats greater or lesser.

The Coats of the Eye, like the Sphears of a Globe, are either Greater, which are stretched forth thorow the whole Compass, or its greatest part; or Lesser, which contain, or include the particular Humors.

The greater are three.

The greater Coats of the Eye are three; which seem in some measure to arise from a threefold Substance of the *Optick* Nerve; for in the Trunk of the Optic Nerve, may be found an Exterior Coat, arising from the *Dura Mater*, with which it is included as with a sheath; Another more inward, cloathing the Membrane, lyeth under this, arising from the *Pia Mater*; and within these Coats are found very many Fibrous Nerves, gathered together into one bundle. But this Nerve, being continued, to the Compass of the Eye, its Exterior Coat being much inlarged, and stretch'd out into a round inclosure, constitutes the outmost Wall of the Eye: This Coat, by reason of its hardness, (because it is strong, and is in the place of a defence against Injuries) is called the *Sclerotick*: The hinder part in most Animals is thick, and spacious, except that in a Dog, and perhaps in

The Sclerotick.

ſome others, it is thinner, and in ſome meaſure clear; but the Anterior part of this Membrane, that it may tranſmit the viſible Species, is tranſparent and ſhining in all. But leſt this ſhould admit more forms than it ought, (by having a too broad, and too large a tranſparent opening) and ſo too confuſed together; another Coat, ariſing from the *Pericranium* grows to it, and covers it; excepting a hole left for the Pupil: This, from its Colour, is called the *Albugina* or the White, for beſides that it determines the aperture of the *Cornea*, or horny or third Pannicle of the Eye, it firmly ties the Eye alſo to the ſides of the bony Compaſs. The additional Coat, or the white Tunicle, beſides the proper Membrane, is made up alſo of Tendons of Muſcles, ſpread into a moſt thin Net; therefore, alſo it becomes white, becauſe, when many diaphanous Membranes are thruſt together, like thin cakes, they cauſe a ſhaddowing, and with it a whiteneſs, as may be perceived in the Bones and Horns of living Creatures, made up of a Pellucid Glew, alſo in the white of an Egg made hard by Boyling.

The Albugine grows to this.

The Figure of the *Sclerotic* Coat, is proportionate to the quality and diſpoſition of the Humors, which are contained in the Eye; wherefore, in ſome (as we hinted before) it is round, in others preſs'd down, but in moſt its Anterior Part ſwells up, above the remaining Part of the Ocular Globe, by reaſon of the Watry Humor underneath, as it were a Portion of the outward Sphear, to wit, for this end, That the Compaſs of the whole viſible *Hemiſphear*, may be received together, by the Eye, as it were by a Convex Glaſs.

The Sclerotic Coat, is in ſome round, and in others depreſſed.

As to the Veſſels which are inſerted into this Coat, beſides the ſhoots of the Nerves, ſent from the fifth Pair, after they have bound about the Trunk of the *Optic* Nerve, they are beſtowed on the bottom of the *Sclerotic*, whoſe Uſe or Office ſeems to be, variouſly to carry the Optic Nerve, with this outmoſt Cheſt or cloſure of the Eye, and to Compoſe it for the receiving the Species; there are alſo granted to this, noted Arteries, from the Trunks of the *Carotides*, before they reach to the Brain. It is obſerved, that the Artery deſtinated for this, falling in, nigh to the Trunk of the *Optic* Nerve, imparts to the ſame, in its whole progreſs, ſome ſmall Shoots, which are certainly ſufficient for Heat and Nouriſhment; then this Artery, ſpread forth at the bottom of the Eye, is divided into ſix Branches, like ſo many little Rivers, all which being brought upon the *Sclerotic*, towards the *Cornea*, divide the Exterior Globe of the Eye into ſo many equal and diſtinct Regions; from theſe, many little ſhoots, going thorow the *Sclerotic*, are inſerted into the *Uvea*, and after a ſort knit this to the other: The Arterous branches and ſhoots, are every where accompanied with Veins, by which the Blood is reduced towards the wonderful Net, and at length into the Trunk of the hollow Vein.

The Veſſels of this Coat.

Within the *Sclerotic* Coat, or the outmoſt Coat of the Eye, follows the *Chorocoeides*, and is almoſt thorow the whole, Contiguous with it, and coheres to it, by ſome Fibres, and blood-carrying Veſſels; this being perforated in the fore-part, leaves an opening for the Pupil of the Eye, which notwithſtanding, as occaſion requires, is wont to be either contracted or dilated. This Coat, being black in moſt Animals, is covered in the Superficies or Convex, or Concave, as it were with a black Paint, which is alſo fixed to the other contiguous Coat; the reaſon of this is, that it might render the inward Chamber of the Eye black or dark: But in ſome Animals, to wit, in moſt four-footed Beaſts, a certain Interior Portion of the *Chorocoeides*, which is turned over the Pupil, ſhines with a diverſified Colour, like the Rainbow, and according to this, the Pupil of the Eye ſeems to be coloured: but as this is wanting to Man, his Pupil is always black, according to the whole Picture of the *Chorocoeides*: But it appears otherways in a Dog, and otherways in a Cat, Ox, and the reſt. In thoſe alſo that have the Pupil round, this Signature is expanded round; thoſe who have the Pupil ſtretched forth at length, like a chink, this Picture being as it were double, ſtands on either ſide of the Optic Nerve: The uſes of this (as we ſaid but now) is to illuminate the Pupil of the Eye, as it were with an inward Beam, that it may be able to behold things by Night, and placed in the dark; wherefore it is very ſhining in a Cat, but is wholly wanting to a Man, Birds, and Fiſhes.

The Coat Chorocoeides.

Is black in moſt Animals but not in all.

A Portion of this, in moſt Brutes, is of a diverſified Colour, otherwiſe than in Man. The reaſon of this is ſhown.

Nigh to the opening of the Coat *Chorocoeides*, ſtands the Rainbow of the Eye, that is, nigh to the outmoſt border of this Coat, where the opening is for the Pupil, a certain Fringe, made up of Nervous Fibres, diverſly coloured and diſpoſed, covers it: Theſe Fibres are called the *Ciliare* Proceſſes, which like brows of hairs, being carried from the Pupil of the Eye, like rays from a luminous Body, are diſpoſed into an Orb; Theſe Fibres being placed in a thick row, are noted with a variegated or diverſified Colour, outwardly, where they ſtick to the Corneous or horney Coat; in the mean time, where they are Contiguous to the brim of the Chryſtalline Humour, and alſo to the border of the *Retina* Coat, they always appear black: Theſe *Ciliare* Proceſſes, do not only dilate and contract the Pupil of the Eye, but alſo they thruſt forward, or draw backward the Chryſtalline

The Rainbow of the Eye is deſcribed, and its uſe declared.

Chryſtalline humour, and bend it hither and thither into the view of the Objects. Further, there is in theſe Coloured hairs, or the Rainbow of the Eye, a certain vigor, and mighty conflux of Animal Spirits, by the Exertion of which, the Eye ſeems to beam forth, and to caſt forth outwardly certain darts like Lightning, according to the Inſtinct of the Paſſions: yea, hence we ſuppoſe Light to be diffuſed, and to illuminate the Medium; for which reaſon, Men diſcern in ſome meaſure Objects in the dark. I knew a certain Man, indued with an hot Brain, who after a plentiful Drinking of Wine, was able to read diſtinctly, in a very dark Night; the reaſon of which ſeems to be, becauſe the Animal Spirits, being as it were inflamed, and ſo beaming forth from this Rainbow, did illuminate the Medium, with an implanted Beam. Moreover, when by any ſtroke on the Eye, an apparition of flame, or ſhining appears; ſurely this proceeds from a ſudden Concuſſion, and Exploſion of the Spirits, lying within the *Ciliar* or hairy Proceſſes. If it be demanded, by what paſſages the Animal Spirits run into theſe Fibres, we ſay; That from the Nerves of the ſixth Pair, which bind about the Optic Trunk, certain ſhoots, entring the *Sclerotick*, and the *Corocoeidal* Coat, come alſo to theſe Parts; beſides, the *Retine* Coat, which is wholly Nervous, ſticks to this Rainbow.

The ſtrength and irradiation of the Eye from the Rainbow.

The Animal Spirits actuate it very much.

Within the *Chorocoeides* or the *Uvea*, another Coat follows, whoſe Compaſs as it is leſs, ſo it is ſhorter in breadth; for its Border, ſubſiſting about the lower brim of the Chryſtalline Humor, is Contiguous to the lower Border of the Rainbow, and in ſome part ſticks to it: This Coat, as it is white, ſo it is Medullary, and ſaid to proceed from the Medullous and Fibrous Subſtance of the Optic Nerve, ſo that what is there of Nervous Fibres collected into a little bundle, is here like a Veil ſtretch'd forth of a Net-like form. Indeed, if the whole Eye may be taken for the Flower which grows in the Brain, thorow the Optic Nerve as its ſtalk; The *Retine* Coat is the Flower it ſelf, and the two former, but the Stalk and Cup. The *Retine* Coat therefore being ſpread forth within the Chamber of the Eye, or its inmoſt Conclave, is like a white Wall, which receives and repreſents the viſible Species, admitted thorow the hole of the dark Chamber; for doubtleſs this part, however Medullary and Fibrous, and ſo greatly akin to the Brain, and to the Optick Nerve it ſelf, is the proper Organ of Seeing; to wit, on which the ſenſible Species is impreſſed, and from which the ſame is communicated to the chief Senſory; which ſhall more plainly be manifeſted anon, after we have unfolded the Humors of the Eye.

The Retine Coat.

Its deſcription and uſe.

Agreeable to the three Coats of the Eye, there are ſo many Humors of it, to wit, the Watery, Chryſtalline, and Glaſſy: The Chryſtalline Humor ſupplies the place of the Burning-Glaſs, placed within the whole of the dark Chamber, and the two other Humors, conſtitute and fitly determine, the ſpaces only, or places between, which ought to come between the firſt approaches of the beams into the Eye, and the place or Organ of Sight, wherefore this is put behind, the other before the Chryſtalline Humor.

The Humors of the Eye Three.

But this Chryſtalline Humor it ſelf, within the aperture or opening of the *Uvea* Coat, like a Glaſs placed before the hole, gathers together, and breaks the Beams coming thither on every ſide: The Subſtance of this is very ſhining, like glew, or the Gum of a Tree, and is indued with a Conſiſtence like melted wax, yet if preſſed it will not willingly flow forth. Its Figure in Man, and moſt four-footed Beaſts, comes near to the ſhape of a Lentil, whoſe utmoſt Superficies is more plain, and the innermoſt more gibbous or bunching out; but in Fowls and Fiſhes, its Figure comes near to a Spherical ſhape; In theſe later, where the Chryſtalline Humor is round, the whole Figure of the Eye is depreſſed in either; But in the other, where the Chryſtalline Humor is of a depreſſed Figure, the Eye is found to be plainly Spherical. A reaſon of the Conformation of either, ſhall be ſhown afterwards: The Chryſtalline Humor, thô not apt to flow forth, yet is included with a proper little Membrane, for the Lightneſs of it, called the Cobweb.

Chryſtalline.

Its deſcription and uſes.

In Man, and in four-footed Beaſts, thô the Chryſtalline Humor be of the form of a Lentil, it doth not bear out enough, ſo as it might receive the Beams of the whole Hemiſphear, therefore the watery Humor is lay'd to it, as an addition, which thruſting forth the Cornea, or horny Coat, and rendring it more bunching out, encreaſes outwardly the Convexity or bending forth of the Eye, which is indeed, that the viſible Species might be from this place, and from that, and on every ſide more plentifully admitted into it, as into a Window, made forth or butting out beyond the plane of the Wall. Further, the watery Humor ſwelling forth with the horny Coat, breaks a little the oblique Beams falling towards the Perpendicular; and ſo compelling them nearer together, directs more together into the Convexity of the Chryſtalline ſwelling. There is yet another uſe of this watery Humor, to wit, to temperate the Beams paſſing thorow

The watery Humor, and its uſes deſcribed.

thorow it, being ſometimes ſomewhat fiery, and ſo to render them more proportionate to the Senſory.

The glaſſy Humor. On the other ſide of the Chryſtalline Humor, to wit, on the back of it, the glaſſy Humor ſtands, like to fuſed Glaſs; this, much more plentiful than both the other, poſſeſſes the greateſt part of the Optic Chamber; alſo, being leſs Compact in it ſelf, is apt ſomewhat to flow out, and is included with a moſt thin little Membrane: this lyes upon the *Retine* Coat, and contains the Chryſtalline within its Boſom. Its Primary uſe is to ſeparate the *Retine* Coat in a juſt ſpace from the Chryſtalline Humor, that after the Beams have paſt thorow this, as it were thorow the Burning-Glaſs, with a due Refraction, they may have in that, placed at a juſt diſtance, their habitation: Hence, in thoſe who have the Chryſtalline Humor in the form of a Lentil, and ſo the Beams paſſing thorow, can't come together but at a greater diſtance, have great plenty of this glaſſy Humor, and its plenitude cauſes the Spherical Figure of the Eye; But in thoſe, who have the Chryſtalline ſwelling round, that the Beams paſſing thorow, are more crooked, and have a dwelling or neſt at a leſs diſtance, the quantity of the glaſſy Humor is found leſs; and its defect cauſes the depreſſed Figure of the Eye, or of the form of a Cheeſe. Further, the glaſſy Humor, according to *Scheinerus*, being ſomewhat a more thin Medium, than the Chryſtalline Humor, breaks a little the Beams paſſing thorow, from the Perpendicular, and therefore ſomewhat enlarges or draws forth the Picture of the viſible thing, otherwiſe more contracted, and ſhews the ſame more conſpicuous in the *Retina*. Thus much concerning Seeing, and of all the Senſes; in the next Chapter, we ſhould ſpeak of the other Power, to wit, the Locomotive: but being we have formerly largely diſcourſed concerning that; we ſhall handle in the following, certain Affections, belonging to the Corporeal Soul, as to the Exerciſe of the Motions and the Senſes, to wit, Sleep and Waking.

Its uſes.

The Plenty of the glaſſy Humor varies, according to the Figure of the Chryſtalline Humor.

CHAP. XVI.

Of Sleeping and Waking.

Sleep Neceſſary for all Animals. SUch is the weak and inſtable Nature of all living Creatures, that they are not able, neither to Live perpetually, nor to Act and Labour continually; but that there is a Neceſſity for them (even as once, and at laſt to dye ſo) daily to repeat frequent turns of Sleep, as it were ſo many previous Monitors of Death. Though we have not experienced it, we eaſily know what it is to dye; to wit, when the vital Flame, like a Lamp, is either by degrees conſumed, or violently extinguiſhed, preſently Heat and Light, and what flow from them, both all the Vital and Animal faculties, are aboliſhed. But what is the formal Reaſon, Eſſence and Cauſes of Sleep, which we ſuffer, and daily experience, is almoſt wholly unknown. Concerning this, there are various Opinions, both of Ancients and Moderns, but they rather ſeem Dreams, than ſatisfactory Reaſons: To wit, whil'ſt ſome affirm Sleep to be mere Privation, others a Bond of all the Functions; theſe place for its Cauſe a retraction, or introceſſion of Heat, thoſe an aſſent of Vapours from the Stomach to the Head. Some aſſign for the ſubject the Brain, others the Heart, others the Stomach, and Spleen; and ſome again the Soul, others the Body by it ſelf; and laſtly, others both together, to wit, the whole Animal Body.

What it is unknown, or greatly Controverted.

The Opinion of Schneiderus. Among the latter Writers, *Conradus Schneiderus* hath of late been Eminent, who rejecting the Opinions almoſt of all others, and aſſerting Sleep not to be produced from Vapours, nor from any material Cauſe; nor to depend, either upon any affection of the Brain, or of any other part; affirms it to be, and Waking alſo, mere faculties of the Soul; to wit, innate, or born in it, and wholly inorganical. Alſo he ſaith, that the formal Reaſons of either are, that the Soul, or its animadverſive Faculty, ſometimes withdraws, and as it were hides it ſelf; and ſometimes puts forth, and expunds it ſelf. This Opinion, thô in ſome part it ſeems likely, does not eaſily deſerve our aſſent, becauſe, notwithſtanding he aſſerts Sleep and Waking to be proper Faculties of the Soul, and theſe inorganical and independing of the Body, he further ſuppoſes, other chief Powers of the Soul, to wit, common Senſe, Memory, and Appetite, not to be performed from the divers Organs within the Brain, nor to be diſtinguiſhed by their Seats, but to be diffuſed thorow the whole Body.

He affirms Sleep to be an inorganical faculty of the Soul.

Therefore,

Therefore, that we may the more rightly Philoſophize concerning Sleep, we ought to conſider, what are its Subject, formal Reaſon, Cauſes, Differences, and Effects.

The Subject of Sleep, not the whole Body.

Firſt, As to the firſt it clearly appears, that Sleep is not extended neither to the whole Soul, nor to the whole Body: for the *Præcordia*, and Organs of reſpiration, are exerciſed with a perpetual *Syſtole* and *Diaſtole*, the Viſcera, dedicated for Concoction, perform their Offices more, and better in Sleep than in Waking: Further, when as the aforeſaid Parts are wont to alter their actions, according to the urgencies of evident Cauſes, (as may be argued by the Pulſe and reſpiration variouſly changed, alſo from Vomiting, and ſometimes a ſudden looſning of the Belly) the exerciſes of the ſenſitive Power, as well as the Motive, ought to be granted to them in Sleep: But the Blood is circulated, and flames forth in quiet, the nouriſhing and Nervous Humors are diſpenſed, yea, and the ſuperfluous, and what is excrementitious, are beſt ſeparated or put forth: Hence, as it appears, perpetual watches are kept about the midſt, or inmoſt part of the Animal Body. In the mean time it is obſerved, that Sleep urging, all the External Senſes are ſhut up, alſo that all Spontaneous Motions whatſoever ceaſe; ſo that the Bodies being wholly ſubjected to eaſe, lye as they were dead. Further, the Internal Powers, related to theſe, ſuch as are the Common Senſe, Phantaſie, Memory, Appetite, conſpire together with theſe External Powers, and either wholly omit their Acts, or exerciſe them but obſcurely and confuſedly.

The Animal Spirits are the immediate Subject of Sleep.

From theſe it may be plainly gathered, that the Animal Spirits, which are the next or efficient Inſtrument of Senſe and Motion, are alſo the immediate Subject of Sleep; but, not all of them, but ſome Bands, as it were of a Superior Order, at thoſe times keep Holy-day; but others, whoſe task is more aſſiduouſly required, for the Preſervation of Life, are wholly inhibited.

All the Spirits enjoy reſt, but not in Sleep.

Concerning theſe, that the reaſon of the difference may appear, and that the bounds of Sleep may be defined, we muſt note, that there is need for all the Animal Spirits (which conſtituting the *Hypoſtaſis* of the Corporeal Soul, perform all its Functions) becauſe they cannot inceſſantly exerciſe, or ever continue their Acts, to have frequent intermiſſion; by which, being worn out and tyred, they might be refreſhed: notwithſtanding there is not granted a Vacation or reſt to the Spirits of every Regiment, after the ſame manner, nor in the like dimenſion.

The Spirits only ariſing from the Brain, and who are the Authors of voluntary Functions enjoy Sleep.

For the Animal Spirits, which being born within the Brain, there conſtitute the chief Faculties of the Soul, and from thence flow into the Nervous ſtock, for the performing of the Spontaneous Acts of Senſe and Motion, and effect the more hard and laborious tasks, are not tyed to the continual performance of them, but are permitted, after hard labours, to lay aſide their work, and as it were to be idle; ſo that the Privilege of Sleep properly pertains only to theſe. But as to the Animal Spirits of the other Kind, which being procreated within the Cerebel, and there receive and emit the Inſtincts, and forces of Senſe and Motion, merely Natural; and from thence flowing into the *Præcordia* and *Viſcera*, perform the more aſſiduous Offices of the Vital and Nutritive Function; I ſay, that the Labours of theſe are more eaſie, and leſs laborious; but as they are abſolutely neceſſary for the preſerving of Life, that they ought not almoſt at any time to lye ſtill, therefore the aforeſaid Spirits, being buſied about theſe Offices, are not ſuffered to keep Holy-day long, and to indulge themſelves with Sleep, but it is ſufficient for them, to intermit their tasks for a ſhort ſpace, and preſently to reſume them, and ſo to have, in ſtead of a longer Vacation, ſome broken times from their Labours: as chiefly appears from the pulſe, and breathing, in which the times of motion and of reſt, are reciprocal, and almoſt equal. Indeed the Spirits performing theſe tasks, ſeem as if condemned to the Stone of *Siſyphus*; to wit, that they ſtill lift up the ſame burthen, then reſting whil'ſt it ſlides down again, they preſently, and ſo perpetually, repeat their Labour. Further, whil'ſt that the Animal Spirits influencing the *Viſcera* of Concoction, propagate the Acts of Vermiculation, from Part to Part, receive and give place to motion, and reſt mutually in themſelves; which alſo is more amply performed when we Sleep ſoundly; in ſo much, that ſometimes the work of more difficult Concoction, is not to be done but in Sleep. Therefore the Empire of Sleep chiefly and almoſt only belongs to the Animal Spirits, inhabiting the Brain, and the Executors of the Animal Function there, (of whoſe Acts we are knowing) and in the Appendix both Medullary and Nervous. If thoſe Spirits ariſing from the Cerebel, as influencing ſome Pathetick Nerves, to wit, of the fifth and ſixth Pair, ſeem to participate of Sleep, that happens by a conſent, deliver'd from the Brain; to wit, by which the Commands, as of Motion, ſo of reſt are conveyed to them.

Not thoſe Procreated in the Cerebel.

The immediate Subject of Sleep, is the Knowing Part of the ſenſitive Soul.

We affirm, That the immediate Subject of Sleep, is the greater Portion of the ſenſitive Soul, which being rooted in the Brain, and thence diffuſed into many Parts of the Body, is the Author of every Spontaneous Motion: But the Mediat, the Brain it ſelf, and

and all the ſenſible and moving Parts, which Communicate with it. Alſo, on the contrary, the other leſſer part of the ſenſitive Soul, which being rooted in the Cerebel, and thence ſtretched forth into the *Præcordia*, *Viſcera*, and ſome other Bodies, is the Parent of the Vital and merely Natural Function, to wit, of whoſe Acts the Animal is not conſcious, is freed from the Bonds of Sleep.

The Mediate are the Bodies containing it.

The formal reaſon of Sleep.

From theſe, that we may proceed to deliver the formal Reaſon of Sleep, let us conceive, that this greater portion of the ſenſitive Soul (the Animal Sleeping) doth lay aſide its expanſion like a Veil, ſinks within it ſelf, and hiding its head, as it were within its own Boſom, ſees nor cares for nothing, that is without; ſo that both the Emanation of the Spirits into the globous Part of the Brain, and alſo their irradiation, into the Nervous ſtock, ceaſing; the Act of ſpontaneous Senſe and Motion, both outwardly and inwardly, is ſuppreſſed.

The beginning of Sleep, is in the Cortical part of the Brain, which is alſo the ſeat of the Memory.

If it be demanded, in what Part or Region theſe Spirits dwell, who firſt of all poſſeſs Sleep, and begin to be indulged with reſt, before any others, it may be well ſuppoſed, that the Spirits firſt Sleeping, are thoſe, which flowing within the globous part of the Brain, create the Acts of the Fantaſie and Memory. To wit, theſe, either of their own accord, or by reaſon of the incourſe of Strangers, falling down from the Pores of the Exterior Brain, in which they were wont to expatiate, convey themſelves into its more deep Marrows, or middle Parts, where as it were lying down idely, intice the Spirits there implanted to the like ſlothfulneſs; and from thence flowing into the Nervous ſtock, recall others from their Efflux, and ſolicite them to idleneſs. Indeed, the Spirits irradiating the outer Brain, do firſt of all grow ſtupified, and begin Sleep in their receſs, as appears from hence, becauſe there is a Neceſſity, for theſe ſometimes to be repreſſed from their expanſion, and to be driven inwards, that there may be a place left, for the inſtilling the Nervous juice, or matter for new bands of Spirits, into the Brain; wherefore, thoſe veterane, or old ones, being not only wearied, go from their Station, but being as it were drowned by the Humor, plentifully ruſhing in, are compelled from their watches.

The Cauſes of Sleep: Firſt, what the final is.

From theſe things it will not be difficult to aſſign the Cauſes of Sleep; and firſt, that we may begin with the Final; (which is always the Key to the reſt) If it ſhould be demanded, for what end, the Animal Spirits going out of the globous part of the Brain, into its middle or marrowy Parts, are bound up with chains of Sleep, and ſo after a ſolemn manner, alter the viciſſitudes, as of Exerciſe, ſo of Reſt; this eaſily occurs; that the Animal Spirits (at leaſt thoſe who are wont to be more ſtrongly exerciſed) leſt they being wholly looſned ſhould periſh, and break the *Hypoſtaſis* of the Soul, want for the ſuſtaining of themſelves a twofold prop, to wit, Reſt and Food; by the former care is taken, leſt the Spirits, for that they are highly volatile, ſhould be very much drawn aſunder, by too much Occupation, and acted into Confuſion: wherefore, after that they have long and much laboured, they deſire to reſt, and be at quiet of their own accord; then by the other, to wit Food, the waſtings both of themſelves, and of the ſpirituous Liquor, with which they are waſhed, are repaired; therefore needful for them: But both theſe benefits, requiſit for the Spirits, to wit, their ſedation and refreſhment, are granted (and almoſt only) to Animals in Sleep. For althô in Waking, pleaſant ſenſible Objects do ſomething pleaſe the Spirits, and that the nouriſhing Liquor, ſupplied from Aliments newly received in, may ſomething cheriſh them, yet a fuller refreſhment, and quieting, by which they are ſufficiently fortified, for the lively performing the Animal Functions, are not obtained but in Sleep; for then the Spirits being at leiſure for ſome time, from Motion, get to themſelves new ſtores; and in the mean time the Brain, like a dry Sponge, imbibing moſt greedily the nutritious Liquor, takes it for Proviſion for it ſelf; which after a little ſpace, it diſpenſes to the ſeveral Parts, both of its proper Regiment, and alſo of its Appendix; yea, plenty of the Spirits, and their food, being ſomewhat exhauſted, the Brain, as it were another Stomach, ſeems to be hungry after Sleep, greatly to deſire it, and not to be ſatisfied, unleſs it daily enjoys it, and that in its wonted meaſure: for in the ſpace of every Night, there is a certain Neceſſity of Sleeping for ſo many hours, as we have formerly accuſtomed our ſelves to; if at other times, as after Eating, an evil Cuſtom indulges Sleep, we afterwards more hardly want it, than our Dinner; for the privation of due Sleep, or what often accuſtomed to, is as it were a faſting to the Brain, by which, if long affected, that, and its Nervous Appendix, languiſh as it were for hunger.

To wit, a refection and quieting of the Spirits.

The formal Cauſe of Sleep, conſiſts in the Reſt of the Spirits, and in the watering of the containing Parts.

Therefore, for the taking of Sleep, by which the Brain may be filled, with the Nutricious Humor, and the Spirits, wearied or exhauſted by Motion, may be refreſhed, a certain Law of Nature, or Neceſſity is incumbent upon us, and calls it upon us oftentimes againſt our Minds: But this kind of Diſpoſition being innate to moſt Animals, and chiefly to Man, whoſe Spirits are moſt of all employed, is the Final or *Procatartick*, or more remote Cauſe of Sleep; but its formal or Conjunct Cauſe, conſiſts in theſe two things,

things, *viz.* in the Vacation or Reſt of the Spirits, and in the Irrigation or watering the Parts containing them; by which (as common to either Affection) a relaxation follows, from a Tenſity or Inflation of the Brain, and Nervous Parts.

The evident Cauſes.

As to the evident Cauſes or occaſions, by which Sleep is wont to be introduced, firſt we muſt diſtinguiſh concerning Sleep; That it is either Natural or Ordinary, which every one enjoys daily, for ſo many ſet hours, and its acceſſion and duration depends upon either Conjunct Cauſe exiſting together in Act, *viz.* at the ſame time, the Spirits remitting their tasks, ſink down, and the nouriſhing Humour flows into the Brain; then this being ſufficiently watered, and they refreſhed, Waking returns: Or Sleep is not Natural or Extraordinary, which for ſome occaſions follows in an undue meaſure, and inconvenient time. Concerning preternatural Sleep, we ſhall ſpeak more properly of it in another place; when we ſhall treat of Soporiferous or Sleepy Diſeaſes. But as to the Non-natural, we have obſerved; that it is of a double Kind, according to the Complication of the Conjunct Cauſe; For either the Spirits firſt lye down, and ſo the Brain imbibes more copiouſly the appoſite Liquor; or firſt the Brain is too much moiſtned with Humor, and ſo the Spirits being as it were drowned, are forced from their watches. For when the Blood every where waſhes the Cortex of the Brain, by almoſt innumerable Ramifications of Veſſels, a certain ſpirituous Water from theſe bloody Rivulets, always ſtands at the Door, and is ready to be inſtilled into the Medullar Subſtance of the Brain; which, for as much as it is copiouſly received within, preſently overwhelms the Spirits, and obſtructs their paſſages, and ſo Sleep being call'd upon, every Animal Function ceaſes for a time; yet, leſt this ſhould be too frequently and untimely done, the Animal Spirits, ſo long as they are lively and active, inflate the Subſtance of the Brain, and keep it extended, ſo that the Spirituous Liquor, which is alſo Soporiferous, is not admitted, but only in a ſmall quantity, ſuch as may ſuffice for the exciting of Sleep. But if either the Spirits being weary lye down of their own accord, or are compelled by the boyling Blood coming impetuouſly to the borders of the Brain, to give place to it, the aforeſaid Liquor, ruſhing in on heaps, produces almoſt invincible Sleep. Wherefore, according to which, either the Animal Spirits open the doors of the Brain of their own accord, or the Nervous Liquor beſieging them, impetuouſly breaks thorow; The *Prophaſes*, or evident Cauſes of Sleep, are of this or that rank: there are many Kindes of both of theſe, and ways of being done, the chief of which we ſhall briefly touch upon.

Sleep either Natural, or not Natural, or Preternatural.

Sleep not Natural, ſometimes begins, from the Spirits being brought low.

Sometimes from the Cortex of the Brain being too much watered.

For what Cauſes the Spirits lye down of their own accord.

The force of Cuſtom.

Firſt, In the firſt place therefore, there are many Cauſes, for which the Animal Spirits begin of their own accord to keep Holy-day, among which, the force or power of Cuſtom obtains the chief place. For when we have accuſtomed our ſelves to Sleep at certain ſet hours, the Spirits about the ſame time, as it were diſmiſſing the force of their Motion, leaving preſently all work, and External Commerce, retire inward, and indulge themſelves with Reſt: The reaſon of which is, becauſe the ſenſitive Soul, for as much as it is void of all Science, and proper direction, determinates this or that thing to be done, by outward Accidents and Circumſtances; wherefore, the Animal Spirits, in what path they are once led, unleſs they be hinder'd, will repeat to an hair their former tracts. Hence it is, that we both Sleep, and alſo Awake, at ſet and wonted hours, alſo we expect and hardly can paſs by, the ſame times of Dinner and Supper. So ſolemn the manner of Nature is to do the ſame thing which it did before, and till being taught new things, it is the manner of its Government, conſtantly and exactly to obſerve the old. An Example of this Kind of Natural aſſiduity is admirable, which was told me for certain, of a Fool living ſome years in our Neighborhood; who, tho he were ſilly and fooliſh, yet did he know exactly, without any ſign, the interſpaces of the Hours, and as often as the ſpace of an whole Hour was elapſed, as if he had been a living Clock, he would preſently perſonate the like Number of the Hour, with ſo many hoarſe ſounds, and no buſineſs or employ about any other occupation, could make him omit this Task. He at the beginning was wont to imitate aloud, by making a noiſe, every ſtroke of the ſounding Clock; and as often as he heard the ſounding of the Bell of the Clock, preſently he cry'd, *One*, *Two*, *Three*, &c. repeating ſucceſſively the ſeveral Pulſations; hence it hapned afterwards, that the Animal Spirits, by daily imitation, being accuſtomed to be ſtirred up, to ſuch a Motion, according to the ſet ſpaces of Time, at length they were able to diſtinguiſh the ſame Periods of their own accord, nothing directing, as if the ſliding ſpaces of time, had been meaſured out by the wheels of a Clock.

A notable Example of Natural Cuſtom or Aſſiduity.

Secondly, The Animal Spirits being wearied by the hard labour of the Body, or too ſerious intention of the Mind, indulge themſelves with Sleep of their own accord: For when after immoderate exerciſe, by reaſon of Heat and Sweat flowing forth, the Spirits plentifully exhale, and thoſe which are left being as it were poured forth and diſtracted one from another, as ſoon as thoſe have left them, they preſently lay aſide all work, that they may Concentre themſelves within, and recollect their forces; for the like

2. *The Spirits being weary, lye down on their own accord.*

like reaſon, after vehement ſtudy, or long Contention of the Mind, by reaſon that the Animal Spirits become very much tyred, we grow Sleepy; yea, ſometimes ſerious Meditation, and when imployed with Hearing (chiefly of Sacred things,) and great Attention, procures an invincible Sleep; the reaſon of which is, not that the Spirits are ſo much conſumed or wearied, but becauſe they are gathered together in two great heaps in the Brain; and ſo with them too great plenty of the Nervous Humor is poured in, whereby the Brain is overflowed: Hence alſo it is, that if preſently after Eating, Reading or Philoſophical Lectures be attended to, they ſhall cauſe Sleep ſooner than an Opiat; to wit, becauſe theſe more grave Exerciſes of the Mind, both convey more plentifully to the Head, the Blood; and at the ſame time the Spirits Concentre together on every ſide towards the middle Part of the Brain; wherefore, from the Blood coming to its border, a mighty heap of Nervous juice is admitted in; by which the Spirits are preſently overturned, and their ſpaces ſtuffed up; the contrary happens, as often as any one after a full Banquet ſhall go to the Theatres, to ſee Plays, for the Spirits being ſtretched forth by delectation, blow up and diſtend the Brain, ſo that the coming in of the Sleepy Humor, tho heaped up at the Door, is kept out.

The pleaſing of the Senſes, and the Phantaſie, cauſe Sleep.

Thirdly, We may obſerve, that the Animal Spirits, when delighted with a ſoft Harmony, are invited inwards from the Organs of the Senſes, and being there recreated, ſlide into Sleep. So a certain Muſical and ſoft modulation of the Voice, the gentle murmur of Waters, the ſoft whiſpering of the Wind, alſo pleaſant Fancies, as when we Imagine our ſelves to be in a green Meadow, or ſplendid Houſes, becauſe by this means, the Spirits gently Concentre together, Sleep is wont to creep upon one.

The Spirits are Compelled into Sleep, by Narcoticks.

Fourthly, There remains another manner of introducing Sleep, to wit, when the Animal Spirits are oppreſſed by *Narcoticks* or *Opiats* taken inwardly, or applied outwardly, and ſo are inhibited the exerciſe of their Function. For *Opiats*, becauſe they Poiſon the Spirits, extinguiſh their forces, as Water poured upon Fire, or Sulphur laid on the Kitchin Fire, and cauſe a *Torpor* or Numneſs; wherefore, if they are more largely taken, that they cannot be overcome by the Spirits put to flight, who by little and little being recollected, renew the *Syſtaſis* of the Soul, a deadly or perpetual Sleep follows.

Their Penury or want perſwades to Sleep.

Fifthly, To this rank ought to be referred the Penury or evil Conſtitution of the Animal Spirits; for when they are either deficient in Plenty, or are dull and Torpid, that they can neither tolerate daily or hard Exerciſes, nor actuate the Brain, nor defend it againſt the Inundations of the ſerous Humors, from thence are wont to be induced a Torpor or Numneſs, and frequent Sleepineſs of the Animal Faculty; as is to be obſerved in Dropſical and Scorbutical People: but the Conſideration of this Kind of Torpor, we ſhall refer to another place, where we ſpeak of Soporiferous Diſeaſes.

By what, and how many ways Sleep begins from the Brain, firſt affected.

2. Another Kind of evident Cauſes, by which Sleep is introduced, conſiſts in this, that the Brain is firſt affected; then by its Conſent, the Animal Spirits being half overthrown, betake themſelves to reſt; theſe Kind of Effects are chiefly brought in when an heap of Serum is poured in upon the Brain from the Blood too much ſtuffed with a watery Humor, which watering it with too much moiſture, ruſhes overs its Pores and Paſſages, and as it were drowns the Animal Spirits flowing in them. Such an Inundation of Spirits is produced, either from a too great taking in of Food, whence the Blood ſwelling up above meaſure, with the nouriſhing Humor, too much puts down upon the Brain the plentiful proviſion of Nervous Juyce; wherefore, preſently after a more full feeding or drinking, men become Sleepy; or alſo, the Blood, as to its Temper, being made more watery, moiſtens the Brain, as it were with a perpetual ſhower, and ſo renders thoſe affected continually Sleepy; as is wont to come to paſs ordinarily in Dropical and Scorbutical People. To theſe may be added, and oftentimes is partly the Cauſe, the imbecillity or weakneſs of the Brain, and the looſeneſs of its Pores, ſo that, they gaping too much, moſt eaſily admit the ſerous heap, whereby Sleepineſs is brought in. For it is obſerved, That Drunkards, eſpecially ſuch as drink Wine, fall aſleep with it, on the leaſt occaſion, and not only become Drunk, but alſo Drowſie or Sleepy. The reaſon of which is, that when the paſſages of the Brain, are more often and untimely unlocked, with the Particles of the Wine, at length become ſo feeble, that the Blood growing hot above meaſure, pours forth its Recrements upon the Brain, and ſo cauſes from thence a torpor or ſtupidneſs therein.

When its Compaſs is over-flow'd, by the Serum coming to it.

To which may be added, the imbecillity of the Brain, and looſeneſs of the Pores.

Sleep not from fumes or vapours.

Theſe are the chief means, whereby Sleep is effected, when it is excited, by reaſon of the overflowing of the Nervous juyce, and as it were the over-turning of the Animal Spirits. But as to theſe, it hath been far otherways taught, by the Opinion of the Vulgar, to wit, that fumes and vapors are raiſed up from the Chyle, or Humors growing hot within the *Viſcera* of Concoction, which cloud the Brain, and ſo cauſe a Numneſs. But this Opinion eaſily falls, ſince the Circulation of the Blood, and the more plentiful Suffuſion of it on the Brain, have been known; and that the rather, becauſe a paſſage

from

from the Stomach into the Head, thorow ſo many Inwards, and bony Cloyſters, like ſtops, ſeem impervious, or not paſſable for the ſending up of fumes. Without doubt, much the greateſt part of the Humor, with which the Brain is watered, and the Spirits inhabiting it, over-turned, during Sleep, is carried by the Arteries, and diſtilled in immediately from the Maſs of Blood. But althô we deny vapors elevated from the Stomach to the Head, to cauſe Sleep, yet by reaſon of ſome affections of the Ventricle, it manifeſtly appears, that Sleepineſs is induced; for as much as Opiats being taken, they begin to operate oftentimes preſently, and before the virtue or any of their Particles can come to the Brain, by the paſſage of the Blood. This alſo appears, becauſe we become Sleepy from more groſs Meats, and of ill Digeſtion, which ſtay long in the Stomach, and burthen it. The reaſon of which ſeems to be, becauſe, when as the Corporeal Soul, or a principle portion of it, is the immediate Subject of Sleep, and ſhe entertains it, for as much as being reſtrained from Expanſion, and as it were drawing a Curtain, ſhe enters into her ſelf, and ſinks down on every ſide, towards the middle of the Brain; we ſay, that ſuch a ſubſiding of the Soul, or its chiefeſt part, thô done in the Brain, is oftentimes excited, by reaſon of the Cauſe lying hid in the Stomach; becauſe there is a mighty Sympathy, between this and that; or rather, the Animal Spirits, inhabiting the Ventricle, althô ariſing from the Cerebel, conſpire ſo intimately with the deſiring or knowing Soul (which is the Inhabitant of the Brain) that they are able to bend, exalt, depreſs it every way. The Appetite of neceſſary or delicate food, ſnatches it from any other propoſition or deſire. The fruſtrated longing of big-belly'd Women, cauſes an Abortion, or a Monſtrous Birth. At the firſt taſte of a draught of Wine, before the Liquor can be carried into the Blood, it lifts up and wonderfully chears the drooping Soul. In like manner on the contrary, Opiats or Sleeping Medicines, becauſe they ſtupifie or mortifie the Animal Spirits, implanted in the Stomach, bring preſently a Torpor to the Knowing part of the Soul, and ſometimes an extinction to its whole *Hypoſtaſis*, both flamy and lucid: For the ſame reaſon, undigeſted Aliments, becauſe they fix and burthen the Spirits inhabiting the Ventricle, render the others Preſiding in the Brain, for ſome time Dull and Torpid.

The Matter of Sleep, conveyed only by the Arteries.

Why raw and indigeſted meats induce Sleepineſs.

That happens by reaſon of the Conſent, which is between the Stomach and the Brain, and which it has with the whole Soul beſides.

How Opiats Cauſe Sleep, whilſt they operate in the Ventricle.

But ſleep ſeems to begin not only from the Ventricle, but for the moſt part from the Eyes; for when about to Sleep of our own accord, we our ſelves firſt of all ſhut our Eyes, & our Eyes being made heavy, and dull, Sleep creeping upon us whether we will or no, love to be cloſed; yea, if we would watch longer, we rub our forehead, and Eye-lids, and open them with a certain force, as if about to caſt off Sleep chiefly there ariſing. Concerning theſe, we may ſay, that reſt, being about to be indulged to Animals, may be the leſs diſturbed, Divine Providence hath ſo provided, that the Windows being preſently ſhut, the meeting with External Objects may be hindred. The Eyes ought to perform this Office eſpecially, as the moſt noble Senſory; alſo that they may more certainly perform it; whil'ſt the Knowing Soul withdraws it ſelf, and Contract its Compaſs, the Spirits being recalled towards the middle of the Brain; the Sight, as the Organs of the other Senſes, are deſtitute, and left flaccid and apt to fall down; and this happens chiefly and more certainly to the Eyes, becauſe Sleep coming on, the Brain becoming full and ſwell'd with the flowing in of the Nervous juyce, at that time more uberous or plentifully abounding, very much preſſes upon the Optic Nerves, and thoſe moving the Eyes, lying under its baſis with a long paſſage, (different from any others) and ſo hinders the wonted inflowing of the Spirits into the Senſory of Sight.

How Sleep ſeems to begin in the Eyes.

Thus much for the Nature, Cauſes, and the various ways of inducing of Sleep; there yet remains for us to conſider of the chief Effects and Alterations of it, which it is wont to bring to Soul and Body, and their Parts and Humors, and firſt, what it brings to the Vital or Flamey part of the Soul, radicated in the Blood.

Of the Effects of Sleep.

1. Towards the Vital or Flamey part of the Soul.

Concerning this, firſt of all we ſhall note, That the Blood is more inkindled, and much more plentifully burns forth in Sleep, than in Waking: the Truth of this is plain, from the ſtanding Obſervations of ſuch as have given it for Law, that Men Sleeping, exhale or breath forth a departure of a far greater weight, than Men Waking, thô they uſe Exerciſe and Sweat. Moreover, Reaſon and Experience dictate the ſame thing, for as a Combuſtible Matter, being placed near the Centre of inkindling, and heaped about it, burns more than if the ſame being divided into parts, ſmoaking and half inkindled, ſhould be drawn out and planted here and there in various places; in like manner, it may be judged of the Blood, which being quiet in Sleep, being called aſide or diſturbed with no Paſſions, nor with the impulſes of the Muſcles out of the *Præcordia*, or detained out of doors, enters the Lungs with a more full Flood, and there more ſlowly paſſes thorow the Centre or place of accenſion; whence, there is a Neceſſity, that it ſhould then be more plentifully inkindled, and burn with a greater flame, than if touch'd only with a more light burning, it ſhould haſtily paſs thorow thoſe places. But every one doth know

The Blood is more inkindled, and inflamed in Sleep, than in Waking.

Wherefore thoſe that Sleep, are apt to be Cold outwardly.

by Experience in himſelf, that in Sleeping, the Præcordia grow very hot, and the External Parts are apt to be cold; wherefore, there is need of covering them with Bed-Cloaths, whereby the Effluvia, deteined about the Compaſs of the Body, might warm it, whil'ſt in the mean time there is a Burning in the Breaſt, and from the Flame and Soot aſcending from thence, the Tongue and Parts about the Mouth, as if roaſted, are white: Hence in the Day-time thoſe Sleeping in the open Air, or any where elſe, unleſs well defended with Cloaths, take Cold: for by reaſon of the Heat being drawn back, the Cold little Bodies of the Air compaſſing them, enter into the Pores, and ſtop them up; but on the other ſide, *Aſthmatical* People, and ſuch as have their Lungs ſtuffed or bound together, or are otherways difficult to be moved, hardly Sleep within the Bed, becauſe the ambient Heat ſo greatly increaſes the Flame, inkindled in the Præcordia, that for the eventilating it, and conveying it thorow the Arteries, the Lungs being weak, and growing tyred in the Motion, are ſcarce, nay, not at all ſufficient.

2. Sleep allays the diſorders of the Blood.

2. For as much as the Blood is more inkindled during Sleep, therefore then chiefly its diſorders are allayed. But theſe are of a twofold Kind: to wit, either the Blood is variouſly agitated hither and thither by the impulſes of the Conteining and Neighbouring Bodies, as in violent Paſſions, and Commotions both of the Body and of the Soul: Or it grows turgid, or ſwells up by its proper rage, after the manner of fermenting Wine, from the Heterogene, and heating Particles being mixed with it. As to the Firſt, ſo long as we are Waking, the Courſe of the Blood being very much diſturbed, is continually agitated as it were with certain winds: becauſe the Fantaſie, more ſtrong Meditation, the Appetite, and the ſeveral Paſſions, drive the Blood ſometimes more ſwiftly, ſometimes repreſs it by their Influence, ſnatch it impetuouſly ſometimes into theſe, ſometimes into thoſe Parts, and thence again repel it. Beſides theſe Floods, ſtirred up by the Mind, alſo the Motions of the Body and Members, render its Courſe yet more troubled and dangerous; becauſe the Sanguiferous Veſſels, being variouſly preſſed, by the Motive Parts, and by and by releaſed; they variouſly transfer, and call back the Blood, and by and by ſnatch it elſewhere; hence, its Humour, ſo long as it rapidly runs from place to place, evaporates leſs, and ſo heaps together a greater ſtock of Excrementitious Matter, which being ſuppreſſed within, ſtirs up Preternatural Heat, and renders the Flame of the Blood unequal, more ſmoaky, and troubled, yea ſharp and biting, and ſo troubleſom to the Heart and Brain, and alſo to ſeveral Viſcera, and ſometimes to the whole Nervous Kind, all which notwithſtanding Sleep allays; yea whil'ſt the Animal Spirits lye quiet, like allayed winds, the Sea of the Blood preſently becomes Calm.

Whither they are induced by the conteining Bodies.

The Internal boyling up of the Blood, is alſo allayed by Sleep.

Nor is the Blood, diſturbed by reaſon of its proper Effervеſcency, leſs quieted by Sleep: for when it grows hot from ſuch a Cauſe, it flames not forth with a clear and bright Flame, but fumes up with Smoak and Soot, and therefore being leſs eventilated, diffuſeth a very troubleſom and ſharp heat: which alſo is more infeſtous, becauſe the Recrements of the Blood, to wit, the Serum, and aduſt, and otherways viſcous Particles, being involved with its ſmoaking Latex, cannot be ſeparated and carried away. But in Sleep, the Blood is ſoon quieted, and paſſes more ſlowly thorow the place of inkindling, to wit, the Lungs; wherefore being there firſt more inkindled, it burns with a clearer Flame, and alſo more mildly, and ſo the ſmoak preſently ceaſing, and ſome Heterogenious Particles being burnt, all the reſt extricating themſelves from Confuſion, what are profitable are imployed in their deſigned Offices, and what are unprofitable, are bolted or ſifted forth, partly by Breathing, Tranſpiration, or Sweat, and partly thorow the other Emunctories.

The Blood performs its Offices, (which are the generation of the Animal Spirits, and the nouriſhing of the Parts) better in Sleep.

3. The Blood burning forth more clearly and plentifully in Sleep, at that time alſo performs better, yea chiefly, or almoſt only its Offices, the chief of which are, the Stilling forth of the Animal Spirits, and the Nutrition of the ſolid Parts. And firſt, it Prepares beſt of all Matter for both theſe, to wit, it well ſubdues, dreſſes, and ripens the Chyme, infuſed into its Maſs: then it inſtills the more pure and more ſubtil Part into the Shell of the Brain, from which, the veterane Spirits, during Sleep depart, for the end that a way may be open, for the Nervous or Spirituous Liquor to reſtore their Stores; and in the mean time, the other part of the Chyme, is conveyed every way by the Arteries, to the ſolid Parts, and whil'ſt they are quiet, it is beſt of all put upon them, and ſuffered to grow to them; otherwiſe, by their too great Motion and Agitation (as in Waking) it is apt to be ſhaken and wiped off.

Sleep is not to be yielded to, preſently after Eating.

But that Nutrition, and the Production of Animal Spirits may be rightly performed, in Sleep, it is not to be preſently indulged after Eating; for ſo the aforeſaid Offices are wont, not only to be hindred, but perverted into Evil: becauſe if any one Sleep with his Belly full, the Chyle as yet Crude, is ſnatched into the Blood: then before it can be there broken ſmall, and mixed with the Blood exactly, it is expoſed to a more full inkindling within the Lungs; that from thence the Lungs themſelves not rarely draw,

as

as from Juyces and Vapours there ſent forth, from the Crude inkindled Matter (as it were from green Wood) an Evil: which thing indeed is obſerved of many, falling into the *Phthiſis* or Conſumption of the Lungs. Thirdly, At length from the *Chyme* ſo evilly prepared, neither pure Spirits are diſpenſed to the Brain, nor laudible nouriſhment to the ſolid Parts; yea, that is obſcured and made dull by Fumes and Vapours, and theſe are diſpoſed into a *Cachexie* or *Atrophie*.

Such Sleep hurts the Lungs and Brain. Makes the Spirits more dull, and gives evil nouriſhment.

So much concerning the Effects and Alterations of Sleep, which indeed are wont to be more immediately impreſſed on the Flamey part of the Soul, rooted in the Blood, but mediately on the Parts of the Body depending upon it: Now let us ſee next, what this Paſſion brings to the other Part of the Soul, *viz.* the Lucid; and its Subjects, to wit, the Brain and Nervous Stock; Concerning theſe, we will ſhew what Sleep contributes to the diſpenſation of the Nervous Liquor, and to the generation of Spirits out of it, we ſhall alſo further Conſider, what ſort of influence it has on their Exerciſes and Government.

What Sleep affords to the lucid part of the Soul.

As to theſe, Firſt, It is to be noted, which we before-mentioned, to wit, that the Spirits of the Regiment of the Brain, the Executors of every Spontaneous Function, are employed only Waking; and that others ariſing from the Cerebel, both Waking and in Sleep: There is need for Sleep only for the former, whil'ſt they are well, that their Expences or conſumed Stores might be by it repaired: yea, and that the languiſhing or wearineſs of thoſe remaining might be refreſhed. This every one experiences in himſelf, and feels that there is no farther need of explaining it: But if the ſame Spirits, by ſome Morbifick Cauſe, being provoked, are moved into diſorder, that they become irregular about the Acts of Motions, or of the Senſes, whether Interior or Exterior, and ſtir up a Delirium, Convulſions, or Pains, Sleep, like a Charm, fully quiets theſe Spirits, how mad and deviliſh ſoever they be: wherefore if it comes not of it ſelf, in theſe Caſes it ought to be fetch'd with Opiats.

It refreſhes the wearied Spirits inhabiting the Brain.

And allays them, being out of order.

But as to the Spirits, the inhabitants of the Cerebel, becauſe, in Waking they are diſturbed by the buſineſs and tumult of the Spontaneous Functions, and being called away from their Labours are hindred; therefore, they perform their tasks better in the reſt and deep ſilence of the others: Hence the Concoction and the diſtribution of the Food, and the Separation of the Excrements, yea, and the *Oeconomy* of the whole Animal Function, is beſt performed by reaſon of Sleep: Hence, if at any time, too much Meat, or more groſs than is wont, being eaten, moleſts the Stomach, and inducing fulneſs, nauſeouſneſs, or bitter and acid belching to it, approaching Sleep, for the moſt Parts takes away theſe Evils, and facilitating the Concoction of the *Chyle*, clears it from its ſharpneſs, foulneſs, and bitterneſs. The reaſon of which is, becauſe the Animal Spirits, which actuating the Fibres of the Stomach, ſerve for Digeſtion, whil'ſt awake; being forced to bear its manner or guiſe towards the Brain, and its Parts, are diſtracted here and there, and are called away from their proper work, ſo that the Meat being as it were unfermented, and undigeſted, ſtays in the Ventricle. This every one plainly experiences in himſelf, if preſently he ſits down after feeding to Study, or ſerious Reading, for then the Brain being full and diſturbed, the ponderous and heavy *Chyle* in the Stomach, is deprived of Digeſtion: But in Sleep, the Spirits inhabiting the Ventricle, being freed from the Buſineſſes of the Brain, do beſt of all perform their task, and rightly digeſt and exalt by Fermentation, the *Chyle* in the Stomach, like an Elixir in a Furnace, with an equal and convenient heat. I might here enumerate other benefits of Sleep, for as much as it refreſhes the whole Faculties of the Soul, renews the vigour of the Intellect or Wit, ſharpens the Senſes, ſtops the tumults of Paſſions, recollects the forces of the Cogitations, as often as they are either wholly enervated, or diſtracted by immoderate Study, or long Waking, allays and quiets all things, and heals the weak Brain, and the languiſhments of its Parts, yea, and of all other Parts and Powers, by giving to them new forces or ſtrength, as it were Food to ſuch as want.

The Spirits inhabiting the Cerebel, are diſturbed, in Waking, with the Spirits of the other Regiment.

Why thoſe being diſturbed, do perform their Offices better, whil'ſt theſe lye quiet in Sleep.

Other benefits of Sleep are noted.

Hence Chyliſication, and other functions merely Natural, are performed beſt of all in Sleep.

The Nature, Cauſes, and Effects of Sleep, being unfolded after this manner, before we wholly leave its Conſideration, it will not be from the Matter, to ſubjoyn ſomething of Dreams, we ſhall here purpoſely paſs over what manner of Signification they have, both Natural, as they indicate the intemperance of the Brain, and alſo fatidical, as if they were inſpired by a *Dæmon*, and are affirmed to Propheſie things to come: we ſhall only inquire by what Motion, and agitation of the Animal Spirits, Dreams are produced in the Brain. We ſay therefore, that the Animal Spirits, although they affect naturally alternate times of Motion and Reſt, and whil'ſt they indulge Reſt, inſtilling freſh Nervous Humor to the Brain, they ſuffer themſelves to be bound together with Embraces, as it were with Chains, that they may not enter into Motion; yet it for the moſt part happens, that ſome Spirits eaſily caſt off this Bond, and love to wander hither and thither, in the deep ſilence of the Reſt. And indeed Dreams are only the Excurſions of

Of Dreams.

What they are.

ſome

ſome Spirits in the Brain, from their bond or tye, which, whil'ſt the reſt are ſtrictly bound together, wander about, without any Guide or Ruler; and repeat the types or ſhaddows of Motions, as it were Dances before learnt; and are wont to repreſent the Cogitations of things, though after a very confuſed manner. The Spirits which being got looſe, variouſly run about, whil'ſt the reſt are bound together, gain the Liberty of Motion, by a twofold means. To wit, ſome Spirits, fly from the Captivity of Sleep, for the moſt part, by reaſon of the Heat and Agitation of the Brain, as by Drinking of Wine, the fume of Tobacco, immoderate Exerciſe, as alſo by the Paſſions, and more hard ſtudy, is wont to ariſe: for by theſe means, the Spirits are ſtirred up, by a certain Stimulation or Provokement, and are driven as it were into rage, that, though Sleep creep upon them, all of them will not be bound or reſtrained, but that ſome of them will walk about the Sepulchers of the reſt, like Spectres in a Church-yard, and cauſe ſtupendious Apparitions of things. Another Exſuſcitation of ſome Spirits in the Brain, whereby Dreams are produced, is made by reaſon of ſome Spirits being diſturbed in other Parts, as in the Præcordia, Stomach, Spleen, Genitals, *&c.* By which, whil'ſt the ſame Perturbation is Communicated by the Nerves to the Brain, perhaps one or two Handfuls or Bands of Spirits, there ſtirred up, cauſes various Phantaſies to be repreſented. In the Diſeaſe called the *Incubus* or Night-Mare, when the Præcordia are ſtop'd in their Motion, or otherwiſe hindred, by reaſon of the Nerves being bound together, we Dream ſome Animal or heavy weight lying upon the Breaſt, ſtops our Breathing. The Genital Humor growing turgid or ſwelling up in the Veſſels, and irritating them, produces immodeſt Dreams. Undigeſted and groſs Meats, eaten at Supper, becauſe they aggravate or lye heavy in the Ventricle, and trouble it, render Sleep alſo troubled, and infeſted with terrible and affrightful Phantaſies; in like manner we might eaſily ſhew, that it is the ſame with many other Parts.

They are ſometimes excited by the Spirits inhabiting the Brain.

Sometimes by Spirits inhabiting other Parts, to wit, the Stomach, Spleen, Genitals.

Whil'ſt as it were private Troops of Spirits, being excited in the Brain, carrying themſelves hither and thither, exerciſe the Phantaſie, their Divergency or Excurſions happen ſometimes regularly, ſometimes inordinately: and therefore Dreams, repreſent either the Series of things before acted, or only *Chimera*'s, or Notions altogether incongruous and diſagreeing. Further, whil'ſt the Animal Spirits, being agitated by this means, within the Brain, produce Dreams or the Images of Cogitations, do often leap back, into the Nervous Stock, and there ſtirring up other Spirits, produce divers ſorts of local Motions: wherefore ſome Men alſo, when they Sleep ſoundly, are wont to riſe out of their Bed, to walk here and there, to remove the Houſhold-ſtuff from place to place, oftentimes to put on their Cloaths, to open the Doors, go up Stairs, and to paſs over Rocky places, which they could ſcarce go over when Awake; in the mean time if they meet with any Obſtacle in their Progreſs, they either adviſedly paſs by it, or remove it out of the way. I knew a certain Man, who was wont after this manner to walk a-Nights like a Spectre, and to ſpeak to others whom he met being Awake, would take them by the hand, and often-times ſtrike them, then, unleſs he being roughly handled did Awake; returning to his Bed, and after Awaking of his own accord, knew nothing at all of what he had done. Yea, it is obſerved of moſt of theſe Night-walkers like Spirits, that being awakned, they ſcarce remember any thing of what they did, or acted in their Sleep; as if they ſuffer'd ſomething that was different from other Dreamers; for theſe think that they perform local Motions, when indeed there is no ſuch thing, but the others move from place to place, and yet know nothing of it. In Dreamers, the Spirits being ſtirred up, ſpread or are carried wholly inwards, towards the Callous Body, and affect only the Imagination and Memory: but in thoſe walking in their Sleep, ſome handfuls or bands of them, being awakned, direct their tendency only outwards, towards the moving Parts, in the mean time, the Common Senſe, Imagination, and Memory are not at all affected. It is wonderful, what ordinarily happens to Witches, or Wiſe-women; to wit, they, whil'ſt they lye Buried in a profound Sleep imagine that they are in very far and remote places, and that they have ſeen the Spectacles of Seas and Lands, and things wholly unknown to them, and ſhall exactly deſcribe them; which without doubt is, becauſe the Devil brings the Idea's of theſe things before the Phantaſie, and ſo ſtrongly impreſſes them, that they for a certain believe, that they had been in them: On the contrary, Walkers in their Sleep, wander about the whole Houſe, and its Precincts, and truly perform divers Actions, of which, when they are Awake, they are wholly ignorant. If the reaſon of this Kind of Paſſion be inquired into, this firſt of all occurs; that thoſe ſo affected, freely exerciſe, at that time, the Faculties, both Senſitive and Locomotive; becauſe, they not only move their Feet and Arms, as it were in certain Meaſures and Numbers, as a Machine furniſhed with wheels and force is wont to do; but moreover, they hear with their Ears, ſee with their Eyes, and with a certain diſcretion vary their local Motions, according to the Impreſſions made

Dreams ſometimes ſtir up local Motions.

made from ſenſible things. Wherefore, from hence we may lawfully conclude, that ſome Animal Spirits, being ſtirred up inordinately, within the hinder Part of the middle of the Brain, perhaps about the ſtreaked Bodies, do ſtrike upon the little heads of the Nerves, and ſo raiſe up other Spirits, implanted by a long Series, within the nervous Paſſages, and the moving Parts, and drive them into Motions before accuſtomed to; hence the divers movings of the Body and Members, are produced. But, becauſe the tendency of the Spirits excited is made only outwards, and is not at all reflected inwards into the ſtreaked and Callous Bodies; therefore, for that the Common Senſory nor the Imagination are affected, they neither perceive nor remember the Actions they had done. If it ſhould be demanded, (for as much as the Common Senſe at this time is ſtupified or aſleep) by what inſtinct the Animal Spirits are determined, according to the Impreſſions of Senſible Things, for the performing of local Motions of this or that Kind; It may be ſaid, That this reciprocation of Senſe and Motion, depends chiefly upon Cuſtom, *viz.* The Spirits being before accuſtomed to be ordered after this or that manner, and having gotten the Liberty of Action in Sleep, compoſe themſelves of their own accord, for the performing of their wonted Meaſures; even as when an Harper, whil'ſt he is thinking of ſome other thing, his Fingers being before taught the Numbers of the Tune, exactly ſtrike the Strings, with wonderful agility and diſcretion.

Therefore, the Cauſe of walking in Sleep, ſeems to conſiſt in this, *viz.* That the Animal Spirits are too fierce and unquiet, and will not all lye down together, but that ſome of them, more fierce than the reſt, leap forth of their own accord, and enter into Motion, like as perhaps one or two Dogs, ſtarting out without government, leave the company of the reſt and fall to Hunting: For that Cauſe alſo, the Spirits ſo apt to wander and roam about for Excurſion, obtain their more free ſpaces in the Oblong Marrow, nigh the Nervous Original, rather than in the Brain or in its middle or marrowie Part. For it ſeems, that during Sleep, the Pores and Paſſages in the globous frame of the Brain, are ſtuffed up ſo, that the Spirits there, like to water frozen, are thruſt in hard together; in the mean time, the Subſtance within the Medullar Proceſſes of the Brain, and the Oblong Marrow, which lead towards the Nervous Original, is more looſe, and poſſeſſed leſs with an adventitious Humour; that the Spirits there being ready for Motion, eaſily make way for themſelves to go forth, and entring the little heads of the Nerves, produce local Motions, of which the Common Senſe, and the Superior Faculties of the Soul are utterly ignorant. For ſuch a Diſpoſition of the Brain and its Appendix, which inclines to wandring by Night, as if it depended upon a certain peculiar Conformation of the Organ, is proper to ſome Men from their Birth; nor does it indifferently happen to all Men, or is ever contracted by the reaſon of inordinate Living. I have known in a certain Family, where both the Father, and all his Children were obnoxious to this Affection, the Brothers would often run up and down in the Night, in their Sleep, ſometimes meet and lay hold upon one another, and ſo awake one another. But others, who had not this Evil impreſs'd upon them from their Birth, have fallen into this Diſtemper, without any fore-warning or manifeſt Occaſion.

Thus much concerning Sleep, and by the by of Dreams: we have largely handled thus the Nature of it, becauſe this Speculation very much Conduces to the illuſtrating the Affections of the Brain, and the Nervous Stock. It behoves us next, that we conſider of the *Aurora* of Sleep, to wit, Waking; but this may be conſidered under a twofold reſpect; either Firſt, for as much as it ſucceeds Sleep, it is its bound; or Secondly, according to its proper Eſſence. As to the former, we Awake, or Sleep is ſhaken off, either becauſe it ends of its own accord, or becauſe it is interrupted. That it may end of its own accord, two things are requiſite, to wit, that the Animal Spirits, being enough refreſhed, riſe up of their own accord, and return to their wonted watches; which indeed, they for the moſt part do, at a ſet-time, unleſs hinder'd: Secondly, That what ever is ſuperfluous of the ſerous Humor, by whoſe Embraces the Spirits are bound, be evaporated: for after Banquetting, or often Drinking, by which a greater plenty of the ſerous and ſpirituous *Latex* is carried to the Brain, we Sleep longer; ſo that there is need that Sleep be longer protracted, that it may ſuffice to ſpew forth the untamed Wine. But Reſt is very much interrupted by a violent Senſation; to wit, ſome Spirits dwelling about the Extremities of the Nerves, being awakned by the impulſe of ſome ſtrong object, awake others in the Common Senſory, whereby Senſation is performed, and then the ſtroke being further continued, all, being, as it were at a Sign given, called to Arms, awake ſuddenly, and fall to their watches. This kind of troubleſom Senſation, which awakes the Animal Spirits from Sleep, is not only brought in from an outward ſenſible thing, as when a great ſound, or ſtroke made on the Fleſh, ſhakes off Sleep; but ſometimes the Nervous Parts are pulled by a ſharp Humor, Phyſick, Worms, and other Internal Diſtempers, and ſo a Convulſion or Pain ariſing, the Spirits are compelled into Motion, and for that rea-

Of Waking. A double Conſideration of it. 1. As it follows upon Sleep. Waking is either Natural or Violent.

ſon,

ſon, we are excited from Sleep. As often as Sleep is broken off ſooner than it ought, often yawning, and reatching, for the moſt part follows: the reaſon of which is, becauſe the Spirits being awakned, ſtrive by contracting and extending thoſe Parts, to ſhake off the Dewie Humor, not ſufficiently evaporated from the Brain and Nervous Parts. Further, If we are forced to awake, before the Spirits are refreſhed with their wonted Proviſion, they from thence become dull and heavy, and leſs ready for the exerciſe of the Animal Function.

The Eſſence or formal Reaſon of Waking.

As to the Eſſence or formal Reaſon of Waking, it conſiſts in the liberty and expanſion of the Animal Spirits, in the Brain, and the whole Nervous Stock. For theſe, like ſtanding Souldiers, deſire to watch, both to meet the ſenſible Object, alſo by reaſon of their obedience towards the Superior Powers of the Soul, ſo long as they are fit for this work: But that the Animal Spirits may be able to perform their watches in a juſt time, and with their whole ſtrength it is required, that they ſhould be free without any Impediments; to wit, that they be not irritated with any groſs, or otherways Excrementitious Humor, nor drowned with a ſerous heap, but that being free from all burthen, they might remain ready, and ſtill nimble for the ſwifteſt Motions. Then Secondly, That the Spirits may rightly perform their watches, there is need, that they ſhould be only intangled in moderate Affairs. Being fitted by theſe Kind of defences, they lively accompliſh their Task, and daily for ſo many hours, continue their Motion, like the Wheels of a Clock, and then, the time being expired, they go to Reſt of their own accord.

The End of the Firſt Part.

THE SECOND PART PATHOLOGICAL: OR Of the DISEASES which belong to the Corporeal Soul and its Subjects, *viz.* The Brain and the Nervous Stock.

CHAP. I.

Of the Headach.

The Pain of the Head the chiefest and most common affection among Diseases.

THE pain of the Head is wont to be accounted the chiefeſt of the Diſeaſes of the Head, and as it were to lead the troops of the other Affections of that part; for that it is the moſt common and moſt frequent ſymptom, to which indeed there is none but is ſometimes obnoxious, ſo that it is become a Proverb, as a ſign of a more rare and admirable thing, *That his Head did never ake.*

The Cauſes of it manifold, and very diverſe, that they can hardly be methodically recited.

Hence it is, that its Cure is often inſtituted Empirically.

The Headach, though it be a moſt frequent Diſtemper, hath ſo various, uncertain, and often a contrary original, that it ſeems moſt difficult to deliver an exact *Theorie* of its appearance, containing the ſolutions of ſo manifold, and often oppoſite things. This Diſeaſe being conſtant to no temperament, conſtitution, or manner of living, nor to no kind of evident or adjoyning cauſes; ordinarily falls upon cold and hot, ſober and intemperate, the empty and the full bellied, the fat and the lean, the young and old, yea upon Men and Women of every age, ſtate, or condition. Hence, becauſe they cannot ſatisfie any one ſick with this Diſtemper, with the cauſes of it, moſt commonly they ſay, they all proceed from Vapours. Further, the Cure of this Diſeaſe is more happily inſtituted, not ſo much by certain Indications, as by trying various things, and at length, by collecting an Extempory method of Healing, from things helping and hurting. Wherefore, if I ſhould go about to untye this hard knot, by drawing forth the matter more deeply and more accurately, I muſt ask for pardon, if I am carried, by a long compaſs, thorow the various Series and Complication of Cauſes: and if at length, by any means, the *Ætiology* or the Reaſon of this Diſeaſe may be fully detected, a more certain way to its Cure may be opened.

What things belong to its Pathology.

Therefore, that we may go on more fully to inſtitute this *Pathology*, or ſhewing the Cauſes or *ſymptoms* of this Diſeaſe, we ought firſt of all to unfold the Subject, and the formal reaſon of this Diſeaſe, together with the Cauſes and differences; then to ſubjoyn the Curatory method, and to illuſtrate it with ſome more rare Caſes and Obſervations.

The Subject of this Diſeaſe.

As to the former, as all pain is a hurt or violated Action, or a troubleſome ſenſion or feeling, depending on a Convulſion, or a Corrugation of the Nerves, the Subject of the Headach are the moſt nervous parts of the Head, that is, the Nerves themſelves, as alſo the Fibres and Membranes, and ſuch as are more and moſt ſenſible, ſeated both without and within the skull. But the parts of this kind, which are affected with pain, are firſt the two *Meninges*, and their various proceſſes, the Coats of

the Nerves, the *Pericranium* (or skin compaſſing the skull) and other thin skinny Membranes, the fleſhy Panicle of the Muſcle, and laſtly the skin it ſelf. As to the Brain and Cerebel, and their Medullary dependences, we affirm, That theſe Bodies are free from pains, becauſe they want ſenſible Fibres, apt to be wrinkled and diſtended: the ſame, for the like reaſon, may be ſaid of the Skull.

The formal Reaſon of it.

2. But whenſoever pain is excited any where about the nervous parts of the Head, its formal reaſon conſiſts in this, That the Animal Spirits being drawn one from another, and put to flight, cauſe the containing Bodies to be pulled together and wrinkled, and ſo ſtir up a troubleſome ſenſion or feeling: But that which ſo diſtracts the Spirits, that from thence a troubleſome feeling ariſes, is ſome improportionate thing, ruſhing upon the Spirits themſelves, or on the Bodies containing them, which entring the Pores of, and ſpaces between, the Fibres, pulls them one from another, and ſo drives the ſpirits dwelling there into diſorder.

The differences and kinds.

Pain is either without, or within the Skull;

3. As to the differences of the Headach, the common diſtinction is, That the pain of the Head is either without the Skull, or within its cavity: The former is a more rare and a more gentle diſeaſe, becauſe the parts above the Skull are not ſo ſenſible as the interior *Meninges*; nor are they watered with ſo plentiful a flood of Blood, that by its ſudden and vehement incurſion, they may be eaſily diſtended, or inflamed above meaſure. Secondly, The other kind of Headach, to wit, within the Skull, is more frequent, and much more cruel, becauſe the Membranes, cloathing the Brain, are very ſenſible, and the Blood is poured upon them by a manifold paſſage, and by many and greater Arteries. Further, becauſe the Blood or its Serum, ſometimes paſſing thorow all the Arteries at once, both the *Carotides* and the *Vertebrals*, and ſometimes apart, thorow theſe or thoſe, on the one ſide or the oppoſite, bring hurt to the *Meninges*, hence the pain is cauſed that is interior; which is either univerſal, infeſting the whole Head or its greateſt part; or particular, which is limited to ſome private region; and ſometimes produces a Meagrim on the ſide, ſometimes in the forepart, and ſometimes in the hinder part of the Head.

Or univerſal, or particular.

This either before, behind, or on the ſide.

Many other differences of it noted;

There are many other differences of this Diſeaſe, to wit, That the Pain is either light or vehement, ſharp or dull, ſhort or of continuance, continual or intermitting; its approaches ſometimes periodical and exact, ſometimes wandring and uncertain. Alſo by reaſon of the Conjunct Cauſe, which (as ſhall be declared by and by) ſometimes is the Blood, ſometimes certain excrements of it, as either the Serum, or nouriſhing juice, or vapours, or wind; ſometimes it is the nervous liquor, ſometimes a congreſſion or ſtriving of it with the bloody liquor: The Headach may be called, either bloody, and that either ſimple, or elſe ſerous, vaporous, or otherways excrementitious; or elſe Convulſive, from the humor watering the nervous Fibres, and irritating them into painful Corrugations.

Of which the chiefeſt is, that it is either occaſional, or habitual.

Concerning theſe, that we may proceed methodically, we ſhall rehearſe in a certain order, the various kinds of this Diſeaſe, with their Cauſes; and it ſeems good, that we diſtinguiſh the Pain of the Head to be either accidental, or occaſional and habitual: The former is wont to be excited without any foregoing cauſe, or previous diſpoſition, by the ſolitary evident cauſe, as when an Headach happens almoſt to all men after the drinking of Wine, Surfetting, lying in the Sun, or vehement exerciſe, alſo in the fits of Feavours; to wit, foraſmuch as the Blood being incited, more than it was wont, and boiling up immoderately, very much blows up and diſtends the Membranes it paſſes thorow; yea the Serum and Vapors, copiouſly ſent forth, from it, then growing hot, and ruſhing on the Membranes, pull and provoke the nervous Fibres.

The reaſon of the former unfolded.

The habitual Pain of the Head hath always a more remote Cauſe, beſides the evident Cauſe.

Secondly, The habitual pain of the Head, hath ſome *procatartick* or more remote Cauſe fixed ſomewhere, by reaſon of which it is troubled, either conſtantly or often; ſo that though it ſometimes intermits, yet it often returns of its own accord, and is excited alſo upon every light occaſion: but this, whether it be continual or intermitting, hath neither always, nor only, the Suffuſions or too great Evaporations of the Blood or Serum, for the Conjunct Cauſe, (although theſe are often preſent, where notwithſtanding they are rather inſtead of the Evident Cauſe, than the Conjunct) but beſide, an evil *procatarxis*, or a certain prediſpoſition, is always affixed to the part affected, or wont to be diſtemper'd; by reaſon of which, the aforeſaid Cauſes, alſo the inordinations of the Nervous Liquor, and the meeting and growing hot of it with the bloody Serum, or the Nutritious Juice, raiſe up the fits of pains.

The evils, or the weak Conſtitution of the affected part, and the eaſie flowing in of the morbific matter, concur to this more remote cauſe.

The Parts of the Head prediſpoſed, and their vices, viz. an evil or weak conformation are noted.

Although the more remote Cauſe of the Headach be manifold and diverſe, ſo that its ſeveral kinds can ſcarcely be number'd, yet for the conſtituting it, theſe two, to wit, either one or both of them, do chiefly or for the moſt part lead the way, *viz.* Firſt, The evil or weak Conſtitution of the affected part. Secondly, Then, becauſe of the more eaſe and ready heaping up of the Morbific matter in it.

As

As to the former, the parts of the Head obnoxious to pains, are the Nervous Fibres, belonging to the Membranes, Tendons, the Muſculous fleſh, and other ſenſible Bodies; the Morbid proviſion of which conſiſts in their evil conformation or debility.

Of theſe, that the former is ſometimes innate and hereditary, appears from hence, becauſe the Diſeaſe is often delivered from the Parents to the Children: and ſeems to be done chiefly by this means: becauſe the covering of the Head being made more thick, or more cloſe than it ought, neither the humors, nor the vapours do eaſily paſs thorow; wherefore being by theſe reſtrained, and hindred in their Motion, and ſo heaped up, the *Meninges*, *Pericranium*, and other ſenſible parts, being too much ſtuffed, or inflated, or hauled, receive pains: to which happens, that ſometimes, by reaſon of the original intemperance of the Brain, the Humors or Vapours about the parts, hanging like an arch over it, are variouſly heaped up together. *The former oftentimes is innate and hereditary;*

2. But it more often comes to paſs, that the Vices of an evil Conformation, by which theſe or thoſe parts of the Head are diſpoſed to the Headach, are contracted anew, and that by a various kind of production: for ſometimes by Cold taken, by reaſon of the Northern winds, Snow, or Rain, the Pores of the skin in ſome region of the Head, yea and the nervous Fibres themſelves, are ſo cloſed up, or otherwiſe perverted or weakned, that they are not able to bear the outward air, nor the agitations of the Blood or Humors, but preſently the Headach ariſes. *But more often is contracted anew:* *And chiefly from Cold,*

Nor is the prediſpoſition of the Headach leſs rarely produced, in the diſorderly uſeing the ſix not natural things. For the Blood being ſtirred up above meaſure, upon any cauſe whatſoever, impreſſes by its boyling up, or by the inſinuation of the Serum or Vapours, a breaking of the unity in ſome nervous parts, or ſome other ſort of hurt; for which reaſon, as there is a preſent Headach, by and by ſtirred up, ſo afterwards there is a diſpoſition to the ſame, upon every light occaſion. But oftentimes a diſpoſition to the Headach not eaſily blotted out, is induced by a vehement Paſſion, Surfeit, Drunkenneſs, alſo by a blow, wound, or contuſion of the Head: ſo that either the proper or excrementitious humors being heaped up, and ſtanding in thoſe parts, being afterwards moved of themſelves, or growing hot with other inflowing juices, ſtir up inflations, or painful haulings or pullings. Yea, I have known Inflammations, Impoſthumes, Whelks, *Scirrhous* tumors growing to the *Meninges* with the Skull, and other Diſeaſes of an evil conformation, excited in the Membranes of the Brain; by which, at firſt for a long time, frequent Headaches, and moſt cruel, and then afterwards a ſleepy and deadly diſtemper hath been induced; the cauſe of the Diſeaſe not detected, but after death by *Anatomy*; and indeed it is to be ſuſpected, that inveterate and pertinacious pains in the Head, which return, and dayly become more tormentive, in ſpight of all Remedies, depend upon ſome ſuch invincible cauſe. *Alſo by reaſon of the inordinations in the ſix non naturals.* *By accident.* *From internal Concretions.*

2. Not only an evil conformation, or the breach of unity, but alſo ſometimes a meer weakneſs or enervation, renders ſome parts of the Head obnoxious to the Headach; for when as the Fibres are ſomewhere ſo infirm, that they are neither able of themſelves to rule the proper humor, nor to reſiſt the incurſions of a ſtrange humor; the part ſo diſpoſed, by reaſon of any light occaſion, is moved into painful wrinklings: Theſe kind of debilities of the Fibres, ſometimes external accidents, as the exceſs of cold or heat; ſometimes alſo errors in Dyet or living, as Surfeit, Drunkenneſs, and eſpecially ſleeping at noon; moreover great *Catarrhs*, and a long lodging of a ſharp Serum are wont to bring in. *2. The debility of the diſtemper'd part is alſo a more remote cauſe of the Headach;* *Which outward accidents and errours in feeding and other Diſtempers, are wont to produce.*

So much for the primary more remote cauſe of the Headach, which is alſo fixed and rooted: The other cauſe of it, ſecondary and moveable, conſiſts in a ready and eaſie heaping up of the Morbific matter about the prediſpoſed parts, from which come the fits of pains, and their approaches: But as the matter is manifold, it is wont to be heaped up after a diverſe manner, and to excite pains which affect after a diverſe ſort: This, as we have ſaid, is either the Blood, or its Serum, or the nouriſhing Juice, or the nervous Liquor. Every of theſe being variouſly diſpoſed, or imbued with feculences or dregs, are by degrees heaped up about the prediſpoſed parts of the Head, ſometimes before the fit; and ſometimes, that coming, they are plentifully caſt down. But ſometimes one only humour with its plenitude and acrimony, diſtends or provokes the ſenſible Fibres; ſometimes more meeting together, by their mutual growing hot, pull or haule the Fibres, and ſo ſtir up painful Convulſions. We ſhall briefly take notice of the ſeveral kinds of theſe, with their ſigns, and the manner of their being made. When therefore a part of the Head, as chiefly the *Meninges*, or ſome region of the *Pericranium*, is prediſpoſed, by reaſon of an evil conformation or debility, to the Headach; the approaches or fits of the Diſeaſe are wont to be excited, by reaſon *The other part of the more remote Cauſe, ſecondary and moveable, conſiſting in the flowing in of the morbific matter.* *This matter is either the Blood, or its ſerum, or the nutritious, or nervous Juice.* *Which ſometimes alone, ſometimes meeting together, irritate the prediſpoſed parts.*

ſon of the various incurſions or coming together of the following humors, ſometimes of this, ſometimes of that humor, and ſometimes of many together.

How the Blood excites the Headach.

1. Sometimes the Blood it ſelf being incited into a more rapid motion, and boiling up into the Head, is ſtraitned or ſtopp'd in its paſſage about the prediſpoſed places, and from thence, being by and by heaped up there, diſtends the Veſſels, greatly blows up the Membranes, and pulls the nervous Fibres one from another, and ſo brings to them painful corrugations or wrinklings. For this reaſon thoſe obnoxious to the Headach, are forced to ſhun all occaſions by which the Blood ſhould grow hot above meaſure, as drinking of Wine, Exerciſe, Baths, *&c.*

2 How the Serum.

2. The Serum being more copiouſly heaped up in the bloody Maſs, oftentimes conceives a ſudden Flux, either of its own accord through meer fulneſs, or ſtirred up by an evident cauſe, and ſo preſently running forth from the Blood doth not only ruſh into the Lungs, but very often into the Head, and being poured upon its Membranes or Muſcles, is copiouſly heaped up about the parts prediſpoſed to the Headach, and there induces painful Corrugations and Inflations. Further, the Serum carries with it infeſtous Recrements, as ſulphureous, ſaline, ſharp, acid, bilous, or melancholic, or of ſome other kind, and fixes them to the nervous Fibres, which cauſe an acute or dull, a ſhorter or a longer pain. The Headaches ariſing by reaſon of this kind of remote cauſe, infeſt more grievouſly in the Winter time, in a moiſt Air, and in a Southern Wind: Moreover, *Catarrhs* of the Face, Mouth, *Larynx*, and of other parts, oftentimes accompany this Diſeaſe.

3 How the nutritious Juice.

3. The nouriſhing Juice, or freſh *Chyme*, being carried from the Blood to the ſolid parts, and laid upon them, by reaſon it becomes improportionate to ſome parts of the Head evilly diſpoſed, is wont to excite periodical fits of the Headach. For this proviſion being laid up near ſome nervous Fibres, becauſe it cannot be aſſimilated, begins to trouble them or burthen them, after ſome ſtay, and at length provokes them into wrinklings to expulſe that which troubles them. An Headach proceeding from ſuch a cauſe, as I have obſerved in many, doth dayly come at ſo many hours after eating, and continues a like ſpace of time; yea the times alter according to the manner of taking their repaſt, both as to the quality and quantity, and ſo alſo the fits of the pains are wont to vary.

4 How the nervous Liquor is a cauſe of this Diſeaſe.

4. The nervous Liquor, is a cauſe of pains, by its inordination, as oftentimes in other parts, ſo alſo not ſeldom in the Head; for this either degenerating from its temper, or being imbued with dregs or filthineſs, does not paſs thorow ſo freely the nervous Fibers, but is apt to ſtagnate, and to be heaped up in them to an irritative fulneſs: and that chiefly within the Fibres made weak beforehand, or of an evil conformation (ſuch as are ſometimes the Membranes of the Head) becauſe in theſe prediſpoſed, the watering Liquor being hindred in Motion, eaſily ariſes to an aggravating or provoking fulneſs; ſo that the Fibres being ſo filled, like the ſtomach too much crammed, enter into Convulſions and painful wrinklings, for the putting away their contents, nor do they ceaſe from them, till they are freed of their burthen; which notwithſtanding, afterwards being heaped up again, ſometimes ſooner and ſometimes later, cauſe from thence others, and ſo again other fits of pains. The Headach ariſing from ſuch a cauſe, ſprings oftentimes without any notable turgeſcency of the Blood, and gently and as it were of its own accord, without any errors in dyet or living; yet ſometimes it may ſooner ariſe by reaſon of diſorders in the non-naturals, and other accidents: This is wont to come more often in the Morning, and after long ſleeping, when the nervous Fibres have drunk in this humor more largely.

The Headach ariſing from the fault of the nervous Liquor infeſts chiefly in the Morning.

5 How many humors meeting together, and mutually growing hot, ſtir up Headaches.

In the aforeſaid Headaches, the Morbifick matter is made up for the moſt part of one ſingular humor, and ſo the fits of the pains are ſomething more gentle, and oftentimes ſooner paſs over. But there is another Cauſe of this Diſeaſe, when two humors (like divers kinds of Salts) meet together, and grow mutually hot, and ſo from the ſtrife of diſſimilar particles, the Fibres are very much pulled, and moved into very acute and cutting pains, and are moſt commonly longer infeſted with them. In this caſe one of the champions is always the nervous liquor, but the other, either the ſerous water or the nouriſhing juice. We exempt the Blood, becauſe it only waſhes the paſſages of the Nerves, and does not enter them deeply; but the nervous humor, by reaſon of the vices but now recited, ſometimes of it ſelf, pulls the containing Fibres, and provokes them into painful Convulſions. If that another humor, either the Nutritious or Serous, (for both of them are wont to be guilty) being little of kin, be plentifully poured upon this ſo prediſpoſed, and copiouſly heaped up within the Fibres; preſently all the particles being raiſed up, ſtrive among themſelves, and ſo by a mutual effervency, notably diſtend and haule the Fibres, that from hence from their being long and greatly wrinkled, moſt ſharp and long remaining pains are induced. Whether it be

this

this or that humor, meeting with the nervous juice, that cauſes the Headach, may be eaſily known from the proper irregularities, above deſcribed, of either peccant humor by it ſelf.

The habitual Headach depends chiefly upon the fault of the nervous humor.

By what means, and for what more remote cauſes, the humors, either Nutritious or Serous, offend, as often as meeting with the Nervous humour, contained within the Fibres, move the fits of pains, ſhall be declared anon: in the mean time, I think it ſufficiently appears, that the more frequent and habitual Headaches are produced chiefly by the fault of the nervous liquor, becauſe this is moſt intimate both with the Fibres themſelves, which are wrinkled, and the Spirits which are moved into painful diſtractions; alſo becauſe the pains of the Head ſometimes ariſe without any diſorder or tumult of the Blood, Serum, or nouriſhing Juice, and theſe being emptied or allayed, after what manner ſoever, oftentimes the Headach moſt pertinaciouſly continues.

The fault of the nervous liquor is either univerſal, or particular, proper to the place diſtempered.

But concerning the nervous Liquor, when it is the cauſe of the Headach, we obſerve that its fault is ſometimes univerſal, and ſometimes private: for ſometimes it doth acquire its evil from the diſtempered part: to wit, foraſmuch as being conſtrained to ſubſiſt or ſtagnate within the Fibres, hurt by their conformation, it is ſo perverted that at length being infeſted, fermenting either by it ſelf, or with ſome other humor, it irritates them into painful Corrugations: Yet ſometimes, and eſpecially in the more grievous Headaches, we may ſuppoſe that the whole Maſs of the nervous Liquor is in fault, but the nervous parts of the Head partake of its evil, before any others in the whole Body; becauſe theſe are the chief and neareſt ſprings of the nervous Liquor, and are alſo highly ſenſible: wherefore, the nervous Liquor, when ever it is vicious, either ſwelling up of its own accord, or growing hot by another humour being poured unto it, within the *Meninges* and other Membranes of the Head, more than in the other parts of the Body, becomes painful. The thing appears to be ſo, becauſe a long and grievous Headach is wont to be Cured, not ſo much by Remedies applyed or proper for the Head, as by thoſe which reſtore the *Craſis* or Conſtitution of the nervous Juice, and the bloody Maſs; and ſuch are *Chalybeats*, or Steel Medicines, and *Antiſcorbuticks*, or Medicines againſt the Scurvy. Which certainly argues that the nervous Liquor, where-ever it is in fault thorow the whole Body, chiefly puniſhes the parts of the Head.

The more remote or evident Cauſes of the Headach are noted.

Thus much for the cauſes of the Headach, both the procatartick or foregoing, and the Conjunct: there yet remain others more remote, called Evident, which raiſe up the former, and provoke them into act, or the painful means of affecting. But they are of a various kind, and of a divers operation: to wit, Whatever things are apt, firſt, to transfer the Morbific matter from another place into the part affected; or ſecondly, to move it before lodging in it; or thirdly, and laſtly, which impreſs on the Fibres themſelves, prediſpoſed to painful Convulſions, this Diſtemper, by the conſent of the other parts afar off, they belong to this rank.

Of which ſort are, firſt, thoſe which move the morbific matter flowing from another place, to wit, either the Blood, or Serum, or nouriſhing juice, and ſtir it up within the places affected of the Head.

As to the former, the Blood and its inmate humors, to wit, the Serous and nutritious; alſo the bilous, acid, and otherwiſe vicious recrements, are apt to be moved from various Cauſes, and to be transferred into the Membranes of the Head, *viz.* many accidents from without ordinarily effect this, as great and ſudden mutations of the Air, or the ſeaſon of the year, exceſs of heat or cold, or of moiſture, plentiful feeding, drinking of Wine, Bathing, immoderate Venus, violent paſſions; yea many other occaſions ſufficiently known, and to be avoided by all ſubject to Headaches. Further, theſe humors ſometimes ſwell up of their own accord, and without any external Cauſe, or other ways evident, being moved, drive themſelves forward into the Head: in which place, when they come, and ſettle upon the Fibres before indiſpoſed, though they conſtitute a part of the Conjunct Cauſe, yet they, when they are firſt in motion or flux, become the means of the Evident Cauſe. Wherefore, when we have firſt unfolded, by what means the Blood, with its contents, being carried to the diſtempered Membranes, ſtir up Headaches; we ſhall then ſhew by what means, and upon what occaſions, the ſame humors are wont to be moved, and to be ſnatched into the Membranes.

The Blood and its contents, in Headaches are ſometimes the means of the Conjunct, ſometimes of the Evident Cauſe.

For what Cauſes the Blood is wont to be moved, and to bring hurt to the diſtempered Head.

And firſt the Blood growing hot of its own accord, and by reaſon of the ſtrife, and inteſtine motions of its particles, imparts its trouble to the Head: Its frequent and wandring turgency or boiling up, happens not only in the fits of Feavours, but alſo without any cauſe or ſuſpicion of diſeaſe, which in others ſcarce perceiveable, thoſe obnoxious to the Headach ſufficiently take notice of and feel; neither doth the blood only beſtow the hurt to the Head, from its own proper proviſion, but receiving it elſewhere, ſends it thither. Oftentimes the Blood receives the incongruous matter from the Stomach, Spleen, Meſentery, Liver, and other parts, or Inwards, infeſtous to it ſelf or nervous Stock; which growing hot a little time after,

that

The Blood delivers to the head the morbific matter received from any other part.

that it might extrude or thruſt it forth; it pours it upon the Membranes of the Head, and ſo produces the Headach, commonly called Sympathetick, *viz.* by a conſent excited in other parts; which kind of Diſtemper being tranſmitted from other parts to the Head, ſometimes alſo it happens after another manner, as ſhall be by and by declared.

A Flux of the Serum ſometimes from meer fullneſs.

When the Maſs of Blood abounds with Serum, it is ſometimes excited to the putting it off by meer fulneſs, wherefore it conceives a flux, or as it were a certain melting, to wit, by which the thin and watery part may be ſeparated from the thick and bloody. Then, becauſe the Blood becomes more diluted in its ſwelling up, and paſſes more ſwiftly and more copiouſly thorow the Arteries, than can be carried back by the Veins, almoſt all that is ſerous is ſent away by the ſpaces between the Veſſels, being poured ſometimes on thoſe parts, and ſometimes on thoſe, as falling down in many places, it cauſes tumors or Catharrs, ſo lying on the Membranes of the Head, it ſtirs up fits of pains.

Sometimes from other Cauſes.

But the ſerous heap, from many other cauſes ſweating forth from the Blood ſuffering a flux, ruſhes on the Meninges and the Pericranium, and cauſes in them moſt troubleſome Headaches. A ſudden Conſtipation or cloſing of the Pores by Cold or Wet, almoſt conſtantly produces ſuch a Diſtemper in moſt, obnoxious to this Diſeaſe. Sharp and thin Wines, Cyder, yea and Beer, that by reaſon of its ſoureneſs is apt to ferment, becauſe they fuſe the Blood, and precipitate its ſeroſities, are forbid to thoſe troubled with Headaches, as ſo much poyſon: And laſtly, whatever is wont to cauſe a Flux in thoſe troubled with the Gout, the ſame alſo for the like reaſon cauſes it in theſe, for the riſing Serum, in either, flows to the diſtemper'd part, where it oftentimes grows hot with the nervous humor.

Sometimes the watry humor ſuffering a flux offends the Head.

Further, not only the meer and ſimple Serum of the Blood, dropping forth upon the Membranes of the Head, ſtirs up pains, but ſometimes other humors joyning together, and by this paſſage being admitted to the diſtemper'd part, encreaſe the tragedy of the Diſeaſe; it often happens, that a thin and watery humor doth ſuddenly flow forth from the Lymphic Veſſels, the Glandula's, and perhaps from the Paſſages and Pores of the ſolid parts (in which it is gathered together) and is poured forth into the Blood in the Veins; from whence preſently paſſing thorow the boſom of the Heart, and being confuſed with the Arterious Blood, and by that ſoon ſeparated, is caſt back by any way it can find; therefore, being partly ſent away by the Reins, it cauſes a flowing down of a clear and copious Urine, alſo ſometimes partly redounding on the Brain or Nervous Originals, produces Sleepy or Convulſive Diſtempers, as we have elſewhere ſhown. Yea ſometimes, a certain part of the ſame limpid humor, being ſnatched with the Serum into the Membranes of the Head, raiſes up fits of a moſt cruel Headach: For indeed, I have obſerved in many, a watry and very plentiful Urine, either to precede or accompany the fits of this Diſeaſe.

Hence in thoſe that have the Headach, as in Convulſive Diſeaſis, there is often a clear and copious Urine.

The recrements of other parts, often carried violently to the head with the Serum.

But we may believe other manner of recrements, of the other parts, *viz.* bile from the Liver, black bilary feculencies from the Spleen, and perhaps incongruous humors from the Stomach, Reins, Pancrace, *&c.* are ſupped up by the Serum of the Blood, and deeply boiled with it, by which, whilſt it is infected, it more readily conceives Effervеſcencies, and ſo ruſhing impetuouſly into the Cephalick Veſſels, and there fermenting with the nervous Liquor, brings forth Convulſions, and painful and very troubleſome pullings or haulings.

The evacuation of the Serum thorow its right ways, being ſuppreſſed, brings its flux to the Head.

The ſerous heap, whether it be ſimple, or as we have ſhown, complicated, is ſufficiently infeſtous to the Head, whenever its uſual evacuation, thorow its due and accuſtomed ways, is hindred: *viz.* whether if the Pores being bound up, tranſpiration be inhibited, or by reaſon of the evil diſtemper of the Reins, an Evacuation by Urine is not copiouſly performed; either defect greatly puniſhes thoſe ſubject to Headaches. Further, the Membranes of the Head are oppreſſed, by reaſon of the paſſages of the Blood being obſtructed in other places: for if the lower or middle parts of the Belly, and eſpecially the Liver and Lungs, are troubled with an obſtruction, ſo that the Blood can ſcarce paſs thorow in thoſe places, its more full torrent is directed into other parts, and eſpecially towards the Head; ſo that for this Cauſe, I have known to have followed, not only Headaches, but alſo ſoporiferors or ſleepy, and ſometimes deadly diſtempers.

3. The nutritious juice ſometimes the cauſe of the Headach, either,

1. Becauſe it is carried with the Blood into the Head.

3. As the Serum in the boſom of the Blood, ſo the nouriſhing Juice, that is the freſh *Chyme* made out of the Aliments, lodges there too, and is circulated with it, and forced to follow its inexorbitances, being as it were in the current of the ſame River. Wherefore, when the Blood, preſently after eating, is carried impetuouſly or inordinately to the Head, and the nouriſhing Juice being half Concocted or depraved, is fixed there to the Membranaceous Fibres, it cauſes painful pullings or haulings to follow;

for

for hence it is, that exerciſe, bathing, violent paſſions, reading, or any ſerious intention of the Mind, upon a full ſtomach, hurt thoſe troubled with Headaches.

Sometimes the nutritious Juice is not preſently or eaſily mixed with the Blood, but being carried freſh to it, by and by ſtirs up a turgency, ſo that many, conſtantly after eating, are troubled with an high Colour, and oftentimes alſo with an Headach. This commonly, but amiſs, is imputed to the obſtruction of the Liver, when indeed it proceeds from an evil diſpoſition of the Blood, hardly bearing the mixture of the freſh Chyme. Wherefore, ſuch a diſtemper, follows for the moſt part dangerous Feavours, and eſpecially the Small Pox, and ſometimes great Surfeits.

2. Becauſe not being agreeable to the blood, it ſtirs up its effervescency.

4. There yet remains another ſort of Evident Cauſes, (to wit, by which the leading Cauſes, or prediſpoſitions to the Headach are actuated) plainly different from the former irregularities of the Blood, Serum, and nouriſhing juice; to wit, when Headaches very often moſt terrible, follow, by reaſon of Convulſions, begun in other parts, and from them continued to the Head. 'Tis an uſual thing for a certain ſenſe, or feeling, of a Formication, or little pricking, to creep forward from the *Hypochondria*, as alſo from the region of the Stomach, Meſentery, Womb, yea ſometimes from the Members or outward parts, to the Head, and by and by ſometime after to excite a pain that will laſt for a good while. This kind of Diſtemper, which is wont oftentimes to be the forerunner of the *Vertigo*, alſo of the *Epilepſie*, or the *Apoplexie*, is commonly believed to be the aſcent of Vapours; when indeed it is only a Convulſion, begun in the extremity of ſome Nerve, which creeping upward towards its original, and then coming to the Skull, for as much as it either is communicated to the parts within the Head, or to the *Meninges*, either one or both of them, it ſtirs up Convulſions or pains. Which paſſions notwithſtanding, follow this Formication or tingling, brought from elſewhere, ſometimes as a ſign, and ſometimes as the cauſe. We have in another place largely enough unfolded the reaſon of the former, to wit, it being ſhown, that when the Morbifick matter poſſeſſes the beginnings of the Nerves, or the neareſt parts to them in the Head, a Convulſion oftentimes beginning from the ends of the ſame Nerves, being carried thence upwards towards the places firſt diſtemper'd, aſcends as it were by a creeping forward: wherefore not only upon the Vertigo, but upon the Headach, a Vomiting comes very frequently.

Sometimes the evident cauſes of the Headach are Convulſions ſomewhere begun and continued by the paſſage of the nerves, into the Head.

Convulſions beginning afar off, are ſometimes ſigns of an Headach ſhortly to follow.

But further, an Irritation in ſome diſtant Member or Viſcera, is ſometimes the occaſion, and in a ſort the cauſe of the Headach; to wit, when the Morbifick matter is heaped up, even to a fulneſs of Turgency in the part of the Head already diſaffected, there is need only of a light Vellication or pulling of the Containing Fibres, that this matter being ſtirred, ſhould cauſe a fit of the Diſeaſe; to which movement, it often ſuffices, that by an intimate concent of ſome diſtant Inward, as the Ventricle, Spleen, or Womb, with the Head, the nervous Fibres ſhould be pulled or hauled; for preſently from thence, the trouble being communicated by the Nerves, ſome Membranaceous Fibres of the Head, being evilly diſpoſed, and burthened with the Morbific Matter, begin to be ſtrained and wrinkled, and ſo when the Mine of the Diſeaſe is moved from its moved Particles, the Fibres are urged into grievous and continual Corrugations.

Sometimes alſo the cauſe of it.

Headaches that ſeem to begin after this manner from the Viſcera, and commonly called Sympathetic, are wont to be aſcribed to Vapors, *viz.* by ſuppoſing a Mine of the noxious humor to lye hid in ſome Inward, from which being moved, whilſt the Effluvia aſcend into the Head, and there ſharply pierce thorow and pull the nervous Fibres, pains are excited. We have already ſo plainly refuted this doctrine, that there is no need here to bring any other reaſons to oppoſe it. But in the mean time, let us inquire whether pains of the Head do not ariſe alſo by other means, beſides a Convulſive communication thorow the Nerves, by reaſon of the Morbific Cauſe lodging in the Stomach, Spleen, and other places.

Convulſive Headaches ſeem to ariſe ſo from the Viſcera, not from Vapours.

Concerning this, we may ſuppoſe, that Matter oftentimes degenerate, is heaped up in remote parts, which carries its hurt to the Head, by the paſſage or Circulation of the Blood. 'Tis a uſual thing for Corrupt humors, *viz.* ſometimes ſharp, ſometimes acid or auſtere, to be heaped up in the Ventricle; Bile in the Liver, atrabilary or melancholic dregs about the Spleen, yea and other ſort of degenerate Matter about the Meſentery, Womb, or other parts: from which being heaped up to a fulneſs of ſwelling up, a Fermentative *Miaſm* or Infection is fixed to the Blood; from which, that, being as it were imbued with rage, impetuouſly grows hot, and partly by its ſwelling up, and partly by transferring what is incongruous into the Membranes of the Head, ſtirs up fierce and cruel fits of pains.

But this ſympathetick Diſtemper perhaps proceeds elſewhere, by reaſon of an evil ferment, communicated to the blood.

As to the Ventricle, that it is ſo, ſome obnoxious to this Diſeaſe have plain experience. Becauſe ſome of them, after the Bile or Choler flowing in the Stomach, and

So ſometimes it ſeems to be cauſed from the Ventricle.

and others after a noted ſoureneſs, and ravenous hunger, moſt certainly expect a fit of the Headach. The reaſon of which ſeems partly to be, that thoſe contents of the Ventricle being ſupped up by the Blood, make it hot, and ſtir up in the ſame a Cephalic Turgency or ſwelling up; moreover, from this kind of ſharp Vitriolick, or otherways infeſtous matter, being heaped up and moved within the Stomach, a Convulſion, or Corrugation very troubleſome, is impreſſed on the Fibres and the extremities of the Nerves there inſerted, which immediately being continued into the Head, by the paſſages of the ſame Nerves of the eighth pair, and of the Intercoſtal, is communicated to the Membranes, and the nervous Fibres, prediſpoſed to painful wrinklings.

The Head and the Stomach intimately conſpire, and mutually afflict one another.

By reaſon of the ſame Reciprocal Communication, between the Stomach and the Head, a nauſeouſneſs and Vomiting, as we ſaid but now, follows upon the Headach, *viz.* the Membranes being ſtirred up into painful wrinklings, by the Morbifick matter (even as is wont by a blow or wound) and transferring the evil by the paſſage of the Nerves to the Ventricle, guiltleſs of it ſelf, a vain endeavour of Vomiting ſometimes ariſes, nothing remaining within the Ventricle, that ſhould be caſt forth: yet ſometimes, from a cruel ſhaking of the Inwards, in ſtriving to Vomit, the Galliſh or Pancreatick humor, either one or both of them, being thruſt forth into the *Duodenum*, and caſt forth by Vomit, is ignorantly taken for the Cephalick matter.

2. How the Head-ach ſeems to ariſe from the Spleen.

2. The pains of the Head are wont to be imputed no leſs to the Spleen, than the Ventricle; and indeed 'tis ordinarily obſerved in Hypochondriacks, obnoxious alſo to this Diſeaſe, when a Pain, Inflation, a Rumbling, or ſome other Perturbation of the diſtemper'd Spleen, happens in the left-ſide, that the Headach, as if raiſed up by it, by and by frequently ſucceeds; hence, preſently 'tis the voice of the people, that theſe Vapours being ſent forth from the diſturbed Spleen, ſtir up the pain of the Head: But indeed, we may grant that the Headach ariſes ſometimes from the default of the Spleen, yet reject this opinion, that it ought for this cauſe to be imputed to Vapors, but indeed either to an evil Ferment, tranſmitted into the Blood from the Spleen, or from a Convulſion, from thence communicated to the Head, by the Nerves: becauſe in the Spleen evilly affected, the Melancholic humor being degenerate, ſometimes into a Vitriolic Nature, ſometimes a biting, ſometimes a ſharp, or otherways infeſtous, is oftentimes heaped up, which of its own accord being ſhaken forth, by reaſon of plenitude, or occaſionally by reaſon of ſome perturbation, and being confuſed with the Blood, impreſſes a Fermentation upon it, by which its Liquor ruſhing by it ſelf on the Membranes of the Head, or growing hot with the nervous Liquor, cauſes painful pullings or haulings. Further, it is no leſs probable, that ſometimes a Convulſion being excited in the nervous Fibres, which are very much diſpoſed about the Spleen, brought thence by the paſſages of the Nerves of the wandring and Intercoſtal pair, and continued to the Head, impreſſes the like Diſtemper to the Membranes prediſpoſed to it.

The like reaſon is for this Diſtaſt, ariſing from the Liver, Meſentery, or Womb.

3. A reaſon may be alſo rendred, according to the ſame *Pathology*, to wit, either from an evil Tranſmiſſion of the Ferment, or a continuation of the Convulſion, for Headaches which are ſaid to be raiſed up by conſent, from the Liver, Meſentery, the Womb, and other parts.

The kinds of habitual Headach are noted. It is either, Continual,

The habitual Headach, the *Ætiology*, or the Reaſon of which, we have already ſufficiently handled, is yet divided into certain kinds, to wit, it is either Continual, or Intermitting; but the periods of this are ſometimes determined to a certain time, and are ſometimes wandring and uncertain: we ſhall ſpeak briefly of each of theſe.

1. Sometimes therefore it happens, that ſome are afflicted with a Continual pain of the Head, to wit, for many days or months, little intermitting, unleſs when ſleep helps; in which caſe we ſuppoſe, that there is not only preſent a Procatartick or leading cauſe, but alſo a Conjunct, ſomewhere fixed and conſtant. For beſides that the parts affected, or that are wont to be affected, are weak, and their watering liquor much depraved, is apt to ſtagnate, or to grow hot with other humors; there is moreover oftentimes excited in them, a breaking of the unity, to wit, an Inflammation, a red and painful ſwelling, a Scirrhous tumor, or Impoſthum, or of ſome ſuch kind; about which, whilſt the humors of divers kinds do meet together, and are heaped up, there ariſe almoſt perpetual pains, by reaſon of the nervous Fibres being continually pulled or hauled. Theſe kinds of Headaches, do not rarely end in ſleepy diſtempers, and at length deadly; for when I have opened the Heads of many dead of theſe Diſeaſes, the ſigns or footſteps, declaring the aforeſaid kinds of Morbific cauſes, have appeared; ſome examples of theſe ſhall be added hereafter.

or Intermitting.

2. The habitual Headach, is for the moſt part Intermitting, whoſe fits, as they are certain and Periodical, or coming at a ſet period of time, are wont often to return in the ſpace of half a day and night, or once in twelve hours. Some more rare caſes I have known, which exactly repeating the Fits, came every other day, yea once in a week

week, or a month. It is an uſual thing, for Headaches, that ſeem to be driven away, to return again about the Equinoxes or Solſtices; to wit, becauſe at theſe times, the Blood and Humors conceive greater Turgences or riſings up, than are wont, and therefore are more apt to grow hot with the watering Liquor of the nervous parts of the Head, and to renew the wonted fits of pains. But when about theſe times of the year, Headaches return, they are not prorogued by a longer acceſſion for a great while, but for the moſt part, having gotten ſubordinate periods, they are wont to infeſt at ſome certain ſtanding hours, for the ſpace of twelve hours. *The Fits of the intermitting, either periodical, or certain;*

When therefore a Periodical Headach hath its daily fits; for the moſt part the reaſon of theſe, as of Intermitting Feavors, ought to be ſought from the fault of the Morbifick Matter, ariſing to a plenitude at a ſet time, and then growing hot. For it may be ſuppoſed, that the proper Liquor is perverted ſomewhere about the Membranes of the Head, and the nervous Fibres evilly diſpoſed, or doth not well paſs thorow them; wherefore, when the nouriſhing Juice, placed alſo on the ſame parts from the Blood, is not preſently aſſimilated, nor doth well agree with the other humor; at length, from both of them heaped up together and diſagreeing, a mutual growing hot ariſes, and from thence a painful pulling of the Fibres: but for that the fits of the pains, are not always at the ſame diſtance after Eating, but ariſe in ſome ſooner, and in others later, and ſometimes before ſleep, and ſometimes after; the cauſe is, that partly the offices of Concoction, and diſtribution of the Aliments, are performed ſometimes ſooner, ſometimes later; and partly, becauſe in theſe the nervous Liquor, and in thoſe the nutritious Juice, is moſt in fault: wherefore, as the fulneſs of this happens ſooner, and of that later, ſo the times of the fit vary: we ſhall illuſtrate theſe afterwards, with obſervations made concerning the caſes of ſick perſons.

3. When the fits of the intermitting Headach are wandring and uncertain, the *Procatarxis*, or foregoing cauſe of the Diſeaſe, is neither great nor conſtant, nor is the Evident Cauſe continual: Wherefore, when that either cauſe is oftentimes abſent, and one of them often wanting, the fits of the Diſeaſe are not tyed to certain times, but in ſome, they are as it were by chance and accidental, in others, in whom a prediſpoſition to this Diſtemper is a little more firmly rooted: the pains of the Head more frequently moleſt, and are ordinarily excited, by reaſon of various occaſions, yea and for ſome, they are wont to be moſt certainly expected. The reaſons of the fits ſo variouſly happening appear clearly above, from the *Ætiology* delivered of this Diſeaſe; beſides, the whole buſineſs ſhall be illuſtrated anon, by examples. *or incertain, and wandring.*

CHAP. II.

The Prognoſtick and Cure of the Headach.

SO much for the Cauſes of the Headach, which being ſo various and diverſe, and their Series ſo perplex'd and intricate, it will not ſeem eaſie to keep one Method concerning all caſes of the Sick, whereby we may be led preſently to the true knowledge and Cure of this Diſeaſe; nor is there leſs difficulty concerning its Prognoſtick: But common experience affords ſome obſervations, from which it may be gathered, that the Cure of this Sickneſs is ſometimes eaſie, ſometimes difficult, or ſcarce poſſible; ſo that from thence it may be lawful to declare the event of the Diſeaſe, either ſafe, or very dangerous, or wholely uncertain. *The prognoſtick of the Headach, ſhews it eaſie or difficult to be cured; alſo, the event of the Diſeaſe ſafe or dangerous.*

Truly, if any one enjoying formerly a perfect Health, ſhould fall into ſomething a cruel Headach, and of ſome long ſtanding, by reaſon of a more ſtrong Evident Cauſe, as drinking of Wine, Surfeit, Venus, immoderate Exerciſe, or ſuch like; forasmuch as the fore leading Morbid Cauſe is not as yet firmly laid, we may pronounce ſuch a Diſtemper to be ſafe enough, and not pertinacious *By what ſigns we may pronounce it ſafe, and eaſie to be cured.*

But if the Morbific diſpoſition ſhould be inveterate, ſo that for many years the fits repeat often of their own accord, and upon every light occaſion, this, though not dangerouſly ſick, yet we predict it not eaſie to be Cured. Further, the Cure will be yet more difficult, if Hypochondriack or Hyſterical Diſtempers, oftentimes troubleſome, are oft wont to excite the Headach at every turn, or if the taint of an inveterate Venereal Diſeaſe be rooted in any diſtemper'd part. *By what difficult.*

If that the pain of the Head ſhall be not only inveterate, but almoſt continual, that we might ſuſpect it to ariſe from an Inflammation, or a Scirrhous Tumour, an hot Swel- *By what ſcarce poſſible.*

ling, an Impoſthum, or Worms, there is none or very little hope of Cure; eſpecially becauſe the ſick will refuſe great remedies, as Salivation, or opening the Skull; which if they be made uſe of perhaps at any time with any fruit or ſucceſs, yet the former and this two for the moſt part are wont to be tedious to the ſick, before they can effect any thing worth the trouble and expectation.

By what, dangerous. The pain of the Head either Continual or Periodical, if it be great, and hath joyned with it a Vertigo, Vomitting, or other Convulſive or Soporiferous Diſtempers, ſhews a ſuſpicion of great danger: even which often paſſes into a deadly *Apoplexie*, and not ſeldom into an *Epilepſie*, Palſie, Blindneſs, Deafneſs, and other funeſtous and incurable Diſeaſes.

The Curatory method of the Headach comprehends many Indications, and thoſe of a various kind, according to the manifold Species, Cauſes, and differences of this Diſeaſe, which will not be an eaſie thing here to ſet down, and rehearſe in order.

Accidental Headach eaſily cured. The accidental Pain of the Head, with the remote Evident Cauſe, and its conſequences, ceaſes for the moſt part of its own accord, or at leaſt is taken away by letting of Blood, Reſt, and Sweat.

The habitual affords more indications. The habitual Pain, by reaſon of the diverſity of Cauſes, *viz.* both the *Procatartick*, and alſo the Conjunct, ſuggeſts alſo different intentions of Healing; we ſhall here briefly touch upon the chief of theſe, and to which all the reſt may be placed.

Two chief ſcopes of Cure. In every habitual Headach, whether Continual or Intermitting, there are two chief ſcopes or intentions of Cure to be met with; to which all the other Curatory intentions ought to be aimed, and by which we ſhould provide againſt either Cauſe of the Morbid *Procatarxis*.

1. To cut in two the Bed or Root of the Diſeaſe. 1. To wit, in the firſt place, that all the Tinder or inkindling of the Diſeaſe be cut off, you muſt endeavour, that both the matter flowing to the diſtempered places of the Head, or thoſe evilly diſpoſed, or apt from thence to flow to them, be ſuppreſt, or called from thence to another place; then moreover, that Convulſions in other places excited, and that are wont to be propagated from thence into the Head, be prevented.

2. To root out the Conjunct Cauſe. 2. Then ſecondly, it muſt be indeavoured (if it may be done) that the Diſeaſe it ſelf, or its Conjunct Cauſe may be rooted out, that the places of the Head prediſpoſed to Headaches, (whether they be only enfeebled or hurt in their Conformation) whilſt they are defended from the frequent Excurſions of the infeſtous matter, may recover their former ſtate and vigour. Which kind of Indication, though it be very ſeldom ſuddenly or wholely performed, yet ſometimes the Cure is by degrees laboured out, by diligence and care, however fixed and rooted the Morbid matter be.

The Neſt or Tinder of the Diſeaſe, the blood, ſerum, nouriſhing juice, nervous Liquor, and the Recrements carried thorow the Blood. As to what appertains to the firſt ſcope of healing, which is firſt and eſpecially to be regarded; we ſaid, that the Matter or Humours, which are wont to be gathered together about the parts of the Head prediſpoſed to the Headach, and to excite the fits of the Diſeaſe, are either the Blood or the Serum, or the nouriſhing or nervous Juice, or Liquor. Moreover, with every one of theſe Vapours and Effluvia's, as alſo Recrements, ſometimes Bilous, ſometimes Melancholic, ſometimes Acid, Salt, Sulphureous, and of ſome others of a various kind, taken into the Blood, from the Viſcera, ſometimes from thoſe, and ſometimes from theſe, we have ſhewed to be transferred by its paſſages into the Head: againſt the force and incurſion of all theſe, Medicinal fortifications are to be inſtituted.

How the inordinations of the Blood may be taken away and prevented. 1. And in the firſt place, if the leading cauſe to pains, or a diſpoſition thereto, lye about the Membranes of the Head, for that the Blood being hot, and apt to riſe up, ruſhes by heaps into the Membranes of the Head, and when it cannot eaſily paſs thorow them, diſtending the Veſſels above meaſure, and pulling the nervous Fibres, excites the fits of this Diſeaſe (whoſe ſigns are a Sanguine temperament, heat, and a flushing or redneſs about the head and face, alſo an high pulſe, and ſhaking, with veins diſtended with Blood) preſently it muſt be endeavoured, both that the Blood be made more ſedate, that it may not be ſo readily moved into rage or ſwelling up; as alſo that it be not incited, and boiling up may not be carried with a greater tendency or inclination into the Head, than into other parts, nor in like manner be compelled to ſtagnate, by reaſon of the boſomes of the *Meninges* being too full. Wherefore, if the fit infeſts long, let blood in the Arm, or the Jugular Vein: out of the fit, ſometimes it is expedient to take Blood from the Sedal Veins, with Leeches; to wit, by this means, that the Blood by chance boiling up, may be brought down towards that place, to which it often tends of its own accord. Let there be Medicines of Vinegar, Roſecakes, and Nutmeg, or ſome other *Epithems* or Medicines of the ſame nature applyed to the Head: Alſo give to drink *Juleps*, *Emulſions*, or *Decoctions*, which allay the fervour or madneſs of the Blood. Let the Belly be cooled and kept ſoluble by the uſe of Clyſters.

Clyſters. Moreover, for prevention, uſe at times Whey, or Spaw-waters; alſo drinking of Water, a thin and a cooling diet help; the ſhunning of Wine, ſpiced Meats, Baths, Venus, violent motions of the mind or body, yea and of all hot things is to be ordered. Then for the fixing of the Blood, its Effervescencies or growing hot muſt be prevented, for which, Diſtilled Waters, Juices of Herbs, or Decoctions, Electuaries, Powders, and eſpecially *Cryſtal Mineral*, are in frequent uſe. There is no need here to add a method or particular forms of Medicines, when in this caſe, almoſt every body labouring, is wont to be his own Phyſician, being taught by frequent experience, from things hurting or helping.

The pain of the Head from the ſerous heap, how to be cured.

2. It is rarely, that the Blood alone or only by it ſelf is in the fault; more often other humors, being carried by its paſſage to the Head, and there diſpoſed, cauſe the hurt: Therefore, when ever the Serous Colluvies, or heap, goes out from the Blood (as was ſhown but now) it cauſes Headaches frequently, (the ſigns of which are *Catarrhs* about other parts, *viz.* the Noſe, Mouth, or Throat, being infeſted with them) then abſtinency and reſt is to be ordered, and that the belly be emptied by a Clyſter, for the allaying the flux of the Serum, and that the matter be ſuffered to evaporate from the Membranes of the Head; if theſe do not ſucceed, and that the Headach ceaſes not quickly, and of its own accord, oftentimes in a more hot Conſtitution, Phlebotomy is convenient; to wit, becauſe the Veſſels being emptied of Blood, ſup up the extravaſated Serum: But in frigid tempers, Veſicatories or Bliſters are of notable uſe, applied to the hinder-part of the Head, or nigh the Ears. Then after the Belly is emptied by a Clyſter, the Flux may be allayed, by the uſe of *Anodynes*, or more gentle opiats: that being allayed it may be convenient to exhibit a gentle Purge, then Medicines, which either move by Urine or Sweat, or by both together, that ſo they may gently evacuate the ſuperfluous Seroſities.

Phlebotomy.

Purges.

Medicines fit for this purpoſe may be every where found in Books: which notwithſtanding are not to be made uſe of by *Empericks* raſhly, and without diſtinction; but ought to be deſigned according to the judgment and skill of a prudent Phyſician, always having a reſpect to the Conſtitution, the temperament, and proper diſpoſition of the Patient, and to other accidents and circumſtances, and to be compounded or altered according as the matter requires; yea ſometimes to be preſcribed extempore. Wherefore, ſince it will be altogether needleſs, here to heap up many Receipts, and a great pile of Medicines, it ſhall be ſufficient to propoſe in this place, one or two forms only, of every ſort of Medicines, reſpecting the chief intentions.

Pills.

Take *Pills of Amber half a dram, Reſine of Jalap four grains, of Peruvian Balſam what will ſuffice to make four Pills, let three be taken when the Patient goes to ſleep, and the other in the morning, if they work not enough.*

Purging Powders.

Or Take *of ſulphurated Scammony half a ſcruple, of the Ceruſe of Antimony fifteen grains, of the Cream of Tartar eight grains; make a Powder, to be taken in a ſpoonful of Grewel, early in the morning.*

An emetick Powder.

Take *of the Sulphur of Antimony four grains, of the Reſine of Jalap five grains, of the Cream of Tartar ſix grains, bruiſe them together, and with what will ſuffice of the Conſerve of Violets, make a Bolus, to be taken early in the morning with care, or by government.*

An Apozem.

Take *of the Roots of Butchers-Broom, Burdocks, Cherefoil, Avens, each one ounce; of preſerv'd Eryngo an ounce and an half, of the Florentine Iris three drams, of the leſſer Galangal a dram and an half, of the Seeds of Burdock three drams, of the dryed leaves of Betony, Sage, Vervine, female Betony, each half an handful; of Raiſins of the Sun ſtoned two ounces; boil theſe in four pints of fair water, till a third part be conſumed, then add to it of white Wine half a pound, ſtrain it, and ſweeten it (if need be) with ſyrup of the Five Roots two ounces; take of this ſix ounces warm, twice or thrice in a day, a good while after meals.*

A decoction of Woods.

For ſuch as are indued with a more Cold and Phlegmatick Conſtitution, the like Decoction of the Wood of Guaicum, Saſafras, Sarſaparilla, with the addition of the aforeſaid Ingredients, make an Apozem, of which take ſix or eight Ounces, twice or thrice in a day warm.

A Cephalick Decoction impregnated with the Tincture of Coffee.

For the poor, and oftentimes with good ſucceſs for the rich, I was wont to preſcribe a Decoction of the dry'd leaves ſometimes of Sage or Betony, Vervine, or Roſemary, made of Spring-water, and impregnated with the tincture of the Powder of the Berries of Coffee, taken warm twice a day, about ſix or eight Ounces.

The Headach from other humours mixt with the ſerum, how to be cured.

3. If that with the running out Serum, Saline, Acid, Bilous, or otherways Infeſtous particles, received either wholely from the Maſs of Blood, or by its means from the

the Viſcera, are carried into the Membranes of the Head, and being there fixed, bring forth great, acute, and continual pains, then it will be convenient to iterate ſparingly, the taking away of Blood, yea and ſometime a gentle Purge, to apply cooling Medicines, *Anodynes*, and ſweetners to the diſtemper'd places; ſo oftentimes alſo to exhibite more gentle *Hypnoticks*, or Medicines cauſing ſleep, at every turn; alſo *Apozems*, and the Juices of Herbs preſſed forth, which allay the fervour of Choler, carry it forth gently by Stool or Urine, and are of known uſe: but in the mean time more ſharp Medicines, or the more ſtrong, whether they be purgative, working by Sweat or Urine, helping it, for that they too much fuſe and ſhake the Blood and Humors, are carefully to be ſhunned. I have frequently obſerved in thoſe labouring with an acute and pertinacious pain in the Head, the Serum ſwimming in the Blood being let forth, to be dyed with a yellowneſs, or Bilous Recrements being boiled in it; alſo in this caſe, let Phlebotomy be ſparingly but often celebrated, and the drinking Whey, or Spaw-waters plentifully, have helped before any thing elſe.

The Headach ariſing from any Inward, how to be cured.

4. Further, by the fault of any Inward, as the Stomach, Liver, Spleen, or Womb, or of any other (by reaſon of the tranſmiſſion of an evil Ferment) the parts of the Head ſuffer, then in the Cure of the Diſeaſe, Remedies for the Spleen are to be given, with *Cephalicks*, or ſuch as are proper to the Head: Hence the Stomach being alſo in the fault, theſe often times are helpful to ſuch as are troubled with Headaches, *Elixir Proprietatis*, the *Elixir* of *Vitriol* of *Mynſich*, the ſacred Tincture, *Vitriol* of Steel, the Powder of *Aron* Compound, and others ordinarily had for the Stomach; for others whoſe heads partake of the evils of the Spleen, *Chalybeats*, or Medicines made of Steel often yield help. Some Women troubled with Headaches have felt eaſe from *Hyſterical* Remedies. In like manner, when the vices of other parts contribute to the Headach, let there be joyned with the former ſhown you, things to be taken for thoſe parts.

Rais'd up from the fault of the nouriſhing Juice, how to be handled.

5. Sometimes the nouriſhing Juice (as we ſhowed already) is the cauſe of the periodical Headach, *viz.* foraſmuch as this being poured on the Blood, and not rightly aſſimilated, by reaſon of diſagreeing particles, cauſes a ſwelling up in it, ſo that the Blood boiling up into the Head, carries its leavings or ſuperfluities into the *Meninges*, or into ſome of their prediſpoſed parts, and by this means ſtir up the Fibres into painful Convulſions. I have known many for this cauſe, to have been obnoxious to dayly Headaches, whoſe Maſs of Blood hath been vitiated after the Small Pox, Meaſels, and other Feavours, and ſickneſſes: *viz.* ſo many hours after eating, ſometimes ſooner and ſometimes later, firſt a fluſhing of redneſs in the Face, then a fullneſs in the Head, and a pain would infeſt them, and eſpecially after drinking of Wine, or eating of Meats apt to ſwell up, they would be more vexed. The coming of the Diſeaſe is wont to keep its diſtance, according as Meats are taken more or leſs, as the *Chyme* begins to ſwell up, either a little after its firſt entring into the Blood, or after a little ſtay in it.

Frequently follows the Small Pox and Meaſles.

Eaſily cured.

This Diſtemper is free from danger, and for the moſt part is eaſily enough Cured. After a proviſion of the whole, a gentle Purge, and ſometimes Blood-letting being ordered, Remedies profit moſt which reſtore the Complexion of the Blood, ſuch chiefly are *Antiſcorbuticks* and *Chalybeates*.

An Electuary.

Take *of the Conſerve of Fumitory, of Tanſie, and Wood-Sorrel, each two ounces; of the Powder of Aron Compound three drams, of Ivory, Crabs-Eyes, Coral prepared, each one dram; Powder of yellow Saunders, and Lignum Aloes, each half a dram; of the Vitriol of Steel one dram, of the Salt of Wormwood a dram and a half, of the Syrup of the Five Roots what will ſuffice to make an Electuary. Take of it in the morning, and at five a clock in the afternoon the quantity of a Cheſnut, drinking after it three ounces of the following liquor.*

A Julep.

Take *of the water of the leaves of Aron, of Vervine, of Elderflowers, each ſix ounces; of the Water of Snails, and the Magiſterial of Earth-worms, each two ounces; of Sugar one ounce: Mingle them.*

Antiſcorbutick Remedies good for it.

Hither may be brought various Remedies, that are wont to be made uſe of againſt the Scorbutick Dyſcraſie, or evil diſpoſition of the Blood, and may be given with good ſucceſs: For Headaches, which are ſo familiar in the Scurvy, oftentimes proceed from the vice of the Blood perverting the nutritious Humor, and carrying its Recrements to the Membranes of the Head: Wherefore Remedies againſt that Diſtemper, in another place noted by me, may be uſed here.

The Headach raiſed up from the vice of the

6. There yet remains another humor, to wit, the nervous Liquor, which being heaped up within the Fibres of the Meninges, and of other parts of the Head, ſometimes

times becomes improportionate, by its proper incongruity, to the Fibres, becauſe ſharp or otherways degenerate, ſometimes pulls the containing parts, and provokes them into painful Convulſions, or Diſtentions, becauſe it grows hot with ſome other Humor flowing thither, to wit, the Nutritious or the Serous. *nervous humour, how to be cured.*

The Nervous Humor, when it is ſo Morbific or faulty in its whole Maſs, carries its evil to the prediſpoſed Head, or if of it ſelf innocent, is perverted within the diſtemper'd Fibres, and ſo ſecondarily becomes Morbific or Diſeaſed; then the Cure of it depends upon the reſtitution of the containing parts; to wit, if the Debilities, or the hurt Conformation of the Fibres may be mended, preſently the Humor watering them will be free from fault. We ſhall tell you by and by, by what Remedies the vices of the parts prediſpoſed to Headaches may be taken away. *Its fault either private or particular,*

In the mean time, if the nervous humor, being degenerate in the whole Maſs, imparts its evil to the Head prepared for pain, thoſe kind of Medicines, and method are to be made uſe of, by which it being reduced to its due Conſtitution, paſſing thorow thoſe Fibres, it little or nothing provokes them. For which end, neither letting of Blood, nor yet ſtrong Purges are at all convenient, becauſe thoſe things which ſhake the Blood and Humors, and leſſen ſtrength, impreſs by that means a greater ſharpneſs and rage to the faulty Nerve. But gentle Solutives, and a ſparing taking of Blood, ſometimes may be uſeful, whereby the Inwards may be cleanſed, and the bloody Maſs ſomewhat purged, and a way made for other Medicines, that may better ſucceed. *Or univerſal; and then letting of blood, or ſtronger Purges, are not convenient.*

But Medicines, which render the nervous Liquor more friendly and benigne to the Membranes of the Head, that are wont to be troubled by it, are of that ſort commonly called *Cephalicks*, whoſe particles being active, thin, and ſubtil, paſs thorow the Blood without trouble or tumult; then inſinuating themſelves with the nervous Liquor, gently move it, and ſo cauſe the nervous paſſages to be unfolded, ſo that the Animal Spirits, more freely beam forth thorow all the Bodies, both ſenſible and motive, and inſpire them without any leſſening, Convulſions, or irregular diſtentions. *Remedies called Cephalicks proper here.* *Of which ſort are theſe,*

Theſe kind of Remedies, although they are not always effectual, yet they oftentimes take away ſome Headaches not much inveterate, and in ſome, help ſometimes how pertinacious ſoever they be. Further, the ſame which are preſcribed with good ſucceſs for the pains of the Head, are alſo for the diſtempers of the Brain and Nervous Stock; and ſo on the contrary, what are uſed for theſe, alſo for thoſe; to wit, the virtues of thoſe being unfolded within the Head, againſt the Apoplexy, Palſie, Lethargy, and other Diſeaſes a-kin to them, help alſo within the moving Fibres, againſt Convulſions and Convulſive Motions; beſides, putting forth their virtues within the ſenſible Fibres, they often give help to pains. *which are convenient in Diſeaſes of the Brain, and in theſe kind of Headaches.*

A very large field of theſe Medicines are opened in phyſical Books, yet ſo, that the poorneſs of them, and their abundance, bring confuſion to the Method of healing; for oftentimes among ſo many various and different Remedies, heaped up together, lye hid or obſcured, what may be of great uſe, but even as Wheat among Chaff, harder to be ſeparated than that to be thorowly ſifted out from the husks *A great many of theſe every where to be found in Phyſical Books.*

Therefore in this caſe, a proviſion of the whole being made, and applyed, and things given which by Dyet or Medicine, reſtrain the Inordinations of the Blood, and immediately allay them; Medicines called Cephalicks, or ſuch as take away the diſorders of the nervous Juice, are preſcribed to be carefully taken. I ſhall add ſome few forms of theſe.

Take *of the Conſerve of the Flowers of Betony, of Clove-gilliflowers, each three ounces; of the Powder of the Root of the male Pœony half an ounce, of Cretick Dittanny one dram; of the wood Aloes, and yellow Sanders, each one dram; of red Coral prepared, of Pearl, of Ivory, each one dram and a half; of the Salt of Vervine one dram and a half, of the Syrup of the Flowers of Pœony, what will ſuffice: make an Opiat, take of it to the quantity of a Cheſnut, drinking after it of the following Julep three ounces.* *An Electuary.*

Take *of ſimple black Cherry water, and of Walnuts, and of Vervine, each four ounces; of Cowſlip Flowers three ounces, of Pœony Compound two ounces, of Sugar-Candy ſix drams.* *Julep.*

Take *of the Flowers of Vervine, Miſleto Berries, each ten handfuls; of the male Pœony Roots two pound, of Mace and Nutmegs, each half an ounce; of Coriander Seeds one ounce; cut and bruiſe them and put to them eight pints of new-milk (or elſe ſeven pints of Milk and one pint of Malago) Diſtil them in a comm'n Still, and mix all the liquor together: Take of it three ounces at a time.* *A diſtilled water.*

Take

Tablets. Take *of the Powder of the Root of the male Pœony half an ounce, of red Coral prepared two drams, of Ivory and Pearls prepared, each one dram; make of them all a very fine Powder, add to it of Sugar what will ſuffice; boil them to the conſiſtence of Tablets with ſix ounces of black Cherry-water, of the Tincture of Coral one dram; make of them Tablets according to Art, to the weight of half a dram: Eat three or four in the Morning, and at five of the Clock in the Afternoon, drinking after them a draught of Tea.*

Tinctures. Or Take *of the Tincture of Coral one ounce; take of it from fifteen to twenty drops twice in a day, in a little draught of Julep, or of the diſtilled water.*

Spirits. They who are of a Phlegmatick or more Cold temper may take a Doſe twice a day, either of the Tincture of Antimony, or of the Spirits of Armoniac, impregnated with Amber or Coral, or of Spirits of Harts horn, or of Sut, in a proper Vehicle.

The uſe of millepedes notably helps. We ought not to omit, or poſtpone the uſe of Millepedes or Woodlice, for that the Juice of them, wrung forth, with the diſtilled Water, alſo a Powder of them prepared, oftentimes bring notable help, for the Curing of old and pertinacious Headaches. I might here propoſe divers other kinds of Medicines; yea all thoſe which I have formerly heaped up, againſt Convulſive Diſtempers, may be brought hither. But yet the moſt difficult knot of the Cure of the Headach, remains to be untied, to wit, how the conjunct Cauſe of this Diſeaſe, and fixed, conſiſting in the weakneſs, or hurt Conformation of the Fibres, may be healed or taken away.

The other part of the conjunct Cauſe, conſiſting in the weakneſs or evil conformation of the diſtempered part, how to be handled. Although this is ſometimes incurable, to wit, when as a *Scirrhous*, or *Callous* Tumor, or ſome other old and fixed ſwelling, has poſſeſt the *Meninges*; yet, for that the knowledge of this is uncertain, and that the leading Cauſe, how cruel ſoever it ſeems, is ſometimes overcome by a long courſe of Phyſick; therefore in every Headach, ſo long as the Patient will admit of Remedies, let it not ſeem troubleſome to the Phyſician, to preſcribe thoſe things which ſeem moſt convenient.

We are not to deſpair of the Cure. Therefore, firſt of all, which we hinted before, you muſt carefully endeavour that the neſt, or feeding of the Diſeaſe be cut off or intercepted, and that the frequent coming of the fits be hindred; for ſo the indiſpoſed Fibres, ſo long as they are no more affected only by the means of Nature, will recover health.

Here thoſe Medicines are only profitable, that cut off the inkindling or root of the Diſeaſe. In this caſe the helps of the Medical Art, are rather to be ſought from the Chirurgical part, than from Phyſick: for whatſoever is taken at the mouth, going about by long turnings and windings, ſpends all the vertue before it comes to the Membranes of the Head.

Chyrurgical Remedies chiefly help here; of which are, 1. *Plaſters.* Among Chirurgical Remedies, firſt Topicks are met with, and among theſe, Plaſters are of moſt profitable uſe, and oftentimes give the greateſt benefit: Let not theſe be very hot, which may rather draw the humors to the diſtemper'd place, but moderately diſcuſſing and ſtrengthening. I was wont to preſcribe Plaſters of Red-Lead, and of Sope, with double of the proportion of the Plaſter of *Paracelſus*, to be applied to the part, it being firſt ſhaven, and to be let remain there for ſome time. The Antients frequently adminiſtred Plaſters made of Muſtard, and ſuch as raiſed wheals or whelks over the parts, and it is a daily practice to apply ſometimes to all the hinder part of the Head, and ſometimes to the former, Veſicatories or bliſtering Plaſters, againſt moſt cruel Headaches: when eaſe is got from theſe more hot *Topicks*, it is becauſe by theſe adminiſtrations, plenty of the more ſharp Serum is drawn away from the diſaffected part.

Medicines raiſing Whelks and Bliſters.

Liniments, Fomentations and Bathings, help not. Liniments of Oyls and Oyntments, though often made uſe of, effect little; becauſe (as I think) if they ſhould penetrate deeply into the tones of the Fibres, they would looſen them more; ſo that they would more eaſily lye open to the Incurſions of the Morbifick matter: Further, they ſtop up the Pores of the skin, whereby the Effluvia's do leſs evaporate. Almoſt for the ſame reaſon, as hot ſtupes or Fomentations made of boiled Spices, or other Cephalicks, oftner hurt than profit; foraſmuch as they draw the humors towards the diſtemper'd parts, and alſo open the Pores and paſſages, whereby they are more readily admitted; it is that a Bathing of the Head, or an Embrocation or waſhing of the Head, at the pumps in hot Baths, is uſed with no better ſucceſs for Headaches: When on the contrary, it hath been beneficial to many, to pour cold water every Morning and Evening on the temples, forehead, and forepart of the Head: yea to waſh or pump the whole Head, every Morning with cold water, or at leaſt to dip it into a Bucket or Pit of water.

An Embrocation, or a dipping of the head in cold water, oftentimes helps.

Iſſues. Another Chirurgical help, eſpecially for an inveterate and cruel Headach, and much cry'd up, is wont to be the burning or cutting of Iſſues, in ſeveral parts of the Body. It is without doubt, that theſe being made in the Arms or Legs, are both leſs troubleſome, and do bring ſomething of help: becauſe they draw away the feeding of the

Diſeaſe

Diſeaſe in part, and call it away far from the diſtemper'd part. Beſides, Iſſues in the nape of the Neck, and a Seaton in the hinder part of the Neck, behind the Ear, or near it; alſo a piece of the root of wild Hellebore, being put into an hole made in the Ear, becauſe they evacuate much ſeroſity, and draw it to other Emunctuaries, to wit, the Glandulas, are oftentimes adminiſtred with benefit. But indeed, there hath been a talk, and much expectation from Cauteries, made on the grieved place, or near it, and ſo large Iſſues have been made on the top of the Head, or nigh to the joyning of the Sutures. If we ſhould meaſure this practice by the fruit or ſucceſs, it will appear to be rarely beneficial, but more often unlucky. For I never knew any healed, but many troubled with Headaches, to be much the worſe for it. And truly, reaſon plainly tells us, that where a Fontinel is made, thither the Serous Humor flows, from the whole bloody Maſs, and by conſequence from the whole body, and oftentimes is there heaped up more copiouſly than can conſtantly be put forth by that Emiſſary: wherefore, there ordinarily ariſe about Iſſues, a red ſwelling, puſtles, and various humors. Why ſhould I not then believe, that a Cautery made nigh to the grieved part of the Head, ſhould rather cauſe the Morbific matter to be there heaped up?

Iſſues made upon or near the diſtempered place, help little.

There is yet another Chirurgical operation cry'd up by many for a pertinacious Headach, but by none (that I know of) yet attempted, to wit, an opening of the Skull, near the grieved place, with a *Trypaning* Iron. This our moſt ingenious *Harvey* endeavoured to perſuade a Noble Lady, labouring with a moſt grievous and inveterate Headach, promiſing a Cure from thence; but neither ſhe, nor any other would admit that adminiſtration. Indeed, it did not appear to me, that there could be any thing of certainty expected from the opening of the Skull where it was pained; if an Impoſthum lay hid there, this had been the only way of Cure; but that would rather have cauſed ſleepy diſtempers, or deadly Convulſions than the Headach. If that a red ſwelling, or puſtles, or a burning boil, ſhould be in the enfoldings of the Head, I know not if thoſe Tumors, expoſed to the open Air, would more eaſily evaporate, or whether Remedies applyed to thoſe naked places, would effect any thing or not; becauſe, if the pains ariſe by reaſon of the *Meninges* being beſet with little whelks, a Scirrhous or a Callous Tumor, I think the opening of the Skull will profit little or nothing.

The opening of the Skull cry'd up by many, but rarely or never attempted.

But letting this alone till it is practiſed, we ſhall paſs over to other things; and now in the next place, we ſhall conſider, whether Salivation for the Curing old and confirmed Headaches is to be adminiſtred. Indeed, if the pains of the Head ariſe from the Venereal Diſeaſe, no doubt but that evil Remedy ought to be applyed to that evil Diſtemper: But having tryed that kind of remedy in Headaches ariſing from other Cauſes, I found not the harveſt worth the pains, and I confeſs ſome examples in thoſe kind of caſes, have terrified me from that method. A certain noble Lady (whoſe ſickneſs is below deſcribed) for the Curing of a cruel and continual Headach, underwent a plentiful Salivation three times, *viz.* the firſt by a Mercurial Oyntment, by the counſel of Sir *Theodore Mayern*, and afterwards twice by taking the lately famous Powder of *Charles Huis*, without any help, I wiſh not with ſome detriment: for afterwards for many years, even to this day, the diſeaſe being by degrees increaſed, ſhe ſuffer'd under its heavy tyranny. It happened ſomewhat worſe, ſo that noted man Doctor *G. D.* to whom a Mercurial Oyntment was applied for his akeing Head, for the Cure of an old Headach, by which a Salivation being excited, and the Diſeaſe not Cured, he fell into blindneſs. Indeed theſe kind of effects from Quickſilver, raſhly given, every one, rightly weighing its operation on an humane body, ought to fear. For the Mercury, I ſhall not ſay is malignant or wholely venomous, becauſe it brings little or no hurt, its particles being united, ſo that oftentimes a great quantity may be taken ſafely enough; yet the Mercurial little bodies, being divided and ſeparated one from another, (whether it be done by Chymical Salts, as in the Mercury ſublimate, and precipitate, or by ſtraining thorow the Pores of the Skin when they are anointed) immediately become fierce and untameable, and ſtir up, before any other Medicines, great perturbations in the humane body: They ſometimes bring trouble, firſt to the nervous parts, whereby oftentimes happen, (by reaſon of the Fibres of the Ventricle, Inteſtines, and other Viſcera's, being pulled or hauled) Torments, horrid Vomitings, ſharp and frequently Bloody-ſtools, Heart-burnings, Swoonings, and other moſt terrible Diſtempers, a little after the Medicine is given. Yet ſometimes the particles of the Mercury, when they are not preſently diſſolved, go forth without any great hurt to the Bowels, and before their ſtrength be deduced into the bloody Maſs. Therefore they eaſily enter into this, being highly active, and unfolding themſelves on every ſide, and immediately infecting the whole,

Whether ſalivation in inveterate Headaches, without any ſuſpicion of the Venereal Diſeaſe, ought to be adminiſtred.

The means and manner of ſalivation by Mercury, unfolded.

ſhake

ſhake it, and frequently (when fully diſſolved) ſtir it up into a great burning. Then the Blood, that it might put away from it ſelf, the incongruous little bodies, Fermenting, delivers the ſame which way it can, and boils it with the humors, contained within its boſom, to wit, the Serum and the nouriſhing Juice, and ſo endeavours, with thoſe imbued with that preternatural mixture, to put it off. But this ſucceeds not plentifully enough by Urine and Sweat, becauſe the meltings of the Blood, by the particles of the Mercury boiled in it, like the ladder of a Waſh-Ball, become more clammy and thick, ſo that they cannot paſs thorow the fine ſtrainers of the Reins and the Skin, but oftentimes breaking forth (unleſs hindred) into the *Cæliac* Arteries, go forth, by exciting a *Diarrhœa* or *Dyſentery*; but by that the intent of Salivation is hindred or fruſtrated: but more often, the Liquor imbued with the *Mercury*, remaining within the Blood, in a manner alſo infected, is carried about with it, hither and thither, impetuouſly thorow the Arteries and Veins, and is ſeparated into various parts, and either breaks forth what way it can, or is forced upon the Bowels, Membranes, and other parts, oftentimes with great hurt. Alſo it is ſeen that ſome Mercurial particles do penetrate the Brain, and inſinuating themſelves into the nervous Juice, are diffuſed, not only into the whole Head, but into all the nervous parts, and ſo in ſome meaſure ferment the nervous Liquor.

But in the mean time the Mercurial Seroſities, reſiding in the Blood, are laid up for the greateſt part into the Glandula's, which are the neareſt Emunctuaries of the Arteries: wherefore, when the Glandula's about the parts of the Mouth (by which great plenty of Serum is deſtinated for ſpittle) being both many and great, are there placed, and that from theſe paſſages lye open, by the Excretory Veſſels, into the cavity of the Mouth; ſurely by this moſt certain way, the invenom'd liquor of the Blood, finds a paſſage forth, when it cannot eaſily elſewhere. Wherefore, a ſpitting at the Mouth being excited, the Blood long Fermenting, caſts forth whatſoever is extraneous, and not agreeable, either that lyes in its boſom, or that it licks up elſewhere from the Bowels, or receives from the ſolid parts, or from other humors, like working Ale or Wine, thorow the Salival paſſages, and innumerable pipes opening every where into the Mouth. Further, it is moſt likely, as the purgings of the Blood, ſo alſo of the liquor watering the Head, and the nervous Appendix, being excited by the Mercury entering therein, are alſo put forth by this way, to wit, by the Salival paſſages.

Therefore, a Salivation induced by Mercury, if by chance it ſucceeds rightly, it ſometimes takes away difficult and untameable Diſeaſes, not to be dealt with by any other Remedies; becauſe this operation thorowly purges the Blood and nervous Juice, and other humors, by a long purgation, deſtroys all exotick Ferments, overcomes the enormities of the Salts and Sulphures; yea, and ſhakes, and oftentimes carries forth the Morbific matter, where-ever remaining or impacted.

Salivation not always ſafe, wherefore to be ſuſpected in Headaches.

But this Medicine is not without danger, foraſmuch as the Mercury becoming enormous, and carrying with it abundance of moſt ſharp, and as it were poiſonous Serum, ruſhing on the noble parts, and eſpecially the Head, with the Medullary and nervous appendixes, or on the Lungs, and parts about the Heart, brings to them an incurable and ſometimes a deadly evil. Wherefore in a more grievous and old Headach, there is danger leſt the indiſpoſed Fibres ſhould be more irritated, by the Mercury going thorow them, with much, and corroſive Serum, and ſhould move them into more painful Convulſions and wrinklings; further, leſt it ſhould invade the Brain, by a great falling of the Humors upon the Head, by which means, as it often happens to the Brain, ſleepy and Convulſive diſtempers are cauſed. I ſhould have ſaid many things more concerning this, but that we expect ſhortly to be made publick, by the Learned Phyſician Doctor *Needham*, an exact method of Salivation, and a full account of it, as to its meaſures and effects, and its benefits and hurt.

What the cutting of the Artery may profit in this Diſeaſe.

There is yet a celebrated Remedy remaining among Chirurgical helps, *viz.* a cutting or opening an Artery. This was of great eſteem among the Ancients, and ſome of the Moderns make uſe of it, and very much cry it up. But it appears to our obſervation, that this ſo cry'd up ſucceſs moſt often fails. Nor no wonder, becauſe reaſon holds not at all, on which the Ancients depended, that the Arterious Blood was different from the Venous, or that of the Veins, and was in greater fault and more rageing, and therefore to be let forth. Nor indeed is there any reaſon wherefore the Blood being drawn from the Artery, rather than from the Vein, near the pained place, ſhould bring eaſe; but rather on the contrary, more help ought to be expected from opening of the Vein; becauſe, the Artery being emptied, receives and draws nothing from the diſtemper'd part; but the Vein being opened, draws from the

the place of the effuſed Blood, and from its whole neighbourhood, and oftentimes ſupps back, and renders to a Circulation the Blood, and other Humors, heaped up and ſtagnating near the neſt of the Diſeaſe. But however, that we may not recede too much from the practice of the Ancients, we ſhall grant, that ſometimes it may be helpful, though attributing nothing to the ſection of the Artery, and not immediately, yet cauſally, and only by conſequence and by accident: to wit, foraſmuch as the ends of the Artery being cut, grow faſt together, ſo that the paſſage of the Blood by that way is ſhut up for the future; from hence when as a leſſer proviſion of Blood is carried by the Artery towards the place: and the like ſtill carried away from it by the Veins, it therefore ſometimes happens, that the neſt of the Morbific Matter ſometimes leſſened, and its mine is by degrees conſumed. For this reaſon, this adminiſtration oftentimes ſucceeds happily in diſeaſes of the Eyes. Further, Farriers make uſe of the like practice for the Curing of evil tumors in the Legs of Horſes; to wit, they take and bind the Artery, by which the Matter flows to the diſtemper'd part, and in the mean time, that which was impacted, partly evaporates, and is partly ſupped up by the Vein. And I have heard, that the ſame has been try'd by our *Harvey*, and not without ſucceſs, for the Curing alſo of *Strumous* and *Scirrhous* Tumors in the humane body. I might here ſubjoyn many other kinds of Remedies, yea alſo the preſcriptions and forms of Medicines, which are wont to be adminiſter'd for the Curing of Headaches, both by *Phyſicians* and by *Empericks*: but enough of theſe are to be had in Phyſical Books. It will be to our purpoſe, that after the delivering the *Ætiology*, or the reaſon of this Diſeaſe ſo confuſedly ſhown, and its *Therapeutic* or Curatory part ſufficiently ſhadowed, for the more clear illuſtrating of theſe things, that we add ſome more rare caſes of ſick perſons, and examples of a continual and moſt grievous Headach, which alſo for an invincible cauſe was oftentimes deadly.

Nevertheleſs in this Diſtemper it is often helpful, and by what means, is ſhewn.

Farriers uſe the like practice.

And perhaps it may be convenient for the curing of ſtrumous or running humours, ſuch as the Kings Evil.

A Woman of about fifty years of age, after ſhe had labour'd for about ſix months with a moſt grievous pain in the Head, troubling her almoſt perpetually, under the *Sagittal* Suture (or the ſeam that goes thorow the length of the Skull, dividing it into two parts) yielding to no Medicines, or method, at length fell into a *Lethargy*, with a partial reſolution of her members; from which notwithſtanding, being ſhortly recovered by timely Remedies, ſhe awaked with the Headach, as cruel as before; moreover, within two or three weeks after, relapſing into the ſleepy diſtemper, ſhe departed this life. Her skull being opened, there grew from the ſide of the third boſom, to the Membranes, a *Scirrhous* Tumor three fingers broad, by the coming between of which, both the *Dura mater* for a little ſpace was grown to the *Pia mater*, and the ſanguiferous Veſſels, which ſhould open there into the cavity of the boſom, were ſtopped up. Further, the cranklings or turnings in of the Brain, both the exterior and the inward cavity, was filled with a clear water. From theſe things being obſerved, the invincible and at length deadly cauſe moſt clearly appeared: to wit, the moſt ſenſible Fibres of the *Meninges* being continually pulled and torn, partly by reaſon of the breaking of the unity, and partly from the humor belonging to the Nerves, being there heaped up and ſtagnating, together with others flowing thither, and growing hot with it, were provoked into Convulſions perpetually, or painful Diſtentions: Afterwards, when the Blood being for a long time hindred in its circulation, by reaſon of that Tumor, or that at leaſt it could not paſs thorow it, by any means, ſent copiouſly away from it ſelf the Serous Water (as its manner is whereever it finds an hindrance) and at length a *Dropſie* in the Brain was raiſed, which was the cauſe of the deadly *Lethargy*. I remember I have ſeen the like caſe in another, whom I have opened. Further, as I think, the diſeaſe in many troubled with Headaches, doth depend on the like invincible cauſe; I will however deſcribe one example yet living, of this kind of Diſtemper.

The Hiſtory of a continual and a deadly Headach.

A continual and inveterate Headach paſſing into a Lethargy.

Some years ſince, I was ſent for to viſit a moſt noble Lady, for above twenty years ſick with almoſt a continual Headach, at firſt intermitting: She was of a moſt beautiful form, and a great wit, ſo that ſhe was skilled in the Liberal Arts, and in all ſorts of Literature, beyond the condition of her ſex; and as if it were thought too much by Nature, for her to enjoy ſo great endowments, without ſome detriment, ſhe was extreamly puniſhed with this Diſeaſe. Growing well of a Feavour before ſhe was twelve years old, ſhe became obnoxious to pains in the Head, which were wont to ariſe, ſometimes of their own accord, and more often upon every light occaſion. This ſickneſs being limited to no one place of the Head, troubled her ſometimes on one ſide, ſometimes on the other, and often thorow the whole compaſs of the Head. During the fit (which rarely ended under a day and a nights ſpace, and often held for two, three, or four days) ſhe was impatient of light, ſpeaking, noiſe, or of any motion, ſitting upright in her Bed, the Chamber made dark, ſhe would talk to no body, not

A ſecond Hiſtory of an incurable Headach, in a moſt noble Lady labouring with it for twenty years.

take any ſleep, or ſuſtenance. At length about the declination of the fit, ſhe was wont to lye down with an heavy and diſturbed ſleep, from which awaking, ſhe found her ſelf better, and ſo by degrees grew well, and continued indifferently well till the time of the intermiſſion. Formerly, the fits came not but occaſionally, and ſeldom under twenty days or a month, but afterwards they came more often: and lately, ſhe was ſeldom free. Moreover, upon ſundry occaſions, or evident cauſes (ſuch as the change of the Air, or the year, the great Aſpects of the Sun and Moon, violent paſſions, and errors in diet) ſhe was more cruelly tormented with them. But although this Diſtemper moſt grievouſly afflicting this noble Lady, above twenty years (when I ſaw her) having pitched its tents near the confines of the Brain, had ſo long beſieged its regal tower, yet it had not taken it: for the ſick Lady, being freed from a Vertigo, ſwimming in the Head, Convulſive Diſtempers, and any Soporiferous ſymptom, found the chief faculties of her ſoul ſound enough.

Remedies of every kind for the curing this Headach, try'd in vain.

For the obtaining a Cure, or rather for a tryal, very many Remedies were adminiſtred, thorow the whole progreſs of the Diſeaſe, by the moſt skilful Phyſicians, both of our own Nation, and the preſcriptions of others beyond Seas, without any ſucceſs or eaſe; alſo great Remedies of every kind and form ſhe tryed, but ſtill in vain. Some years before, ſhe had endured from an oyntment of Quickſilver, a long and troubleſome Salivation, ſo that ſhe ran the hazard of her life. Afterwards twice a Cure was attempted (though in vain) by a Flux at the Mouth, from a Mercurial Powder, which the noted Emperick *Charles Hues* ordinarily gave: with the like ſucceſs with the reſt ſhe tryed the Baths, and the Spaw-waters, almoſt of every kind and nature: ſhe admitted of frequent Blood-letting, and alſo once the opening of an Artery; ſhe had alſo made about her ſeveral Iſſues, ſometimes in the hinder part of her Head, and ſometimes in the forepart, and in other parts. She alſo took the Air of ſeveral Countries beſides her own native Air, ſhe went into *Ireland* and into *France*: There was no kind of Medicines both *Cephalicks*, *Antiſcorbuticks*, *Hyſterical*, all famous *Specificks*, which ſhe took not, both from the Learned and the unlearned, from *Quacks*, and old Women; and yet notwithſtanding ſhe profeſſed, that ſhe had received from no Remedy, or method of Curing, any thing of Cure or Eaſe, but that the contumacious and rebellious Diſeaſe, refuſed to be tamed, being deaf to the charms of every Medicine. Further, this ſo long poſſeſſing the out-parts of the Head, though it could not invade the cloyſters of the Brain; yet, when I viſited her, unfolding its ends in ſome other parts of the nervous kind, it had begun to ſtir up moſt cruel pains in her members, and alſo in her Loins, and bottom of her Belly, as is wont to be in the *Rheumatiſm*, and in the *Scorbutick Colick*.

Conjectures concerning the reaſon of this cruel Diſeaſe.

If we ſhould inquire into the *Ætiology* or the Cauſes of this inveterate Diſeaſe, we can ſuſpect nothing leſs than that the *Meninges* of the Brain, being from the beginning more lightly touched, had afterwards contracted an habitual and indelible vice. It appears by the Hiſtory, that the diſtemper at firſt aroſe from a Morbific matter, which was tranſlated into the Head, after an ill cured Feavour. Then perchance, by reaſon of ſome hurt brought to the Membranes, the tone of the Fibres was ſo much endamaged, that afterwards, the Humors flowing in them, both the nervous and others, being heaped up to a fulneſs, or growing hot by mere aggravation, raiſed up the fits of the Headach. But at length the diſeaſed cauſe growing worſe, by reaſon of the frequent fits, it ſeems that the unity of thoſe Fibres, were ſo much broken, that from thence little Tumors, or *Scirrhous* knots or ſwellings, being riaſed up in all the exterior *Meninge*, or in a great part of it, produced pains almoſt continual, and thoſe apt to be made worſe or imbitter'd upon every light occaſion: Certainly it ſeems moſt likely, that the invincible and permanent cauſe of ſo long, and yet not deadly Headach, proceeds from ſome ſuch thing, *viz.* a *Scirrhous* Diſtemper of the *Dura mater*, the *Pia mater* being in the mean time ſafe. For from any other cauſe, if there had beee a conflict of Nature and Medicine with the Diſeaſe, either a quick death or a joyful victory had far ſooner been obtained.

A third Hiſtory of a deadly continual Headach.

A noted Gentleman of about forty years of Age, ſtrong and healthy, going a journey for a whole day in a continual rain, the wet beating on the hinder part of his Head, caught cold, and the next day he began to feel a pain in that part; which in a ſhort time after becoming very bitter, afflicted him night and day, and kept him almoſt continually without ſleep. For the Cure of this Diſtemper, Phlebotomy, Purging, Gliſters, Bliſterings, and Remedies to cauſe reſt; yea and many others of every kind, though diligently applyed, by the Counſel alſo of many Phyſicians, helpt little or nothing. When the Diſeaſe notwithſtanding theſe, grew every day worſe, after a fortnights time, preternatural ſwell'd kernels and painful aroſe all about his Neck, the pain in his Head nothing remitting: Further, the Tendons of his Neck being

being very much diſtended and ſtiff, became very troubleſome to him; to which, in a ſhort time, ſucceeded Convulſive motions, and a ſudden leaping of the Tendons, in ſeveral parts, with a delirium, and at length, the ſick perſon worn out with pains and watching, yielded to death.

A conjecture concerning the reaſon of the Diſeaſe.

Though we had not leave for the diſſecting the dead body, yet it may be ſuſpected, that both the *Pericranium*, and the *Meninges* in the hinder part of the Head, cloathing the *Cerebel*, where they are more thick and very nappy, were firſt affected; and then from thence the evil was afterwards communicated to the whole Head, and wandered into all the nervous ſtock: when as in thoſe Membranes, tranſpiration was hindred, from the cold and the wet, and alſo the tone of the Fibres very much hurt, it is probable, that the nervous Liquor watering them, being then hindred in its motion, and ſtagnating, did burthen the containing bodies; then that being depraved in its Complexion, grew hot with other humors flowing thither, and being at length coagulated with them, grew together into *Scirrhous* and *Strumous* Tumors, and ſo laid the copious ſeed-plot of a moſt grievous Headach: Then afterwards, when through watching and perpetual pains, a great inordination of the Spirits, and a great *Diſcraſie* of the Juice watering the Head, were produced; for that reaſon, the knotty Concretions in the Neck, the ſtifneſs of the Tendons, and at length Convulſions and Convulſive Motions followed in the Brain, and in the whole nervous Stock: and ſo, when as ths animal œconomy or regiment was much decayed, and that the motion of the Præcordia could not be continued, the vital flame expired.

A fourth Hiſtory of an Headach, excited from a fiery Swelling, or an Inflammation of the Meninges.

Sometimes deadly and incurable Headaches are no leſs raiſed up from a fiery ſwelling and Impoſthum, than from theſe kind of knots, and little pimples of the *Meninges*. Sometime ſince, a young man of the Univerſity, whenas he had complained for a fortnight of a moſt grievous pain in the Head, inceſſantly afflicting him; it was at length increaſed by a Feavour, and afterwads, waking, Convulſive motions, and talking idly followed; at which time a Phyſician being ſent for, letting blood, Clyſters, Plaſters, Revulſives, Bliſtrings, alſo internal Remedies which call away the Flux of the Blood and Humors from the Head, being carefully adminiſtred, profited nothing; ſo that death ſoon followed. His Skull being opened, the Veſſels leading to the *Meninges* were full of Blood, and very much diſtended, as if the whole Maſs of Blood had flowed thither, ſo that the boſoms being diſſected and opened, the Blood preſently ruſhing forth, flow'd to the weight of ſeveral ounces above half a pint: Further, the Membranes themſelves being diſtemper'd thorow the whole, with a fiery Tumor, appeared diſcoloured: Theſe coverings being taken away, all the infoldings of the Brain, and of its Ventricle, were full of a clear water, and its ſubſtance being too much watred, was wet, and not firm. Without doubt in this caſe, the incurſion of the heated blood into the *Meninges*, and the heaping of it up there, exciting the *Phlgemon* or fiery ſwelling, was the cauſe of the Headach, and of the following *Delirium*: Then the Blood being accumulated there, when it could not circulate, flung from it ſelf plenty of *Serum*, by which the whole inward part of the Head was over-flowed; ſo that the Diſeaſe, at firſt perhaps curable by Phlebotomy, from thence afterwards became mortal.

An Hiſtory of an Headach raiſed up from an Impoſthume in the Meninges.

I remember another *Academick*, who after a long Headach, under the temporal Suture, tormenting him perpetually for three weeks together, immediately fell into a deadly *Apoplexie*. His Head being opened, a fiery ſwelling had grown in the *Meninges*, near the place where the pain was, from which, being ripened and broke, the filthy bloody matter falling on the Brain, had diſtemper'd its ſubſtance with a rottenneſs and blackneſs. Beſides, theſe invincible cauſes, detected by *Anatomy*, I obſerved more chances after the ſame manner, as of other ſick people; by which we may conclude its *Ætiology*, to be the ſame, or very near of kin, with the ſigns and ſymptoms of the like nature, and but now deſcribed.

A continual Headach, not always to be accounted incurable.

But although a continual Headach (eſpecially if it be without intermiſſions for many weeks) is not without danger: yet we ought not therefore to deſpair of its Cure, becauſe the cauſe of this, how fixed and immoveable ſoever it ſeem, oftentimes by the long uſe of Medicines, and ſometimes without them, is helped by Nature and time: however, in a caſe almoſt deſperate, there is need of ſome Medicines, leſt the preſent Diſtemper ſhould paſs into a worſe, to wit, a Soporiferous or Convulſive. Thus much for a Continual Headach: it now remains, that we ſhould propoſe ſome more rare examples and inſtances of the *Intermitting*.

An intermitting Headach, whoſe Fits are uncertain, are ſo frequent that we need ſhew no inſtances of it.

Therefore, that we may let alone here, the Headaches, whoſe fits being wandring and uncertain, proceed from the Blood or Serum ruſhing on the diſtemper'd places, as caſes very well known, and commonly ſeen; we ſhall now ſhew you now ſome ſelect Obſervations of this Diſeaſe, either periodical, or cauſed by the conſent of ſome Inward:

Inward: As to the firſt, we have ſhown the periodical fits of the pains of the Head, to be produced by the nutritious Humor, or by the nervous Juice: we ſhall now ſhew you Examples of either.

The ſixth Hiſtory of a periodical intermitting Headach.

A venerable Matron of about forty five years of Age, of a lean habit of Body, and indued with a Cholerick Temper, after ſhe had lived for a long time obnoxious to Headaches, wont to be cauſed occaſionally, ſhe began about the beginning of Autumn, to be troubled with a periodical pain of the Head: This Diſtemper invading her about four of the Clock in the Afternoon, was wont to continue till midnight, when being wearied with pain and watching, ſhe was compelled to ſleep; then afterwards awaking out of a profound ſleep, ſhe found her ſelf well again. She being ſick after this manner for three weeks, ſuffered the daily fits of this Diſeaſe, and forbore to take any Medicine, which ſhe greatly abhorr'd; but at length her Appetite being loſt, and her ſtrength worn out, being forced to ſeek for Cure; after letting blood and a gentle Purge, ſhe took twice a day for a week or two, the quantity of a Cheſtnut of the following *Electuary*, and grew perfectly well.

The Cure of the ſame.

Take *of the Conſerve of the Flowers of Succory and Fumitory, each three ounces; of the Powder of the Root of Aron Compound two drams and a half, of Ivory one dram and a half, of yellow Sanders, and of Lignum Aloes, each half a dram; of the Salt of Wormwood one dram and a half, of Vitriol of Steel one dram, of the Syrup of the Five Roots what will ſuffice to make an Electuary.*

The reaſon of this Caſe unfolded.

In this Caſe, that after a diſpoſition to the Headach, the fits of the Diſeaſe became at length periodical, after the manner of intermitting Feavours, the cauſe without doubt was, the aſſimilation of the *Chyme*, or nouriſhing Humor, into Blood, being hindred: becauſe, when its proviſion being received into the Maſs of Blood, could not be overcome, it was wont after a little ſtay to diſagree, and with its particles, to grow hot; therefore preſently the Blood ſwelling up, that it might ſhake off the incongruous mixture, laid aſide its recrements, as in other parts, ſo eſpecially and with a greater ſenſe of trouble into the before weak Fibres of the *Meninges*, or hurt in their conformation: This Matter being poured on the Head, or ruſhing of it ſelf thorow the ſenſible Fibres, or growing hot with the Juice watering them, raiſed up the fit of the pain but now deſcribed; which continued until the heterogeneous particles growing hot, with their mutual coming together, were either ſubdued or exhaled.

The ſeventh Hiſtory of the ſame Diſtemper, excited by the default of the nervous Liquor.

A very comely Woman, tall and ſlender, being for a long time grievouſly obnoxious to diſtempers of the Head, was wont ſometimes to be troubled for many days, yea weeks, every day as ſoon as ſhe awaked in the Morning, with a moſt Cruel Headach, afflicting her for three or four hours: and in the mean time, ſhe was vexed with a weight of her whole Head, a numneſs of her ſences, and a dulneſs of mind: which kind of Diſtemper, together with the pain, like diſcuſſed Clouds, vaniſhed before noon, and left her quiet and calm: Then again the next morning, it poſſeſſed her Head like a dark Cloud. For the Curing of it I preſcribed the uſe of Purging Pills, Phlebotomy ſparingly, beſides a Bliſtering, and Spirits of Harts-horn, or of Sut, with *Cephalic* Juleps or Waters.

The Cure of it.

The reaſon of the Caſe unfolded.

That in this Lady, otherways than in the other ſick Lady, the pains of the Head rather followed after ſleep, than were healed by it, the reaſon ſeems to be, becauſe in this morning Headach, the Morbific Matter reſided in the nervous Juice, whoſe more notable crudity, and fuller aggeſtion about the Head, happen immediately after ſleep, as we have elſewhere ſhown at large: But the other Evening fits of this Diſeaſe, depended upon the fulneſs and ſwelling up of the nouriſhing Liquor within the bloody Maſs, and therefore happening ſo many hours after dinner, was not allayed but by ſleep, which quiets the diſorders of the Blood.

An Inſtance of an intermitting Headach, which ſeem'd to be excited from the Womb.

It doth no leſs clearly appear, that the fits of the Headach do ariſe, ſometimes by conſent from other parts, *viz.* the Womb, Spleen, Stomach, *&c.* and though the complaints, and the experience of the ſick, declare it to ariſe from Vapors, yet from the Hiſtories of them, and their appearances rightly weighed, 'tis moſt clear, that this proceeds from another reaſon, than from Vapors carried to the Head from the diſtempered inward. And in the firſt place, as to the pains of the Head, that ſeem to ariſe from the Womb, there is nothing more frequent than that upon the ſuppreſſion of the Monthly Flowers, or the *Lochia* after being brought to bed, or (as they call it) the flooding, for cruel Headaches to ſucceed. Further, although the Terms do rightly flow, yet ſome at the inſtant of its flowing, others at the ſtopping of the ſame, are wont to be troubled with a cruel pain of the Head. But indeed, though

though at the ſame time, as the Head, the Womb alſo is diſtemper'd: however it doth not follow, that the evil is transferred from hence, thither immediately: but the Blood it ſelf, which fixes the Morbific Matter to the Head, carries it, ſometimes begotten in its proper boſom, and deſtinated to the Womb, wrongfully into the *Meninges* of the Brain; and ſometimes ſnatching it from the parts of the Womb, delivers it with greater malice to the Head. This ſame reaſon may alſo ſerve for the Headach, commonly attributed to the Stomach, Spleen, and other parts.

The eighth Hiſtory of an intermitting Headach, ſeeming to ariſe from the Stomach.

A beautiful and young Woman, indued with a ſlender habit of body, and an hot Blood, being obnoxious to an hereditary Headach, was wont to be afflicted with frequent and wandring fits of it, to wit, ſome upon every light occaſion, and ſome of their own accord; that is, ariſing without any evident cauſe. On the day before the coming of the ſpontaneous fit of this Diſeaſe, growing very hungry in the Evening, ſhe eat a moſt plentiful Supper, with an hungry, I may ſay greedy appetite; preſaging by this ſign, that the pain of the Head would moſt certainly follow the next Morning; and the event never failed this Augury. For as ſoon as ſhe awaked, being afflicted by a moſt ſharp torment, thorow the whole forepart of her Head, ſhe was troubled alſo with Vomiting, ſometimes of an Acid, and as it were a Vitriolick, Humor, and ſometimes of a Cholerick and highly bitteriſh: hence according to this ſign, this Headach is thought to ariſe from the vice of the Stomach.

A reaſon of the Caſe delivered.

That I may render a reaſon of this, firſt it appears, that a Vomiting will ſucceed a hurt upon the Head, to wit, after a blow, or wound, or a fall; yet a pain of the Head rarely or never follows, upon Vomiting, the pain of the Heart, or the Stomach, any otherways labouring, unleſs the Blood comes between. Wherefore in the aforeſaid caſe of the ſick perſon, as it appears plainly that the *Meninges* of the Brain were before diſpoſed to Headaches, its fits were ſtirred up by every agitation of the Blood; hence it is obvious to be conceived, when the heterogeneous particles are heaped up together to a fulneſs, in the bloody Maſs, by reaſon of the vice of the Chyle, preſently a flux of it ariſing, for the expulſion of the trouble, thoſe being but evilly match'd, being ſeparated by the Blood, and partly poured forth out of the Arteries into the Ventricle, do raiſe up its Ferment, and ſo produce hunger; and partly ruſhing into the prediſpoſed *Meninges* of the Head do there diſpoſe the tinder, or rather incentive of the Headach about to follow. This ſick Gentlewoman, averſe to all Phyſick, when ſhe would undergo no method of Medicine, at length became obnoxious alſo to Paralytick, and Convulſive diſtempers. Out of theſe it will be eaſie to deſign the reaſon of every other Headach, *viz.* of the *Hypochondriac*, *Hepatic*, or otherways *Sympathetical*, ſo that there need not here to be added any more Hiſtories or Obſervations.

The like reaſon is for other Headaches, ſeeming to ariſe from the Spleen, Liver, Meſentery, &c.

CHAP. III.

Of the Lethargy.

THUS far we have deſcribed, by what Diſeaſe chiefly, and after what ſort, the out-skirts of the Head, or the coverings of that encloſed within the Skull, are wont to be affected; and now deſcending to its more internal part, and which lyes next to the Cortical or ſhelly ſubſtance, we ſhall ſee to what diſtempers this part is found to be chiefly obnoxious. We have ſhew'd at large in another place, that the *Cortex* or ſhelly part of the Brain is the ſeat of the Memory, and the porch of ſleep: wherefore, we rightly referr the Diſeaſe, which is wont to cauſe an exceſs of ſleep, and an eclipſe or defect of memory, to wit, the *Lethargy*, to that Cortical part of the Brain.

The Seat of the Lethargy is the ſame with that of Sleep and Memory; to wit, about the Skull of the Brain.

The word *Lethargy* is wont to ſignifie two ſorts of Diſtempers, which are as it were the act and the diſpoſition of this Diſeaſe; for thoſe who are ſaid to labour with this Diſeaſe, or are ſick of its great aſſaults, are overwhelmed with ſo great ſleepineſs, that they can ſcarce be excited by any impreſſion of a ſenſible object, yea if by chance being prick't or pinch't, they open their Eyes, or move their members, preſently they let them fall again, and become inſenſible; and oftentimes when left to themſelves indulging a perpetual ſleep, by an eaſie tranſition, they paſs into death it ſelf, whoſe type this Diſeaſe is; which kind of fits, have often a Feavour joyned with them, which when the ſick awake, and return perfectly to themſelves, for the moſt

By this name both the Fits of the Lethargy are called,

part

And also the soporiferous disposition, or Sleepiness;

part ceases of its own accord. Or secondly, they are accounted *Lethargical*, who being oppressed with an immoderate torpor or numness of the senses, are found to be almost ever prone to sleep; so that in the midst of a journey, yea at dinner, or though busied about any thing, they presently fall into a drousieness. But as there are diverse degrees, and various manners of this sleepy distemper, so also they constitute the various kinds of this *Lethargick* disposition. We shall for the present speak first of the former *Lethargy*, and properly so called, and afterwards of continual Sleepiness, also of the *Coma*, *Caro*, and other soporiferous Diseases akin to it, and likewise of Continual Waking.

Of which there are various kinds: The continual Sleepiness, the Coma, &c.

In every Lethargick Distemper there is an excess of Sleep, and a defect of Memory.

In the mean time, it is to be noted, that almost in every kind of Lethargy, there is always as its *Pathognomick* sign, a Torpor or Sleepiness, and oblivion or forgetfulness. Those who suffer the more grievous fits of this Disease, if they are awakened by any force in their declination, forget all things, nor are they able to remember their own, nor the names of their Friends: also, those who have drunk more sparingly of this forgetful cup, as much as they are proclive to Sleep, so much are they deficient in Memory; so that they forget late actions, and oftentimes repeat things done, and very often ask the same questions: As to the other faculties, as Reason, Phantasie, the sensitive and loco-motive powers, the failings or defects of them, are proportionate according to the enormities of Sleep and Memory. Wherefore, that the formal reason, and the causes of the *Lethargy*, may be the beter known, we should here first of all discourse concerning sleep and oblivion, and for what causes they are excited.

The essence and causes of natural and non-natural Sleep, rehearsed.

But having already discoursed concerning the former of these, we shewed that the essence of Sleep did consist in the corporeal souls withdrawing it self by little and little, and contracting the sphere of its irradiation, left destitute and as it were shut forth of doors, the outmost compass of the Brain, or its shelly part, and so the exterior, and all the organs of sense and motion, from the emanation of the spirits; so that they for refreshment sake, being called inward, lye down and give themselves to rest; in the mean time, the Pores and passages of the outward part of the Brain, being free and empty from the excursions of the spirits, are prepared for the coming of the nervous Liquor, stilled forth from the Blood, for a new provision of Spirits. In accustomed and natural Sleep, these two causes conspire and happen together, as it were out of a certain mutual compact of Nature; *viz.* at the same time, the Spirits give place, the nervous Humor enters: but in unnatural sleep, or that which is extraordinary, sometimes this cause, and sometimes that is the former; for the Spirits being wearied or called away, first withdraw themselves, and so offer an entrance to the nervous humor heaped up before the doors; or else the nervous humor driving to those places more plentifully, and as it were making its way by force, repels the Spirits, and entring into their passages, does as it were drown them: we have particularly assigned the various occasions of either of these, and after what manner they come to pass. Concerning the eclipse or defect of the Memory, we need not speak much here, because it is wholely from the same cause, as immoderate Sleep, to wit, the exclusion, and an interdiction for a time, of the passing up and down of the Animal Spirits, from the exterior passages of the Brain, full of some humor.

The causes of preternatural Sleep are,

Preternatural Sleep, or an insatiable sleepiness (which is the chief *symptom* in the *Lethargy*, and sleepy Diseases) seems to arise wholely from the same causes as non-natural Sleep, carried forth only with greater force or energy; to wit, either the Animal Spirits, being first distemper'd, leave the outward compass of the Brain, and give an entrance, not only to the nervous, but to the serous, and some other vicious Humor; or else, the superfluous and excrementitious humors, together with the nervous, break thorow the cortical doors of the Brain, and as it were overflowing its Pores and passages, drive thence and repel the Spirits; sometimes this is chiefly the cause, sometimes the former, and sometimes both together. We shall first speak of that which is the more frequent cause of the *Lethargy*, to wit, the eruption of either too much, or too incongruous humor, upon the confines of the Brain, and then afterwards of the departure of the Spirits from the affected part.

An infartion or obstruction of the outward part of the Brain, and a recess of the Spirits from thence: Sometimes this, sometimes that, is the cause.

The Lethargy oftentimes from the serous heap overflowing the outward part of the Brain: And sometimes from a Dropsie of the whole Brain.

I have often found by Anatomical observation, that the *Lethargy* doth arise from the Serous heap rushing into the outward infoldings of the Brain, and entering into its Pores and Cortical passages; for in many dead of this Disease, I found the spaces between the foldings of the Brain, full of clear water, yea and its outmost substance soft and infirm, from too much wet; moreover in some I found the interior cavities swelled with water, and the whole frame of the Brain overflowed with a Dropsie, or rather a flood. When therefore in a great and mortal *Lethargy*, it hath appeared that it has been after this manner, we may well suspect in a lesser and cureable sleepiness,

neſs, that the out-borders of the Brain, are at leaſt too much watered with humor, and the tracts of the Spirits overflowed; eſpecially if there appear any ſigns of water or of Serum, abounding about other parts of the Head.

A grievous ſleepineſs is wont to be excited, not only from the Serum being too much, or from the over plenty of any other Morbific humor, but ſometimes from its malignity: for it often happens, that a certain infeſtous and virulent matter is inſtilled from the Flood into the Brain, which entering the Pores of the Cortical ſubſtance, profligates the Spirits, and either extinguiſhing them, or driving them away inwards, ſo that this region being left deſtitute of them, a ſleepineſs and forgetfulneſs ſucceeds. There is none almoſt who hath not taken notice, that this often happens in malignant and ill handled Feavours: alſo in the *Scorbutick Cachexie*, the *Yellow Jaundice*, and certain other *Chronical* Diſeaſes, oftentimes a ſluggiſh and vapid or taſtleſs water is ſent in, inſtead of the ſubtil and ſpirituous nervous Juice, that is the parent of forgetfulneſs, and of ſleepineſs. *Not only a plenty of humour, but the malignity, often cauſes this Diſeaſe.*

This Conjunct Cauſe of the *Lethargy*, to wit, the heaping up of too much Humor, or too incongruous, within the ſhelly part of the Brain, depends upon other Cauſes, to wit, more remote leading cauſes, and alſo evident cauſes. As to the former, they are wont to be in fault, both when the Blood ſupplies the diſtemper'd part with Morbific matter, and alſo becauſe that the Brain it ſelf too eaſily admits it. *The procatarctick cauſes of the Lethargy. In what reſpect they are in fault;*

For indeed, the Blood tranſfers to the Head in ſome, a great quantity of a watery humor, and in others of a ſalt or ſcorbutical humor, alſo again in others excrementitious humors, and deadly to the animal government, ſometimes taken from theſe bowels, and ſometimes from thoſe; and as occaſion ſerves, inſtills them together with the nervous Juice, out of the Arteries on the outer borders of the Brain, and there by little and little inſinuating this kind of Morbific Matter, by a long congeſtion, cauſes a dark cloud, or elſe by a ſudden tranſportation of it, overflows at once all the outward part of the Brain, and drives away the inhabiting Spirits, like a Sea breaking in, and compels them to run more inwardly. *Both the Blood begetting evil humours, and ſending them to the Brain;*

But indeed the Morbific Matter, how copiouſly or infeſtous ſoever it be, and poured on the Head, doth not induce the *Lethargic* Diſtemper, unleſs the very weak or vicious conſtitution of the Brain be alſo in fault: for if this be ſtrong and of good temper, it eaſily reſiſts the aſſaults of all thoſe; yea it bears, without hurt, the errors and enormities in the ſix non-naturals. Thoſe who have this part too humid, or too cold, as Children and old Men; alſo, thoſe diſtempered with *Cacochymical* Humors, the *Dropſie*, *Scurvy*, or Humors gathered about the mouth of the Stomach, are very prone to ſleep; and ſometimes fall from a ſtronger Evident Cauſe, into a continual drowſineſs. Beſides, thoſe who have a weak Brain, and their Pores too lax or open, that by that means the feculencies obtruded from the Blood find a more eaſie paſſage, often become obnoxious to ſleepineſs, yea and to the *Lethargy*: for ſuch as are given to Surfeiting and Drunkenneſs, are wont preſently after to fall aſleep, which weakens the tone of the Brain, and fill, and too much open its Pores, with a crude and filthy Juice, ſo that when it hath been for a long time accuſtomed, by reaſon of theſe occaſions, to admit into them the Serous ſuperfluities, it afterwards refuſes nothing brought to it, but that its paſſages, like a courſe or wide ſtrainer, ſuffers all the groſſer particles, both Saline, watery, and earthy, eaſily to paſs thorow them. *and the Brain too eaſily receiving them.* *Upon what occaſions the Brain is prone to the Lethargy.*

Beſides theſe more remote leading cauſes (which become the act of the ſtirred up Morbific) there are more ſtrong Evident Cauſes, for ſo great danger does not hang over the Brain, as that its whole compaſs ſhould be invaded, from every morbid proviſion, nor upon every light occaſion, But there are many and diverſe occaſions, by which the ſleepy aſſaults are ſeen to be incited: the chief of theſe are great Surfeits, Drunkenneſs, eſpecially of Wine, or the Drinking immoderately of Strong-waters, then after ſuch exceſs to lye all night, or ſleep in the open Air: further, an evacuation of the Serum, by otherways, after having been long ſuppreſſed; alſo if Spaw-waters being drunk in a larger quantity, and not again render'd preſently by Urine, threaten a *Lethargy*. And ſo alſo do recrements of other Diſeaſes, either not well or not at all Cured, being tranſlated to the Head; ſo as a continual ſleepineſs often happens after acute Feavours, or ſuch as continue long, and other *Chronical* Diſeaſes, and eſpecially the Headach, Frenſie, *Empyema*, or collection of groſs Humors upon the Lungs and the *Colick*. *The evident cauſes of this Diſeaſe.*

Thus much of the *Lethargy*, whoſe aſſault proceeds from the *Cortex* or ſhelly part of the Brain, being affected; to which ſucceed either an eclipſe or an excluſion of the Spirits there inhabiting, with a ſleepineſs and oblivion. But as non-natural ſleep, ſo ſometimes what is preternatural, begins from the Spirits being firſt dejected; and which is uſual to ſucceed another Cauſe. It is obvious to any one, that this ordinarily *Another conjunct cauſe of the Lethargy conſiſts in the afflicting the Spirits with ſome narcotick.*

ordinarily happens from more ſtrong Opiates, without any previous flood or ſtopping of the cortical part of the Brain: for it is not probable that Narcoticks ſtir up the Humors, and ſend them to the Brain, when it plainly appears, that all the effervescences and flowings of theſe, are allayed by them. But if it ſhould be asked after what manner, and by what means, Opiates cauſe ſleep, and ſometimes a deadly Torpor or ſleepineſs, we ſay; That this Medicine is a certain kind of poiſon, beating down or extinguiſhing the Animal Spirits, by its blaſting; the Blood and ſolid parts in the mean time being almoſt untouch'd: Wherefore, when the Animal Spirits become raging, and as it were ſtruck with madneſs, running hither and thither, and will not be quieted and allayed, Opiates being adminiſter'd, like water flung upon a flame, deſtroy ſome of the outmoſt bands of them, ſo that the reſt being leſſened, and flying inwards, quietly lye down. We have at large diſcourſed of theſe things in a particular Tract, *Of the Operations of Medicines on the Humane Body*: For the preſent we ſhall note (which is to the purpoſe) that *Narcoticks* (or Medicines cauſing reſt) being taken at the mouth, do put forth their powers partly in the Ventricle, and indeed immediately, and partly in the Brain, both that and the Maſs of Blood mediating. By what means *Narcoticks* do operate, whilſt in the Ventricle, and provoke ſleep, we have ſhewn, *Chap. XV.* When they are moderate, in either province, they gently intoxicate ſome unquiet Spirits, and ſo immediately quiet the reſt; but if any one takes Opiates in too large a Doſe, he ſhall preſently feel hurt both in the Ventricle and in the Brain, and a little after being inſenſible, ſhall ſuffer a greater evil in either: to wit, a mighty heavineſs, and as it were an immoveable weight in the Stomach, which ſeems to opreſs both it and the neighbouring parts; indeed by this ſign, the Fibres of this place (the Spirits which before actuated them being broken) become without life, and as it were dead; then by reaſon of the Opiate, particles being carried about with the Blood, to the frame or compaſs of the Brain, and inſtilled into its Cortical or ſhelly part, the Spirits being driven away from thence or extinguiſhed, an irreſiſtable, and oftentimes a deadly ſleep follows: yea, I have ſometimes known, from a more grievous hurt inflicted on the Ventricle, only by the uſe of a more ſtrong *Narcotic*, Death it ſelf to have followed before ſleep could creep upon them, coming by a long way about. A ſtrong man vexed with a moſt cruel *Colick*, for eaſe ſake (whilſt a *Phyſician* was ſent for) took raſhly a great quantity of Opium; a little after he had taken it, he complained of a great burthen oppreſſing, and mightily weighing down the Ventricle: His Friends and the by-ſtanders gave him Cordial waters, Wine, and Strong-waters, but without any eaſe: This oppreſſion creeping wider about the Precordia, raiſed up pains and ſwoonings; but ſtill being awake, and conſtant in mind, he cryed out, that his ſpirits more and more failed him; till about three hours after, complaining that his ſight was gone, he preſently dyed.

How opiates cauſe Sleep.

How they operate in the Ventricle, and by what means in the Brain.

The Hiſtory of one preſently kill'd by taking too large a Doſe of Opium.

But that we may return to the *Lethargy*, as it is a Diſeaſe and not the effects of *Opium*, whence we digreſſed; concerning which we are yet to enquire, whether it may ariſe from a Narcotick Humor begotten in us, as ſome *Chymiſts* aſſert? We ſhall tell you our conjecture, that we think this 'tis ſufficiently plain, that there are other ſorts of Morbific particles produced in our Bodies, than thoſe commonly called Elementary and Humoral, and that they do affect after a various manner, *viz.* beſides the Watery, Earthly, Bilous, Phlegmatick, or Melancholic, we may find others *Vitriolick*, *Nitro-ſulphureous*, and others participating of enormous Sulphurs and Salts, and active to our evil. The Convulſive *Pathology* can by no other means be delivered and explained, unleſs by ſuppoſing that ſome extraneous little bodies, and as it were *Nitro-ſulphureous*, which ſticking to the Spirits, and at laſt caſt off by them, ſtir up the Exploſive, that is Convulſive force: In like manner we may think, that others of another nature may perhaps be begotten, ſuch as are of a *Sulphureous*, *Vitriolick*, or Narcotick nature, which when they creep into the Brain and nervous Stock, fall upon ſome Animal Spirits, which they by chance do meet, with extinguiſhing and fixing them, ordinarily induce their loſſes and eclipſes, ſuch as happen in the *Vertigo*, *Apoplexy*, or *Palſie*, as we ſhall more fully ſhew hereafter. In like manner, in a great fit of the *Lethargy*, though it be improbable, that theſe kind of *Narcotick* particles ſhould be in heaps derived from the Blood into the Brain, in ſo great a quantity, that they ſhould at once overturn the ſpirits dwelling in its whole precincts, and fix them; yet we may believe, that this may be ſome part of the Cauſe. Wherefore, in every long ſleepineſs, or *Lethargick* diſpoſition, we do ſuſpect the Animal Spirits, to be burthened with ſuch a *Lethean Copula*, and that we ſhould direct the darts of every Medicine againſt it.

Sometimes a Lethargy ariſes from Narcotick Particles begotten in the Body;

Even as Convulſions from a nitro-ſulphureous, or exploſive matter.

Thus

Thus much concerning the formal reaſon, ſubject, and cauſes of the *Lethargy*, properly ſo called, the ſumm of all which is, That the Animal Spirits, the inhabitants of the exterior Brain, being hindred from their wonted motion and emanation, lye down in a profound and inextricable ſleep: but they are hindred either by the proper vice of themſelves, becauſe having taken or being diſtemper'd by ſome Narcotick, they are as it were coagulated and become immoveable; or becauſe their exterior tracts or paths in the Brain, are obſtructed and poſſeſſed by ſome ſtrange gueſt, ſo that there is no fit ſpace granted them for their expanſion. *What things belong to the Theory of the Lethargy.*

The ſymptoms of this Diſeaſe, which now come in order to be explained, the chief are Sleep, and forgetfulneſs, or a ceſſation of every other knowing or ſpontaneous function, unequal and ſlow breathing, a Feavour, and oftentimes, the diſtemper growing worſe, Convulſions, a leaping of the Tendons, and at length univerſal and deadly Cramps or Convulſions. *Its ſymptoms.*

As to the too former of theſe, we mentioned before, that Memory is deficient altogether for the ſame reaſon, as Sleep exceeds; to wit, foraſmuch as the Spirits inhabiting the outward part of the Brain, being either bound up or expulſed from their tracts, do not irradiate or beam forth from the Callous Body, into the Cortex or ſhelly part of the Brain, by which imagination or waking is made; nor do they, being carried inwards, and repeating their former footſteps, repreſent the Ideas or Images of things before acted. Indeed, Sleep, Watching, and Memory, are affections of the ſame parts and places: of which it is no light ſign, and which vulgarly appears by experience, that *Opiate* Medicines, by which Sleep is provoked, being often given, hurt the Memory. Yea I my ſelf knew one, having taken a ſtrong *Hypnotick*, or Medicine to cauſe ſleep, after being ſick with a Feavour, lived many nights and days without ſleep, and almoſt wholely loſt his Memory, eſpecially as to any thing long paſt. *The chief of which are, a ſleepineſs, and oblivion.*

As to what reſpects the other faculties of the Corporeal Soul, to wit, the Imagination, Appetite or deſire, Senſe, and Motion, although no *Narcotick* or ſleepy chains are caſt upon the Spirits deſtinated to theſe offices, and that the Pores and paſſages of the interior Brain, within which they are wont to expatiate, are ſeen to be open enough, yet theſe Spirits, becauſe during the fit, they are denied their commerce with the others bound up, of themſelves lye down, and are overcome by Sleep. For as a continual ſleepineſs beginning about the root of the ſenſitive Soul, to wit, the Cortex or ſhelly part of the Brain, immediately its whole province is obſcured, as it were with a veil, to wit, the knowing, deſiring, and ſelf-moving part of the Soul, and alſo the intellect it ſelf, its windows being every where ſhut up, hardly ſpeculates, or beholds any thing. *By what means the other faculties of the Soul, to wit, the knowing, deſiring and locomotive, are affected.*

Further, the power or force of this Diſeaſe, is ſeen to be extended to the other part of the ſenſitive Soul, preſiding o're the Cerebel and its Regiment; wherefore, during the fit of the *Lethargy*, the reſpiration and Pulſe are altered: for that becomes unequal and ſlow, ſometimes drawing the breath deep and long, ſometimes ſhort, repeated, and as it were double: and this being great and ſwift, diffuſeth a feavouriſh heat thorow the whole body. *The evil of the Diſeaſe reaches alſo to the Cerebel.*

The reaſon of the former, if I am not deceived, is this, to wit, that the ſame Morbific Cauſe, which infects the outward part of the Brain, and its inhabitants, infects alſo in part the *Cerebel*, and the Spirits there ſerving for the motions of the *Precordia*; which being by that means diſturbed and hindred, though they omit not thir tasks, yet they perform them difficultly, and with interruption; hence the *Diaphragma* and Muſcles of the *Thorax*, do not ſo eaſily and ſwiftly as before, perform their *Syſtoles*, but laborioufly and with a longer ſtraining or endeavour, and ſometimes with repeated tryals or forces. This kind of unequal, long, and difficult breathing, frequently happens alſo in a Phrenſie; wherefore, ſome judge the cauſe both of this and that, to be from the inflammation of the Midriff or *Diaphragma*, but amiſs, becauſe the *ſymptom* in both theſe *Cephalick* Diſeaſes depends on the *Cerebel*, participating the hurt of the Brain, grievouſly diſtemper'd. *Hence breathing is often hurt, or altered.* *This proceeds not from the Inflammation of the Midriff.*

As to the Feavour of one troubled with a *Lethargy*, to be known by the great and quick Pulſe, hot breathing, with a burning of the Tongue and Mouth, without any heat in the extream parts, ſome deduce this from the ſame cauſe as the *Lethargy*, to wit, either from Phlegm putrefying in the Brain, or from a cold inflammation of the Brain Others on the contrary, affirm the Feavour to be the primary effect, and thence the Morbific Matter to be carried into the Head, from the burning Blood. *From whence the Lethargick Feaver.*

Concerning theſe, we grant, that a *Lethargy* comes often after a Feavour, but we can ſay nothing of the Phlegm putrefying in the Brain, or of its frigid Inflammation, which is as much as to ſay, icy fire; for if this be malignant, or of evil cuſtom, happening *Not from Phlegm putrifying in the Brain.*

pening alſo to Children, old Men, and other Phlegmatick, Scorbutick, or very *Cacochymical* perſons, or ſuch as are full of ill humors, about the height of a Diſeaſe, not well Cured, oftentimes in the place of a *Criſis*, the ſeavouriſh matter being ſnatch'd into the Head, induces a cruel and oftentimes a deadly Torpor or ſleepineſs; which notwithſtanding ought not to be eſteemed the ſymptom of the Diſeaſe, but of that Feavour. After this manner I have often obſerved, and elſewhere have particularly deſcribed, that Soporiferous Feavours, and as it were marked with a certain ſleepineſs, have raged and become *Epidemical*, at ſometimes, by reaſon of the evil conſtitution of the year.

Nor is the former always the cauſe of it in the Lethargy. Lib. de Morb. Convulſ. Cap. viij. p. 96.

But it is no leſs uſual when a *Lethargy* is the principal diſtemper, for a Feavour to follow, and to owe to it as much its original, as its Cure; for a Feavour beginning after a continual ſleepineſs, that being ſhaken off or diſcuſſed, ceaſes ſoon of it ſelf; ſuch a Feavour we think to ariſe, not from the Blood growing hot by reaſon of the ſtrife of inteſtine particles, but becauſe of the impulſe of the containing and neighbouring bodies, variouſly altering and diſturbing its courſe. For indeed the right temper of the Blood very much depends, not only on its particles being truly mixt and overcome, but alſo upon the motion impreſſed on the Heart and the Veſſels, or the Organical Circulation; to wit, that its Liquor may every where flow with an equal and alike flowing and ebbing; which, if finding any where a ſtop or Remora, it be retarded, its motion is made more impetuous, and with a Feavouriſh tumult in the whole channel beſides. This manifeſtly appears in violent paſſions, acute pains, a breaking of the unity, in all which the Blood being obſtructed in one place, or ſtraitned, it is ſnatched more vehemently in others, and conceives a Feavouriſh heat; for this cauſe, to wit, leſt the thread of its circulation ſhould be broken, on which life neceſſarily depends; wherefore as the Proverb ſays, *None dyes without a Feavour*: For how poor or deficient ſoever the Blood is, and that the ſtrength of all the moveing parts are weak, yet in the inſtant agony of Death, by the mere impulſe of Nature, they either purſue their functions, or the nervous Fibres every where erect themſelves, and put forth their utmoſt endeavours, that they might drive forward the Blood flowing in them, and Circulate it with a rapid motion. I once viſited an illuſtrious Lady, who for ſome time had been miſerably afflicted with *Colick* and Convulſive diſtempers, and quite worn out, and at length fell ſuddenly into a deadly *Lethargy*. When I perceived her Pulſe to beat ſtrongly, I preſcribed that four ounces of Blood ſhould be taken out of the jugular Vein, which immediately leap'd from the opened Veſſel, with ſuch force that, I believe, if it had been ſuffered, the whole Maſs of Blood would have flowed thence: for the next day after, her dead body being opened, I found ſcarce four ounces more of Blood in her whole Body, and yet ſhe dyed thus in a Feavour. The reaſon of the *Lethargick* Feavour is wholely the ſame, which is ſeen to ariſe only from the Vital Organs, being very much incited by labouring Nature, and therefore vehemently driving about the Blood.

More often the effect of this Diſeaſe proceeds from the Organical Circulation of the Blood, being hindred or altered.

How none dyes without a Feavour.

The *prognoſtick* of the *Lethargy* is ſhut within a ſtrait limit; for the fit of the Diſeaſe being for the moſt part acute, is ſoon terminated either in Death or health, and for the moſt part it is wont to give more of fear, than of hope. If it comes upon a malignant Feavour or hard to be cured, or if it comes upon other *Cephalick* or Convulſive Diſeaſes, as the Headach, Phrenſie, Madneſs, Epilepſie, or alſo upon a long and grievous Colick, or Gout, the *Phyſician* can predict nothing but evil: nor is it leſs to be feared if it happen in a Body full of evil Humors, or one long ſick, or in an old Man.

The Prognoſtick of the Lethargy. *When the Diſeaſe is deſperate.*

In like manner it is an evil omen, if the ſick, being preſently overwhelmed with a great Torpor or ſtupidneſs, and almoſt *Apoplectick*, cannot be awakened, and if he breaths unequally, and ſlowly, or with a great ſnorting, then the Diſeaſe increaſing, and the ſick troubled with tremblings, Cramps, leapings of the Tendons, and at length with Convulſive Motions, it is to be eſteemed deſperate or without hope.

When it is only ſo.

But if the Diſtemper be excited, without any great foregoing Cauſe, with an only Evident Cauſe, as a Surfeit, Drunkenneſs, or by the uſe of Narcoticks, a blow on the Head, or ſome not deadly ſtroke, we may expect the event to be leſs deadly or mortal.

When ſome hope may be conceived.

Then if the Diſtemper, ariſing from ſuch occaſions, happens to a Body before whole and ſtrong; if it does not wholly take away the Senſe and Memory at the firſt aſſault, and after a ſhort time the *ſymptoms* begin to remit a little, of ſuch a ſick perſon you ought not to deſpair.

From whence more hope may be had.

In every *Lethargy*, if any Cauſe of the Diſeaſe is ſeen to be cut off and removed, ſo that if by the help of Medicines, or the inſtinct of Nature, copious and helpful evacuations by Sweat, Urine, or by Stool do follow, with eaſe or help, or if by ap-

Whence more of hope than of fear.

plying

plying of Bliſtering Plaſters a great deal of water flows forth, if a ſwelling or great whelks or puſtles break out behind the Ears, or in the Neck, if frequent ſneezing happens, or water flow from the Eyes or Noſe, thence a certain hope of health may be expected.

A red Swelling coming upon a Lethargy ſometimes cures it.

Hippocrates l. Coac. c. 145. mentions a Cure of the *Lethargy*, to be often made by the diſtemper of the *Thorax*; ſaying, *That many Lethargicks that are ſtuffed with Phlegm have recovered:* Which words are wonderfully wreſted by Interpreters. *Mercurialis* underſtands by ſuppuration, the putrified matter of the Diſeaſe, to be evacuated by the Ears and Noſtrils. *Proſper Martianus* will have *Hippocrates* to be underſtood in the word *Lethargy*, not the diſeaſe of the Head, but of the Breaſt. But wherefore are all theſe ſubterfuges? when it often happens that the Morbific matter, at firſt fixed in the Head, and ſtirring up a continual ſleepineſs, or *Lethargy*; the ſame being thence ſupped up by the Blood, and depoſited in the breaſt, doth produce an *Empyema*, or a ſpitting like thoſe whoſe Lungs are waſted. In the deſcription of a Soporiferous Epidemical Feavour, which raged in the year 1661. we noted the ſame to have happened to many.

Lib. 9. *of Convulſive Diſeaſes.*

The Cure of the Lethargy.

Concerning the Cure of this Diſeaſe, for that it has no reſpite or truces, it is not to be deliberated on: after a ſharp Clyſter being given, let a Vein be opened preſently, for the Veſſels being emptied of Blood, they are more apt to ſup up the Serum, or other Humors depoſited in the Brain. Further, in this caſe, I adviſe rather to open the Vein in the Neck, than that in the Arm. Becauſe by this means, the Blood being very much heaped up, within the boſoms of the Head, and perhaps ſtanding ſtill, is more eaſily reduced to an equal Circulation.

Phlebotomy almoſt always neceſſary.

Outward Adminiſtrations.

Letting blood being performed, immediately other remedies of every kind are to be made uſe of: Let Veſicatories or bliſtering Plaſters be applied largely to the Neck and Legs; anoint the Temples and Face with Oyl of Amber, or *Cephalick* Balſoms; lay over all the Feet a *Cataplaſm* or Poultis, made of Rue, Crowfoot, and Pepperwort, with black Sope and Bay-ſalt; uſe hard frictions or rubbings to the Members, frequently apply to the Noſtrils Salt of Urine, or Spirits of *Sal Armoniac.*

Internal Remedies.

Then let there be adminiſtred Cephalick Remedies.

Julep.

Take *of the Water of Pœony Flowers, of black Cherries, Rue, and of Walnuts, ſimple, each three ounces; of the Water of Pœony Compound two ounces, of Caſtor tyed up in a rag and hung in the glaſs two drams, of Sugar three drams; mix them and make a Julep, let it be given about four or five ſponfuls every three or four hours; alſo with every Doſe of this, give twelve or fifteen drops of the Spirits of Amber, or of Sal Armoniac, or a paper of the following Powder.*

Spirits.

A Powder.

Take *of the Powder of the Root of Pœony the male, of a Mans Skull, of the Root of Virginian Serpentworth or Snakeweed, of Contrayerva, each one dram; Bezoar, and of Pearl, each half a dram; of Coral prepared one dram, make a Powder, and divide it into twelve parts.*

A Vomit or Purge.

Further, here it is to be conſidered, whether an evacuation, either by Vomit or Stool, ſhould not be made. I know that this is variouſly controverted among Authors, and I have alſo known it performed with various ſucceſs: which being weighed and laid together, I ſhall briefly propoſe my opinion.

How they are indicated.

If the *Lethargy* ſhould ariſe upon a Surfeit, or a late Drinking, or if from taking ſome diſagreeable things, or *Narcoticks*; preſently let a Vomit be given; wherefore, you may give Salt of *Vitriol*, with Wine and *Oxymel* of Squills; or in ſtrong bodies an Infuſion of *Crocus Metallorum*, or of *Mercurius Vitæ*, with black Cherry water. Let it be given, and if it doth not work of it ſelf, provoke Vomiting with a Feather thruſt down the Throat.

When to be avoided.

But if the fit of the Diſeaſe comes upon a Feavour, or any other Cephalick Diſtempers, or if it be raiſed up primarily, or of it ſelf, by reaſon of ſome foregoing cauſe before lying in the Blood or Brain, then a Vomit or Purge being given at the beginning, when the matter is flowing, doth oftentimes more hurt than good; becauſe the Humors whilſt in motion, are more ſhaken and agitated, and when they cannot be ſubdued and brought away, they drive them into the diſtempered part.

Scarification.

On the ſecond day, if the numneſs doth not remit, let Phlebotomy be repeated, if the Pulſe ſhew it fitting; or elſe inſtead thereof, take forth blood from the Shoulders, after Scarification by Cupping Glaſſes; then a little after (if nothing hinders) let a Vomit or Purge be adminiſtred.

Cathartick. Take *of the Sulphur of Antimony five grains, of Scammony ſulphurated eight grains, of the Cream of Tartar ſix grains; mingle them, make a Powder; let it be given in a ſpoonful of the afore preſcribed Julep.*

Or Take *of Scammony ſulphurated twelve grains, of the Cream of Tartar fifteen grains, of Caſtor three grains; make a Powder, and let it be given after the ſame manner. In the mean time, let altering Medicines, or ſuch as derive the matter from the place, the ſame or ſuch like, be ſtill continued.*

Errhines, Sneezing Powders, and Apophlegmatiſms, &c. On the third day, and afterwards ought to be applied ſuch things, which are forbid at the beginning of the Diſeaſe, for fear of a new Fluxion, *viz. Errhines*, or things that Purge the Head at the Noſe, Sneezing Medicines or Powders, *Apophlegmatiſms*, or Medicines which draw the Humors from the head by the mouth. Further, it is then ſometimes expedient to apply the warm intrails of ſome animal new killed, to the forepart of the Head, after the hair is clipped or ſhaven off, and often changed: alſo ſometimes to foment thoſe places with a Diſcuſſing and *Cephalick* Decoction, or Fomentation: but before all other *Topicks*, I have known great help brought from a large *Veſicatory* or Bliſtering, with many running ſores made all over the compaſs of the Head. I ſaw two ſick with the *Lethargy*, after the Diſeaſe held long, and that not only the Memory, but almoſt all knowledge was loſt, Cured chiefly by this Remedy: for in both of them, the fleyed places, when they could not be eaſily covered, poured forth great plenty of thin matter, about half a pint every day. It will not be needful to ſet down any more Medicines of this nature, being commonly and every where to be had; it now remains, that we illuſtrate what we have ſaid, with ſome Hiſtories of ſick people, which I ſhall here add.

A Bliſtering applyed to the Forepart of the Head very much helps.

The firſt Hiſtory. A Country-man about thirty years old, of a Phlegmatick Complexion, ſomething inclining to Sanguine, being a long time obnoxious to frequent Headachies, about the beginning of Winter, became ſleepy and very ſtupid; and one day, whilſt he was following the Plow in the Fields, lying down on the ground, he fell into a profound ſleep, and when he could not be awakened by his ſervant and others calling him, he was carried home and put to bed; his Friends in the mean time expecting that after he had finiſhed his ſleep, he would awake of himſelf. After the ſpace of twelve hours being paſt, when he could not be awakened by pulling, thumping, noiſe, and other means, they ſent for me; as ſoon as I came, I applied Bliſtering Plaſters, large ones, all about the hinder part of the Neck, then taking from him about ſixteen ounces of Blood, I cauſed him to take a ſtrong Clyſter, and his Face and Temples to be anointed with Oyl of Amber, and Frictions and painful Ligatures to be applied to his Legs. Alſo I preſcribed him to take oftentimes in a day, Spirit of Sut, with a *Cephalick* Julep. Notwithſtanding he lay all that day ſtupid, without any ſenſe; and if being provoked by ſome ſtrong or hard pulling, he lifted up himſelf a little, and opened his Eyes, preſently falling down again, and ſhutting them, he fell into his continual ſleep again. About Evening I took care to have Cupping Glaſſes, with a great flame to be applied to his ſhoulders, which done, he began a little to awake; and about that time he had a great ſtool, and very much Serum flowed forth from the Bliſters, the Plaſters being taken off, then we had great hopes of his health. And therefore at every turn, remedies being applied that night; awaking in the morning following he knew his Friends, and anſwered aptly to thoſe who interrogated him: But as yet the whole cloud was not vaniſhed, but that being ſleepy, he remained ſeveral days oblivious, till at length, being purged twice, he perfectly grew well.

The reaſon of this. This caſe has the exact type of the *Lethargy*, properly ſo called, where for the conjunct Cauſe, it had an heaping up of abundance of Serum about the compaſs of the Brain, and then a breaking in of it into its infoldings: and when by a timely uſe of Remedies, the flowing in of new matter was hindered, and that which lay upon the part was partly ſupped up into the Blood, and partly being rarified into Vapours and Effluvia's, was ſhaken off, the Cure of the Diſeaſe quickly and wholely followed.

A ſecond Hiſtory. An *Oxford* Gardiner being ſick of a Feavour, about the height of the Diſeaſe, inſtead of a *Criſis* he fell into a continual Sleep, and lay drowned in it for three or four days, ſo that he could not be awakened by the uſe of any Remedies: But at length, his Head being ſhaven, Bliſtering Plaſters were applied all over his Head, and many running ſores left open, and awakening he recovered the uſe of his ſenſes a little: But his Memory being almoſt wholely loſt, he became ſo ſtupid, that he remembered the name of no Man, nor their words, and remained like a Bruit. When he had thus remained fooliſh for the ſpace of almoſt two months, and ſtill very ſleepy, the

cloud

cloud began a little to be diſpelled: and at length, he returning to his wonted labour, was in indifferent good health; but he never had afterwards the ſame vigor of mind and wit, as he had before this Diſeaſe. In this caſe you have an example of a *Lethargy* coming upon an ill Cured Feavour, in which the Morbific Matter, by a ſudden tranſlation of it into the outward part of the Brain, had for a little while filled, not only all the Pores and paſſages, but alſo had ſo hurt their Conformation, that the Spirits being for ſome time excluded, and at length freed, they could not recover their former paths, or wonted tracts, till of a long time after.

The third Hiſtory.

I remember very well, the example of a *Lethargy*, ariſing from the uſe of Opiates, in a Country Village where I lodged by chance one night, by reaſon of the foulneſs of the weather. For being about to go to bed, mine Hoſt asked me if I would viſit two poor people his Neighbours, diſtemper'd after a wonderful and miſerable manner. When I ſhewed my ſelf ready to do the office, not only out of Charity, but led alſo by curioſity, I was carried willingly into a ſmall and poor Cottage, where I found the Father an old Man, and his Son, both of them in two Beds in one and the ſame Chamber, overwhelmed with a moſt profound Sleep, which had oppreſſed them the day before, after they had eaten ſome roots, which they had dug up in the Garden, being it ſeems Henbane, which they took for Parſnips.

The Cure deſcribed.

After they had both Oyl and *Oxymel* poured down their throats, and a Feather thruſt down a great way, that made them vomit, I preſcribed for them tincture of *Caſtor*, with a ſpoonful of *Treacle*-water (which Remedies I had then about me) to be given them at every turn all night: beſides, that they ſhould anoint their Noſtrils and Temples with the ſame Tincture; and if it might be done, that a ſtrong Clyſter ſhould be given them: the following day the old Man firſt, and afterwards the Son awaking, returned to themſelves, the ſleepineſs being almoſt wholely ſhaken off. In theſe diſtemper'd, after the reliques of the *Narcotick* were caſt out by Vomit, leſt they ſhould do further hurt, there was only need, that by fit Medicines (among which *Caſtor* deſervedly is eſteemed to be contrary to the venom of *Opiates*) the Spirits being excited, ſhould be ſet free from the ſleepy poiſon afflicting them.

CHAP. IV.

Of ſome other ſleepy Diſtempers, viz. *a continual Somnolency, the* Coma, *or heavy Sleeping; and the* Caros, *or a deprivation of the Senſes.*

IN the former Chapter, we have fully ſhown what doth belong to the knowledge, *prognoſtick*, and Cure of the *Lethargy*, properly ſo called. But we did not only therefore affirm, that the ſeat of this Diſeaſe was in the unequal compaſs, the cranklings, or infoldings of the outward part of the Brain, becauſe we had there aſſigned the repoſitory of the Memory, and the porch of Sleep, (although we might from hence conclude it;) but beſides, becauſe it hath appeared ſo to me from *Anatomical* obſervations very often, that the *Lethargy* does not ariſe (as is commonly thought) from the interior Ventricles of the Brain being diſtemper'd: for we have known, theſe to be frequently overflown with water, and ſometimes diſtended with extravaſated Blood, and yet the ſick whilſt they lived, were free from the *Coma*, or any great ſtupidity. I muſt confeſs, that ſometimes the Dropſie of the whole Brain cauſes the continual ſleepineſs: but in this caſe not only the internal Cavity, but alſo the *Interſtitia*, or the ſpaces between the outward Infoldings, are filled with a flood of waters.

Sleepy Diſtaſes do not ariſe by reaſon of the Ventricles of the Brain being filled with water.

The *Lethargy* therefore being confined to the outmoſt borders of the Brain, we ſo conſtitute its limits, that thoſe circlings about, being almoſt wholely poſſeſſed, together with the interſperſed Marrow, perpetual and inexplicable Sleep, or hard to be rid of, with oblivion or forgetfulneſs, is induced; in the mean time, the middle part of the Brain, or the *Callous* body, from whence the Animal Spirits irradiate, or beam forth, into all parts both ſenſible and motional, being almoſt unhurt; for the total eclipſe of this cauſes the *Apoplexy*, as ſhall be ſhewed hereafter. But indeed on either ſides of theſe ends or limits, other ſoporiferous diſtempers are ordinarily found, which though of kin to the *Lethargy*, yet ſome of them are leſſer than it, as *Somnolency* or continual ſleeping, and the *Coma*; only one is greater, as the *Caros*. Therefore

The ends or limits of the Lthargy, as to the places diſtempered, are conſtituted.

Some ſleepy Diſtempers leſſer than that, viz. *Sleepineſs, and the Coma: The Caros is greater than it.*

fore we ſhall now, and in order, ſpeak briefly of every one of theſe, as alſo of ſome oppoſite paſſions, *viz.* thorow waking, and the waking *Coma*: and firſt of Continual Sleepineſs.

Continual Sleepineſs deſcribed. Moſt Authors call this not a Diſeaſe, but an evil habit, or a ſleepy diſpoſition, for the diſtemper'd, as to other things, are well enough; they eat and drink well, go abroad, take care well enough of their domeſtick affairs, yet whilſt talking, or walking, or eating, yea their mouths being full of meat, they ſhall nod, and unleſs rouzed up by others, fall faſt aſleep: and thus they ſleep continually almoſt, not only ſome days or months, but (as it is ſaid of *Epemenides*) many years; wherefore we ought to believe this a Diſeaſe, and worthy of Cure, which defrauds one of more than half his life.

Its Seat aſſigned. The ſeat of *ſleepineſs*, as that of the *Lethargy*, is to be placed in the outward part of the Brain; but with this difference; that the material or conjunct Cauſe of this Diſtemper, though it vexes, or troubles always without doors, yet it penetrates leſs deeply than the *Lethargy*; yea it diſturbs or affects almoſt the whole ſuperficies of the Brain, or the mere *Cortical* ſubſtances of the infoldings, the included marrow being almoſt untouch'd: in which reſpect, it differs not only from the *Lethargy*, but the *Coma* alſo; for in the Diſtempers which we deſcribed, though continual ſleep preſſes on them, yet 'tis eaſily broken off; then beſides, being fully awakened they remember many things, and converſe with their Friends, though immediately prone again to ſleep: whence it appears, that the cauſe of this Diſeaſe ſticks only in the outer border of the Brain, nor does it enter deep into its compaſs, as other ſleepy diſtempers do.

In what reſpect it differs both from the Lethargy and the Coma.

The conjunct cauſe of Sleepineſs. But indeed it may be ſuſpected, that while the Blood every where waſhing the border of the Brain, with thick rivulets, and inſtils every where into it a ſubtil water, for the matter of Spirits, oftentimes a great plenty of water flowing thither with it, and entering together the *Cortex*, and remaining there, mightily fills it, and (like an *Anaſarca* in the Body) ſwells it up: But this *Cortical* or ſhelly part being ſwelled up after this manner, and as it were dropical, ſo preſſes the Medullary infoldings, every where lying under it, that the expanſion of the Spirits being hindred, by reaſon of the Pores of the exterior part of the Brain being ſomething bound up, ſleepineſs is induced; to which it happens, that the Blood, that by reaſon of the *Cortex* of the Brain being intumefied with water, as it were between the Skin, Circulates leſs expeditiouſly, thorow all the neighbouring parts, and ſo is apt to fill the Veſſels and boſoms, and to ſtagnate in them; by which means it comes to paſs, that the exterior border is yet more compreſſed, and ſo the ſpaces requiſite for the emanation of the Spirits, are alſo more ſtreightned. Indeed this appears to be part of the cauſe, from hence, becauſe this kind of ſleepineſs, by reaſon of the Blood not freely circulating in the Head, and therefore apt to ſtagnate, is wont to make red the Face, with a certain blueneſs and blackneſs: Further, whilſt the ſubtil Liquor, which is for the matter of Spirits, paſſing thorow this pond or deluge heaped together in the *Cortex* of the Brain, goes forward into the Marrow lying under, it is probable, that with it do creep thorow ſome extraneous, and as it were very ſmall *Narcotick* particles, which growing to the Spirits immediately render them torpid or ſtupid, and prone to ſloth of their own accord.

What the deluge or Anaſarca of the Cortical part of the Brain is.

To which happen an heaping up, or as it were a ſtagnation of the Blood, about the compaſs of the Brain.

Alſo a Torpor or Sleepineſs of the Spirits.

This Diſtemper, as I have obſerved in many, is not very dangerous, for as it often happens, it is wholely Cured, or at leaſt remaining for many years, without the *Carus* or *Apoplexy* (which is wont to be feared) it doth not become mortal or terrible. The Cure of this Diſeaſe often happens, the ſeat of it being changed, to wit, when clearing the Brain, the Morbific Matter is transferred to the *Cerebel*, which coming thither, produces tremblings of the Heart, the *Aſthma*, loſs of Spirits, and other troubleſome *Symptoms*, commonly taken for *Hypochondriacal*,

The Cure of Somnolency. The Curatory Method ſuggeſts chiefly theſe intentions, to wit, that after a proviſion or foreſight of the whole, that (where it is convenient) Phlebotomy be performed, and a Purge given; then thoſe Remedies to be diligently adminiſtred, by which the Blood and the Brain may be freed from the watery deluge, and this latter may be ſtrengthened, whereby it may for the future receive and retain the Serous ſuperfluities. For thoſe ends, once or twice a week, may be given Pills of Amber, or of *Cochiæ*, with the Reſine of *Jalap*; at other times, let there be taken daily Morning and Evening, a Doſe of a *Cephalick Electuary*, or Spirits of Tincture of *Sal Armoniack*, Amber, Sut, with a *Cephalick* Julep: the forms of which may be picked out of thoſe above deſcribed. At eight of the Clock in the Morning, and at five in the Afternoon, let them drink a draught of *Coffee*, or the Liquor prepared of that Berry, firſt boiling in it, the leaves of *Sage* or *Roſemary*, till it has got a greeniſh

greeniſh Tincture. Let them drink for their ordinary drink, a Decoction of *Lignum Sanctum*, adding towards the end, the leaves of *Sage* or *Betony*, or other *Cephalicks*. Further, it is expedient that two large Iſſues be made between the Shoulders, and alſo frequent Bliſtering Plaſters be applied about the Neck. The hair being cut off, let a quilted thing of *Cephalicks* and Spices be worn under the Cap. Let them alſo hold their noiſe often over a Veſſel fill'd with Salt of Urine, or the Spirit of *Sal Armoniack*; let care be taken that they keep to an exact order of diet, and that thoſe attending the ſick, do not only rouſe them from ſleep, but daily at ſome ſet hours keep them waking.

A certain Gentleman of a Sanguine Complexion, and when he was young, of a ſharp and cunning wit, but afterwards growing aged, being given to idleneſs and drunkenneſs, became dull and ſtupid, and alſo Dropſical, with a great paunch, and his thighs and legs ſwelled. Yet from theſe Diſeaſes (which he frequently fell into) when he abſtained at any time from drinking, and took Phyſick, he oftentimes quickly grew well. But at length, though he was freed from the Dropſie, he was oppreſſed with ſo heavy a ſleepineſs, and that almoſt perpetually, that in what place ſoever he was, or what ever he was doing he would ſleep; then being awakened by his Servants or Friends, his mind appeared well enough, and for a few minutes he would diſcourſe of any thing well enough, then immediately fall again to ſleep. To this man I preſcribed, after he had taken in vain ſeveral Medicines, that every Morning and Evening he ſhould take of the Powder of the Leaves of Betony dryed in the Sun, and kept in a Glaſs, a ſpoonful in a draught of the diſtilled water of Lavender Flowers. By which Remedy finding eaſe, after a few days, he was perfectly Cured within a month, and enjoyed perfect health for four years after: Afterwards by reaſon of his evil manner of living, the ſame returned again, but the ſame Remedy found not the ſame ſucceſs; yea there was need of other Medicines beſides; ſometimes he took the Spirits of Harts-horn, or of Sut, with an appropriate Julep; ſometimes *Cephalick* Conſerves and Powders, to which ſometimes Steel was added. When he would indulge himſelf by Drinking, inſtead of Wine or Beer, he drunk Coffee; but for his ordinary drink, he had ſometimes Ale, with the leaves of Scurvigraſs, Sage, and Spices infuſed in it; and ſometimes with Woods, Spices, and *Cephalick* Herbs boiled with it: He lived thus for many years after, almoſt always intemperate, and full of groſs humors, yet free from the *Lethargy*; at length a *Cachexy* or evil ſtate of Body invading him, and waſting with a Cough and *Aſthma*, by degrees, he dyed.

An Hiſtory.

The Cure of the Sick deſcribed.

The next ſleepy Diſtemper before ſpoken of, greater than this laſt, and yet leſſer than the *Lethargy*, is that which is commonly called the ſleepy *Coma*. Thoſe troubled with this, are for the moſt part oppreſſed with an heavy ſleep, which they almoſt ſtill indulge, and lye with their mouth gaping, and their lower Jaw fallen down, more like dead than living perſons; being rouzed up by ſome ſtrong pulling or pinching, they look about, ſpeak to thoſe ſtanding by, anſwer their queſtions, but immediately ſleeping again, they are much troubled to be hinderd or diſturbed from ſleep ſo pleaſingly creeping on them. And thus indiſpoſed after this manner, they continue for many days, yea ſometimes months, ſleeping without any Feavour accompanying, or following it, nor have their breathing hurt, and not very forgetful, in which it differs from the *Lethargy*: Again, they differ from thoſe ſick of the Diſtemper but now deſcribed no leſs; becauſe, thoſe ſick of this *Coma*, are for the moſt part fixed to their Bed or Chair, and walk not abroad as the others, nor take any care of their houſhould affairs. They anſwer to any ſhort queſtions properly, but they cannot diſcourſe, or deliberate about doing any buſineſs.

The ſleepy Coma.

Without doubt, the Cauſe of this is of the ſame nature as the former, but of a middle degree between thoſe two but now deſcribed; for indeed, it may be well ſuſpected in this Diſtemper, that the Morbific Matter doth penetrate the Brain a little larger than in a Continual Sleepineſs: to wit, the turning cranklings, or Cortical infoldings, together with the ſmall Rivulets of the included Marrow are invaded: But yet they reach not to the greater boſoms of the Marrow, within the Callous Body, that are wont to be poſſeſſed in the *Lethargy*.

The reaſon of it.

The *Coma* ſometimes beginning firſt and of it ſelf, like the *Lethargy*, proceeds either from a Serous deluge poured forth from the Blood into the *Cortex* of the Brain; or elſe from a *Narcoſis*, or a ſleepy ſtupidneſs inflicted on the ſpirits dwelling there; and then, by how much this Diſtemper is leſſer than the *Lethargy*, by ſo much it is eſteemed leſs dangerous. But this Diſeaſe more frequently comes upon other Chronical or acute Diſeaſes, to wit, the Headach, Convulſions, and frequently ill-judged Feavours, eſpecially in Children, old Men and Women, and Phlegmatick people. Some time ſince, I obſerved in the Epidemical Feavour of the Nerves, (which I have elſe-

The Coma is either a primary Diſeaſe, or it comes after other Diſtempers.

where

where deſcribed) as ſome were *Lethargical*, ſo many were troubled with this Sleepy *Coma*; of whom many grew well, the Morbific matter being tranſlated from the Head into the Breaſt. Further, in other caſes, this Diſtemper of a doubtful event, between hope and fear, requires the careful pains of a prudent Phyſician.

The Cure of it when it is a Diſeaſe of it ſelf.

In the primary *Coma*, the Curatory Method ſuggeſts almoſt the ſame intentions of healing as in the *Lethargy*: as to the Morbific Matter, indeavour muſt be had, both that a new flowing into the Brain may be prevented; and alſo that what is already impacted, may be diſcuſſed or taken away. Further, the Animal Spirits ought to be rouzed up, or excited, and all ſleepineſs or ſtupidity ſhaken from them. For this end, ought to be applied Purging, Blood-letting, Cupping-glaſſes, Bliſtering Plaſters, repelling and diſcuſſing Topicks, and *Cephalick* Medicines to be given, and chiefly ſuch as are impregnated with a Volatile Salt, and many other means of adminiſtrations already recited.

The Cure of the Coma as it is the ſymptom of another Diſeaſe.

But if this Diſeaſe coming upon other Diſtempers, happens to a perſon, whoſe Body is already much worn out, the Blood vitiated, or greatly depauperated, you muſt ſeriouſly deliberate before taking away of Blood, or Purging: yea, alſo abſtain very much from them. Yet ſometimes that the Conjunct Cauſe, or matter of the Diſeaſe impacted in the Brain, may be put into motion, it may be expedient, to take away Blood moderately, either from the Forehead or Temples, by Leeches, or from between the Shoulders by Cupping-glaſſes and Scarification. Here Bliſtering Plaſters are in chief eſteem, to be applied not only to the hinder part of the Neck, or Head, but to the Legs and Arms, and other parts of the body, by turns. Further, let there be given frequently the Spirits of Harts-horn, of Sut, of *Sal Armoniack*, Amber, or a Mans Scull, Coral, and others, impregnated with other *Cephalicks*, with a *Julep*, or any other proper Liquor. The forms or Receipts of theſe, and of other Remedies, uſed in theſe caſes, together with the Hiſtories of the ſick, and examples of Cures, are extant in the deſcription of the aforeſaid ſoporiferous Feavor; ſo that there is no need to inculcate here again, the ſame, or ſuch like.

In Lib. *Of Convulſive Diſeaſes Chap.* viij.

3. *Of the Caros.*

There yet remains an other ſleepy Diſtemper, or kind of Lethargy or continual ſleeping, commonly called *Carus*, which is greater than the *Lethargy*, and ſomewhat leſſer than the *Apoplexy*, and is ſo near akin to this, that it often paſſes into it; but yet it is wont to be differenced from either: For thoſe ſick with the *Carus*, breath well for the moſt part, and when they are ſtrongly pulled, they move their Members, ſometimes lift themſelves up, open their Eyes, and often ſpeak, which *Apoplectical* perſons do not; yet the ſame, though excited or moved, do ſcarcely underſtand any thing, or plainly diſcern, in which reſpect they are diſtinguiſhed from ſuch as have the *Lethargy*.

How it differs from the Lethargy and the Apoplexy.

The Seat of the Caros is a little deeper in the Brain than that of the Lethargy.

From theſe it appears, that the Conjunct Cauſe of the *Carus*, doth penetrate deeper towards the middle part of the Brain, and hath its ſeat in the outmoſt border at leaſt of the *Callous* Body; wherefore the Animal Spirits, being reſtrained from their wonted expanſion, within this *Emporium*, the acts of the Imagination and Memory ceaſe, and although the Species being impreſſed from a more ſtrong ſenſible, is directed inwards, and oftentimes the local motion is retorted to it, yet becauſe this impreſſion reaches not to the *Callous* Body, by reaſon the Spirits are there amazed or ſtupefied, the ſick know nothing what they feel or do.

Its Conjunct Cauſe.

The Conjunct Cauſe of this Diſeaſe therefore, is very often the ſame, but ſomewhat more ſtrong, than that of the *Somnolency*, *Coma*, and *Lethargy*: The Morbific Matter is ſeen to poſſeſs both the *Cortex* of the Brain, and the Marrow lying under, and being carried forward, ſome greater boſoms of the middle part, and the upper borders of the *Callous* body; yea ſometimes, as this matter is partly carried forward by degrees, theſe Diſeaſes ariſe, and every next is but the augmentation of the former.

The Caros is either a primary Diſeaſe, or it cometh upon other Diſtempers.

But ſometimes the Morbific Cauſe, without any gradual progreſs thorow theſe parts, affects the middle part of the Brain at the firſt aſſault, and there (as it is more lightly or more deeply placed) cauſes the *Carus* or the *Apoplexy*. In which caſe, it is not to be thought, that the whole compaſs of the Callous Body, like the Cortical part of the Brain, ſhould be poſſeſſed by the ſoporiferous matter: becauſe it is ſufficient, this matter ruſhing into any one place, and invading ſome part of the middle Marrow, that preſently for that reaſon, an Eclipſe, or at leaſt a beating down of the Spirits follows, in all that region. After this manner it is wont to be, when the *Carus* comes upon a malignant or ill handled Feavour, or upon the Headach, or ſome Convulſive Diſtempers, or when it is excited by a blow on the Head, or by a fall, or by reaſon of an Impoſthum broken in the *Meninges*: for by reaſon of theſe accidents, the interior Marrow of the Brain is wont to be ſo preſſed together, ſhaken,

or

or otherways altered, that presently the tracts or paths of the Spirits are obliterated or blotted out.

The prognostick of the *Carus* for the most part is but evil, especially if this Disease comes upon a malignant, or a long continued, a gentle and not Cured Feavour, or on a Woman in Childbed, no less danger is also threatned, if it follows after other *Cephalick* Diseases, or is excited by reason of a Wound in the Head: but yet in these cases, all hope of Cure is not presently to be cast off; for I my self have observed, some sick after this manner, and esteemed desperate or past all hope, to have recovered. *The Prognostick of the Carus.*

The event of this Disease is wont to be various, either in Death or in health. The *Carus* passes not rarely into a soon killing Apoplexy, that after first the animadvertive faculty being lost, with a short breathing, and without motion, then by reason of the evil being transmitted to the Cerebel, there follow alterations of breathing and the Pulse, and quickly death it self. *The event of this Disease is various, sometimes it passes into an Apoplexy:*

But sometimes the Morbific Matter setling more deeply, and falling from the *Callous* Body, into the streaked Body, one or both together, the Brain clears up a little, so that the sick look about them, talk, and know things, yet in the whole body besides, a Palsie, or Dead-Palsie on one side follows: but so, that life is not out of danger: for oftentimes, when the Brain begins to be restored, the *Cerebel* grows worse, that for that cause the Spirits there being evilly disposed or affected, which perform the offices of the vital function, and merely natural, either Convulsions are stirred up in the Bowels, and Precordia, or deadly impediments of the Pulse and respiration; yet sometimes when the Morbific matter is not so plentiful, nor very malignant, it is partly supped up into the Blood, and partly shook off, so that the sick grow perfectly well again. *Sometimes into the Palsie.*

The Curatory Method suggests the same intentions of Healing, and requires wholly the same Remedies, as those which are wont to be administred in the *Lethargy* and the *Apoplexy*. Wherefore, there will be no need to add here a company of Indications, nor to heap together a great pile of Medicines: But what seems more to the purpose, that I give you one or two Histories of sick people, of which I have many by me. *Its Cure is the same with the Lethargy and the Apoplexy.*

A known person of about forty years of Age, who having through Intempernace lost his health, took I know not what Medicines, prescribed by an *Emperick*, and fell into the *Carus*; perchance it was because the Morbific Matter being moved and agitated by the Medicine, it rushed into the Head. Visiting this Man on the second day, I found him buried in a profound sleep, and almost insensible; for although he opened his Eyes, moved his Members, when prick'd or strongly pull'd, yet presently sleeping again, he perceived nothing of what he did or suffer'd. Though in this case, I could prognosticate nothing but what was sad, however I did not desist from giving him my Medicinal help: abstaining from letting of blood, his strength being worn out, and his Blood depauperated, I took care for a large Blistering Plaster to be applied to the hinder part of the Neck, and a strong Clyster as soon as I could, to be given him, made of a Decoction of *Briony* Roots, with *Carminative* Flowers and Seeds, adding thereto of the Species of *Hiera* two drams: his Nose and Temples were anointed with Balsoms. *Cataplasms* of Rue, and the Roots of *Bryony* were laid all over his Feet. Besides, every other, or every third hour, I order'd him to drink a Dose of the Spirits of Harts-horn, with a *Cephalick Julep*; yea, and I took care to have administred several other administrations, used in this case. By which, when the Disease did not wholly give place on the following day, I prescribed a Purge of prepared *Scammony* to be taken in a spoonful of Broth; by which, when he had gone often and plentifully to Stool, he began to open his Eyes, speak to, and to know those standing about him, and a little after returning to himself, he fully awaked. This Disease therefore (as I think) was easily and quickly Cured beyond hope, because that cloud, being by chance sent into the Brain by Physick, might the better be deduced thence by the help of other Physick. *The first History.*

A noble person about fifty, fat in body, and in time past obnoxious to the *Vertigo*, and to *Asthmatical* Distempers, using for two years Physick every spring and fall, having also a large Issue between his shoulders, lived in indifferent health: The Summer coming on, and he living in the Country, neglected his Issue for several weeks, so that the recrements there, flowed much less than they were wont; yet he was still well, till about the *Solstice* (or middle of *June*) when one morning chearfully talking with his Friends, sitting in the Porch of his House, rising suddenly he complained, that he was not well; and going into the House, sitting down in a Chair, immediately leaning backward, fell into a profound sleep, and lay so buried in it, that all that *Another History.*

day he could not be awakened. Coming to him in the Evening, I took care to have *Phlebotomy* administred, and also a *Clyster*, a *Vesicatory*, and many other Remedies, proper in such a Case. On the next day, his Brain began a little to grow clear, so that he looked about him, and spake a few words; he seem'd to know his Friends, but could not utter the name of any; but by reason of this matter sinking down more deeply into the Brain, a Palsie seized his whole right side. Further, when as yet his great sleepiness continued, that day Blood was taken out of the other Arm, and also other Remedies as the former, were continued: On the third day, being less stupid, he knew many, and could tell the names of some of them, he perceived then his own sickness, and began to be careful for the taking of Remedis. But indeed, whilst his Brain grew better, the evil spread it self on the *Cerebel*, and the nervous Stock; for on the fourth day, his breathing became unequal, and more laborious, his Pulse weaker, and his whole body troubled with a stifness, and Convulsive shakings: On the fifty day, more cruel Convulsions and Cramps did more often infest him; then his Pulse by degrees lessening, on the sixth day, though more freed from his sleeping, he dyed. In this case, and in others like it, 'tis probable that the Morbific matter did at once invade the Brain and the *Cerebel*, but whilst it stuck in the *Cortex* of this latter (contrary to what happens in the Brain) it caused no sensible hurt, because this part, which was hurt, was neither the seat of Sleep nor of the Memory; but afterwards, perhaps on the fourth or fifth day, the matter sinking down from thence, to the middle parts of the *Cerebel*, whilst as to the other Distemper the sick grew better, the vital function, by reason of the spirits destinated to it being oppressed in their fountain, began to faint, and afterwards suddenly declining, took away unexpectedly all hope of recovery, which before seemed favourable.

CHAP. V.

Of thorow or long Waking, and of the Waking Coma.

EVEN as Light and Darkness, so Sleep and Waking, being placed nigh together, best illustrate the natures of one another; so that it will be to the purpose, after the Sleepy Distempers, to discourse here of preternatural Watching, or Waking; to wit, forasmuch as it exceeding its limits, and hurting some functions, is both a Disease, and requires Cure. In this rank there are commonly two Distempers, to wit, thorow or long Waking, and the Waking Coma; of both which we will now speak in order.

Long Waking is either the symptom of other Diseases, or else is a Disease of it self.

Concerning thorow Waking, we must here first distinguish, to wit, that it is a symptom coming upon some other Disease, as a Feavour, Phrensie, Madness, the Colick, Gout, or such like; then the Cure and consideration of it belongs to that distemper, whose issue it is: or else immoderate Waking, arising of it self, without any notable sickness, is seen to be a Disease almost solitary or alone of it self. So I have known some, free from any Feavour or pain, well in their Stomach, and fit enough for their business, being in Bed, could take no more Sleep than the Dragon of the *Hesperides*. Some troubled with this kind of Waking, though destitute of Sleep, scarce seem to want it it; for their Spirits appear neither sluggish, or weary, or exhausted: but others hardly bearing watching, become from thence languishing, and without Appetite, and are forced to fly to *Opiates*, which sometimes they use daily, and in a large Dose unhurt.

The cause of natural Waking consists in the restlessness of the Spirits, and the openness of the Cortical part of the Brain.

We have before hinted, that the Cause of Natural Waking, which is interlaced with Sleep, consists in these two things, either in one of them, or both together; to wit, first that the Animal Spirits being sufficiently refreshed, and freed from the flocks of the nervous Liquor, do come forth lively, and are on every side streamed forth, and chiefly from the middle part of the Brain into its circumference; then secondly, although they obtain every where an open space, and especially in the exterior compass of the Brain, then freed from the incursions of the nervous Juice, yet lest this expansion of Spirits (which is waking) should be protracted to their loss, longer than is fit, the Spirits by it being wearied, become faint, and as it were lye down of their own accord, and at the same time, the nervous Liquor being poured into the *Cortex* of the Brain, stops or shuts up their passages. Hence it follows, that preternatural

ternatural Waking, or that which is immoderate depends upon these two, either on one or both together; for either they being grown too outragious, and as it were struck with a fury, will not lye down of themselves, or the nervous Liquor doth not so fill and stop up the Pores of the outward part of the Brain, that from thence the Spirits may be compelled inward to rest: Examples of both of these are ordinarily to be met withal.

In like manner also preternatural watching depends upon one or both.

And first of all we shall take notice, that the Animal Spirits, sometimes becoming outrageous and so *Elastick* or shooting forth, or otherways enormous, that they will not only not lye down and be quieted, but scarce be contained within the proper sphere of their emanation; wherefore, being spread abroad in continual waking, so fill the Brain, and keep it extended, that the nervous Juice though it lyes heaped up at their doors, cannot be admitted; but if it enters of it self, and the Spirits are called back inwards, from the Cortex of the Brain, presently they being forced thither, or tumultuating within the middle part of the Brain, raise up many, and often most horrid phantasies, whereby sleep is driven away; or directing thence their declination further, into the nervous Stock, there stir up great disorders, which continually drive away, and break off Sleep, though it seems ready to creep upon them.

The former means described, by shewing how many ways the unquiet or elastick Spirits stir up long waking.

As to the former of these, I have often observed, that some being disturbed with waking, were afraid to sleep, though desiredly coming upon them; for as soon as they shut their eyes to sleep, presently leaping up, they would cry out they should grow mad, with a multitude of confused phantasms, so that they were necessitated to abstain from sleep.

First, Because being recalled for Sleep into the middle part of the Brain, they grow tumultuous.

Secondly, whilst the Spirits become more outrageous, and are for sleep sake recalled towards the interior compass of the Brain, sometimes they convert their rage into the nervous Stock, and then tumultuarily rushing in upon the Nerves, destinated for the Precordia, or the Inwards, raise up inordinations in the respective parts: hence in those thus distemper'd, as often as they shut their eyes to invite sleep, either tremblings, leapings, and binding up of the heart, with loss of Spirits, and breathing stopped, or inflations, and rising up of the Bowels, with a sense of choaking, and other symptoms commonly called or taken to be *Hysterical*, follow: or else secondly, the Spirits being recalled from their watches, and turning on the nervous Stock, transfer their rage sometimes on the spinal Marrow, and the Nerves reaching from thence into all the exterior Members: Wherefore, in some, whilst they would indulge sleep, in their beds, immediately follow leapings up of the Tendons, in their Arms and Legs, with Cramps, and such unquietness and flying about of their members, that the sick can no more sleep, than those on the Rack. Once I was consulted with for a noble Woman, who was in the day-time cruelly tormented with the pain about the heart, and Vomiting, but in the night she was hindred from sleep, though it seemed to approach, by reason of these kind of Convulsive Distempers invading her, with it; nor indeed could she sleep all the night, unless she had before taken a large Dose of *Laudanum*; wherefore, this Medicine at first being permitted her, only twice a week, afterwards she took it daily for three whole months, contracting by it no hurt, either in her Brain, or about any other function; and when in the mean time, by the use of other Remedies, the *Dyscrasies* of the Blood and the nervous Juice were amended, and the Animal Spirits were made more benign and gentle, she having after that wholly left off her Opium, could sleep indifferently well. These kind of sleep-destroying Distempers, stirred up either within the middle part of the Brain, or within the nervous Stock, either more inward or more outward, do depend wholly on the evil constitution of the Animal Spirits: for those who ought to be gentle, clear, and bright, and to actuate gently the containing bodies, and to influence them with a benign influence, become sharp and fierce, and like Effluvia's sent from *Stygian* Waters, unable to be restrained, do distend them too much, and refuse to be governed by the command of the will, and to be quieted by sleep; yea being restrained in one place, they immediately grow tumultuous in another. Such a constitution of the Animal Spirits proceeds from the acid, and oftentimes as it were Vitriolick Dyscrasies of the Blood begetting it, and of the nervous Juice cherishing and increasing it: as shall be more fully shewed hereafter, when we speak of madness.

Secondly, Because being called back into the nervous Stock, they impetuously leap forth.

And so, either into the interior Nerves, serving the Præcordia and Viscera;

Or, into the Spinal Marrow, and the exterior Nerves.

The causes of the aforesaid Distempers assigned.

In the mean time, as to what belongs to the Cure of thorow or long waking, (which we but now described) because it cannot be long tolerated, therefore those things, which may bring present ease, ought first to be administred; for this end, those things which sooth the Spirits, and gently moderate their disorders, are convenient, as those commonly called *Anodynes*, *viz.* Distilled Waters, Decoctions, Syrups, and Conserves of the Flowers of Water-Lilies, Cowslips, Mallows, Violets, Hearts-ease,

The Cure of them declared.

Hearts-eaſe, of the leaves of Willow, Lettice, Purſlain, alſo Emulſions, or Juicy expreſſions. If that the unquiet Spirits will not be allayed by gentle flatteries, you muſt compel them into quietneſs, as it were with bouds and ſtrokes: plenty of them ought to be diminiſhed, and the places alſo to be inlarged, in which they may expand themſelves in freedom, and without tumult, and quitted from the intanglements of other Humors, to wit, of the Blood and Serum: For which ends, ſometimes the opening of a Vein is convenient, and Bliſterings are always to be made uſe of; alſo *Diacodium*, and *Laudanum*, if it be convenient, are frequently given; and in the mean time, whilſt that *Opiates* give ſome truce to the Diſeaſe, the cauſe of it ought carefully to be rooted out by the uſe of other Remedies, as much as may be; wherefore, ſuch as take away the ſharpneſs of the Blood and nervous Juice, and render a ſweetneſs to them, are to be adminiſtred, day after day, in Phyſical hours: In which rank are ſhelly Powders, *Apozems*, and Diſtilled Waters; Alterers, made out of temperate Antiſcorbuticks; the more gentle prepared *Chalybeats*, Spirits of Harts-horn, and of Sut, and almoſt before all other things, the Tincture of *Antimony* is much eſteemed.

The ſecond ſort of thorow or long waking, ariſing both from the too much openneſs of the Brain, and from the unquietneſs of the Spirits;

There remains another ſort of thorow or long Waking, the cauſe of which in ſome, if not in the greateſt part, conſiſts in almoſt a continual openneſs, or too much gaping of the Pores, or paſſages in the *Cortex* of the Brain: For beſides, that the Animal Spirits becoming ſharp, and ſomewhat outragious, refuſe to lye down of their own accord, and to indulge reſt; moreover, no ſtop or yoke is impoſed upon them from the nervous Liquor, entring into the Pores of the Brain, but being free and quitted of all burthens, they are alſo expanded within the exterior ſpaces of the Brain, every where open: wherefore, for this cauſe, thoſe troubled with long Waking, feel no ſleepineſs or heavineſs in the fore part of their head, no deſire or approach of Sleep. I have known ſome diſtemper'd after this manner, who, when they had liveld for many nights continually without Sleep, ſeemed ſtill chearful, active, ſtrong in their ſtomach, and ready for buſineſs, and not to want Sleep. The cauſe of this without doubt is, becauſe the burnt and melancholy Blood, ſupplies the exterior part of the Brain with a nervous Juice, that is not ſoft and favourable, but too much parched, and ſtuffed with aduſt particles, which, for that reaſon, is apt neither to ſtay long within the Pores of the Brain, nor gently to embrace and hold the Animal Spirits. Further, the Spirits themſelves, procreated out of it, become of their own nature too *Elaſtick*, and unquiet, ſo that they are not eaſily ſetled, or are prone of their own accord to Sleep: But theſe more fixed, do not readily fly away, nor being wearied, do ſuddenly grow faint, but indure for a long time, without any great refection, and yet remain lively. Concerning this waking diſpoſition of the Animal Spirits, as it is the ſame in *Melancholicks*, we ſhall have an opportunity of ſpeaking of it more largely hereafter. We may alſo here take notice, that for the ſame reaſon (to wit, that the aduſt Particles of the Melancholick and torrid Blood, being poured into the Brain, together with the nervous Juice, cauſes waking) the drinking of *Coffee* alſo, (in uſe formerly among the *Arabians* and *Turks*) which is drunk by our Country Men, either Phyſically or out of wantonneſs, all ſleepineſs being driven away, doth produce unwonted waking, and an unwearied exerciſe of the Animal faculty; that ſome having a neceſſity to ſtudy late in the night, or preſently after drinking, or a full meal, by drinking a due quantity of this Liquor become ſtill waking, and perform any hard task of the mind, without ſleepineſs. Surely the cauſe of this is, becauſe this drink inſinuates aduſt particles (of which it is full, as may be perceived both by the ſmell and taſte) immediately into the Blood, and then into the nervous Juice; which ſtill detain the pores of the Brain open, by their agility and inquietude, and add to the Spirits, all ſleepineſs being ſhaken off, certain provocatives, and madneſs, by which they are excited to a longer performance of their offices. Further, we ſhall deliver afterwards, where we ſpeak of Melancholy, thoſe things which belong to the preventive Cure of this long waking, or the removing of the Morbific cauſe: In the mean time, for the taking away immediately this *ſymptom*, as often as it is grievouſly troubleſome, we noted that *Opiates* were little profitable; for a bare Doſe being given, doth rarely cauſe ſleep, and render the ſick more weak and languiſhing: It often better ſucceeds, if they go to bed, and take ſome ſoft and pleaſing Liquor, as our own Ale, clear and mild, or Poſſet-drink with Cowſlip Flowers boiled in it, or an Emulſion of Melon Seeds, and Almonds in a great quantity, to wit, two or three pints.

its foreleading Cauſe.

which alſo cauſes waking in Melancholick People.

For the ſame reaſon Coffee cauſes waking.

An Hiſtory ſhewing an example of this Diſeaſe.

I was ſome times paſt conſulted with about an old *Hypochondriacal* perſon, who beſides other *Symptoms* uſual in that caſe, was for many years obnoxious to frequent, very troubleſome, and noiſie belchings: he was wont every day, two or three times, for about two hours, continually to belch, with ſuch a noiſe, that he might be heard far and near, at a great diſtance: But ſometimes for a week or two, and ſometimes

for

for a month, this belching would be changed into a long waking, for having that Diſtemper much remitted, this Gentleman was kept without ſleep almoſt whole nights; and when he had thus been for three days, and ſometimes more, perfectly waking, he ſeemed not to want ſleep, and complained not of ſleepineſs, dulneſs, or languor of ſpirits. And when *Narcoticks* rarely brought to him any help, he took ſometimes in the evening a Poſſet made of Ale and Canary Wine; and night coming on, he ſometimes drunk Diſtilled Waters, by the uſe of which, oftentimes he got ſome ſleep; then afterwards, his waking perfectly vaniſhing by degrees; his belching returned: Hence it appears, there was but one cauſe for either, to wit, the aduſt particles, and irritative, being poured forth from the bloody Maſs, ſometimes into the coats of the Ventricle, and ſometimes into the Cortical part of the Brain.

Secondly, beſides theſe diſtinct Diſtempers of Sleep and Waking, or their inordinations, there remain other conjunct, or complicated irregularities of them, in which, the acts of either function are prevaricated together. Which indeed is obſervable in that Diſtemper or affection called the Waking *Coma*; of which we ſhall now ſpeak briefly.

A deſcription of the waking Coma.

Thoſe ſick with the Waking *Coma*, although they are continually prone to ſleep, yet they can ſcarce ſleep at all, but after the manner of *Tantalus*, up to the chin in the *Lethean* River, to taſt which as ſoon as he ſtoops down, the water ſlides away from him and ſinks lower. For they feel a cruel heavineſs in their Heads, with a ſleepineſs or numneſs of all their ſenſes, and faculties, that they hardly endure to turn themſelves in their Bed, or to be diſturbed by the by-ſtanders with talking, and expect they ſhall preſently fall into a ſweet ſleep; but when they would indulge it, and endeavour ſtrongly to embrace it, various phantaſms rolling about in their mind, keep them ſtill waking; neither are they ſuffered to take any ſleep at all, which ſeems to them to be ſtill at hand. Upon this, not ſeldom follows a *Delirium*, that whilſt the ſick lye with their eyes ſhut, they perpetually talk abſurd and ſenſeleſs things, and fling about hither and thither their Arms and Legs exceſſively, and being raiſed up, they look about them doggedly. It is an uſual thing for thoſe ſick of Feavours, to remain a whole night as it were drowned in ſleep; and in the mean time are ſcarce ſilent a minute of an hour, but murmur various things to themſelves; alſo ſometimes cry out, houl, and leap out of Bed. If the reaſon of theſe be inquired after, we may ſay, that the Pores and paſſages in the Brain, which are the walking places of the Spirits, are very much poſſeſſed with a thick and ſoperiferous matter, poured forth from the Maſs of the Blood, that the Spirits being very much hindred from their wonted expanſion, and mutual commerce, an heavy and invincible ſleep ſeems to hang over them; but becauſe ſome ſharp and highly active particles, like ſo many goads, cleave to theſe Spirits, they are perpetually incited into motion; and ſo ſome of them break thorow the ways, howſoever faſt ſhut and ſtopped with mounds, and run forth either directly or obliquely as they can; and thus ſuch motions of theirs, however confuſed and diverted, by reaſon of impediments, and not able to exerciſe compleatly the Animal function, yet they eaſily drive away or hinder its ceſſation and reſt; for this reaſon indeed, ſuch who are diſtemper'd with this Diſeaſe, are like thoſe living under the Pole, who only ſee (when the Sun is in the *Equinox*) the light on the *Horizon*, and have neither perfect night, nor perfect day; ſo theſe only enjoy a kind of twilight betwixt ſleep and waking.

The cauſe of this Diſtemper known.

The Waking *Coma* is rarely a Diſeaſe of it ſelf, but for the moſt part it is a *ſymptom* coming upon other Diſeaſes, as the Feavour, Phrenſie, Lethargy, and the like; wherefore it requires not a Curatory Method peculiarly, but there is only need, that to the Remedies preſcribed for the firſt or primary Diſeaſe, there ſhould be added other *Cephalicks*, which may diſpel theſe clouds and meteors of the Brain; or if both will not be expelled together, the ſame Medicine which cheriſhes the parts of the one, getting the better, will immediately overcome the other; ſo in the Waking *Somnolency*, it is convenient to procure either perfect ſleep, or perfect waking, and in this caſe I have often given *Narcoticks* with good ſucceſs.

It is more often a ſymptom of other Diſtempers than a Diſeaſe of it ſelf.

CHAP.

CHAP. VI.

Of the Incubus, or Night-Mare.

The Seat of the Incubus is in the Cerebel.

THUS much concerning the morbid exorbitancies of irregular ſleep and waking; which are almoſt proper, and as it were of the region of the Brain, and affect not the *Cerebel* but rarely, and that ſecondarily and collaterally, as hath been ſhown. But there remains a diſtemper, commonly called the Night-Mare, in Latine the *Incubus*, which is both peculiar to this Region, and alſo ſeems in ſome meaſure analogical to the ſleepy diſeaſes; foraſmuch as its fits ariſe, for the moſt part from ſleep, by reaſon of the Animal Spirits being bound in the Cerebel or ſuppreſſed; their eclipſe or interruption (though ſhort) about the exerciſe of the vital function, is induced.

A Deſcription of it.

That the ſubject, nature, and cauſes of this Diſeaſe may be the better known, we ſhall firſt conſider its *Phænomena*, or the appearance of it. The fits of the *Incubus*, or Night-Mare, for the moſt part, and indeed only falling on one in ſleep, are uſed to be excited moſtly after the ſtomach is loaded with undigeſted meats, and lying on the back in Bed. They who labour with it, ſeem to feel the hurt chiefly in the Breaſt, and about the *Præcordia*, for reſpiration being ſuppreſſed, and very much hindred, they think that a certain weight lying heavily upon their Breaſt, doth oppreſs them, which weight mocks their imaginations with the Image of ſome ſpectre or other; and this, whilſt they think to ſhake off, or put away, by the moving of their Body or members, they are not able to ſtir themſelves any way: But after a long ſpace, and ſometimes till they are almoſt dead, they at laſt awake with a ſtrugling about their heart, and being more fully rouzed from ſleep, the imaginary weight ſuddenly vaniſhes, and the motive force of the body is reſtored, but for the moſt part a trembling of the heart remains, and frequently a ſwift and violent beating of the *Diaphragma*. Then the fit being over, the deception of the phantaſie, conceiving the horrid image of the *Incubus* or ſpectre, is perceived.

It moſt often proceeds from natural cauſes.

The common people ſuperſtitiouſly believe, that this paſſion is indeed cauſed by the Devil, and that the evil ſpirits lying on them, procures that weight and oppreſſion upon their heart. Though indeed we do grant, ſuch a thing may be, but we ſuppoſe that this *ſymptom* proceeds oftenеſt from mere natural cauſes; though what they are, and in what place the Morbific matter doth ſubſiſt, is not agreed on among Authors, nor indeed is it eaſily to be aſſigned.

The Seat of this is falſly placed in the Brain.

Becauſe the imagination is deceived, and the error being propagated further into the ſenſes themſelves, ſo impoſes on the ſight and feeling, that they believe they plainly ſee and feel a monſter of this or that ſhape or figure lying upon them; and for that the loco-motive faculty of the whole body is hindred, in the mean time; ſome have placed the ſeat of this Diſeaſe wholly in the Brain, and would have the oppreſſion of the breaſt to be merely phantaſtical: But although we grant the monſtrous ſhape of the *Incubus* (which is conceived) to be a mere dream; the Precordia to be truly affected, is apparent, and the motion of the Pulſe and breathing is ſuppreſſed or hindred; for that the heavy weight of the breaſt is plainly felt by moſt, in their waking, yea, and when thorowly freſh awaked, and when that is removed, the tremblings of the Heart and *Diaphragma*, and inordinate motions follow: whence it follows that theſe parts labour and ſuffer a real hurt.

The Præcordia truly labour.

The cauſe doth not ſtick partly in the Brain, and partly in the Breaſt.

Wherefore others, that they might the more eaſily unlooſe this knot, dividing the Morbific Cauſe, aſſign a portion of it to the Brain, and another to the Breaſt; for they ſay, that the motion of the Lungs are hindred, by a viſcous and very groſs humor impacted about them, and that doth excite as it were the oppreſſion of a bulk lying on them, with want of breathing; then Vapors being raiſed to the Head, do fill the principal Nerves, and ſo hinder the loco-motive force: which opinion (no more likely than the conceptions of thoſe troubled with the Night-Mare) deſerves not to be aſſented to; becauſe there are not any ſigns of this humor heaped up about the *Præcordia*, which appear before or after the fit, yea when this region is very much burthened, as in the *Phthiſis*, *Aſthma*, or Dropſie of the Breaſt, the *Incubus* does not therefore infeſt more frequently or more grievouſly: Further it appears not, how the matter heaped up in the *Præcordia*, ſhould be only troubleſome in ſleep, or by what paſſage or way, the Vapours from thence ſo ſuddenly inducing want of motion, ſhould be

be elevated to the Head. Wherefore, the Reaſon or *Æetiology* of this Diſtemper, I think to be taken or judged of far otherwiſe.

Therefore this heavy weight or load lying on the breaſt, ſeems indeed to be left, becauſe the motion of the Heart, and the organs ſerving for breathing, is hindred; for from the motion of the heart ceaſing, or being hardly performed, the Blood in its boſoms, and in the breathing or *Pneumonick* Veſſels ſtatgnating, and being there very much ſtreightned, a ſenſe of as it were a weight opreſſes the region of the breaſt: which alſo ſeems therefore the more grievous, becauſe the Lungs, *Diaphragma*, and Muſcles of the *Thorax*, being hindred in their motions, and as it were bound together, at the ſame time with the heart, do labour with a great endeavour, to exerciſe or to put forth themſelves. But the moſt hard queſtion yet is, concerning the Cauſe, by reaſon of which the motion or action of the Prærordia is ſuppreſſed, or hindred. This ſeems impoſſible to be done by matter impacted in the organs themſelves, of which indeed, there muſt be a very great deal, to ſuffice for the hindrance of ſo many parts, and ſome ſigns of it at leaſt would appear ſomewhat out of the fit; wherefore, it ſeems that we may rather ſay, that the action of thoſe parts are hindred, becauſe the influx of the animal ſpirits are hindred or ſuppreſſed. This is frequently done in Convulſive Diſtempers, as we have elſewhere declared, and have clearly ſhewed by *Anatomical* Experiment, to wit, by tying the trunk of the Nerves of the eighth pair, in a living Dog: But in thoſe diſtemper'd by the *Incubus* or Night-Mare, the obſtruction of the Spirits, ſeems to be excited neither in the organs themſelves, nor in their Nerves; for ſuch a cauſe happening to thoſe awake as well as to thoſe ſleeping, doth not become preſently moveable, but is fixed and permanent.

The next cauſe of this is, the hindrance of the inflowing of the Spirits to the Præcordia.

This not in the Parts afflicted;

Nor in the Nerves themſelves:

Wherefore, we think the fit of the Night-Mare to be induced, for that in ſleeping, a certain incongruous matter is inſtilled into the Cerebel, together with the nervous Juice, which cauſing a certain torpor or benummedneſs in the firſt ſpring of the ſpirits, compells them immediately, by little and little, to ceaſe from the offices of their functions; ſo that as it were another Lethargy being excited within the Cerebel, the vital actions ſuffer a ſhort eclipſe; during which, partly from a ſtrife of the obſtructed or bound together *Præcordia*, and partly from the blood very much heaped up and ſtagnating in them, that weight, or a ſenſe as it were of a great bulk lying on them, is cauſed; then, becauſe all the reſt of the faculties depend upon the motion of the heart, therefore this being ſuppreſſed and hindred, preſently thoſe eclipſes or diſorders of them follow; but eſpecially becauſe the flowing of the Blood into the Brain, for the making of Animal Spirits, is interrupted, therefore immediately the flowing forth of theſe into the nervous *Syſtem* is ſuppreſſed, ſo that the ſick, whilſt they endeavour to ſhake off the imaginary load of the breaſt, are not able to move their Body, or any member; to wit, becauſe the irradiation of the Spirits, (whilſt they are deſtitute of the flowing in of the Blood) is kept from the moving parts: In the mean time, thoſe which reſide in the Brain, being ſpread abroad here and there, conceive confuſed phantaſms, and from the trouble impreſſed from the *Præcordia*, horrid dreams of ſpectres.

But happens in the Cerebel, where the firſt Spring of the Spirits is.

From whence the ſenſe of the weight proceeds.

Whence loſs of motion proceeds.

The fit of the *Incubus* is ſoon ended, becauſe the matter, rarely or never entring deeply into the Cerebel, is eaſily ſhaken off, or is ſupt back again into the Blood: for after the ſpirits became free from its embrace, and having got the liberty of motion within their wonted ſpaces, they repeat the exerciſes of their functions: wherefore, the afflux of the Blood then preſently returning to the Brain, immediately the afflux or flowing forth, and emanation of the Spirits, are reſtored, like a light new kindled, both in its middle or marrowy part, and alſo in the nervous Stock: whence they being awakened, the motive force returns, and the error of the imagination is perceived. But that there follow in the Heart and *Diaphragma* tremblings and moſt ſwift beatings, the reaſon is, becauſe theſe Bodies, ſo long as they were hindred from their motions labouring with an endeavour of exerciſing, or putting forth themſelves, are not able to contain themſelves within their juſt limits, aſſoon as they are reſtored, but putting forth at once all their ſtrength, and being too active, exceed the due performance of their duty: even as a wand, being held a while bent, being afterwards let go, recovering it ſelf with a certain force, enters into a motion of trembling or ſhaking.

Wherefore the fit being ſo grievous, is ſo ſoon ended, without leaving any evil.

Whence after the Fit, the tremblings of the Heart and the Præcordia.

After this manner, the fit of the Night-Mare, becauſe it immediately ſtops the vital function, as it were the firſt moving wheel in the animal Machine, compels forthwith all the other faculties to ceaſe, yea the whole corporeal ſoul (more than the more grievous fits of the *Apoplexy* or the *Lethargy*) to ſhake, and as it were to ſuffer an eclipſe. Notwithſtanding, little danger is threatned from this Diſtemper, becauſe the Morbific matter being poured forth from the Blood, into the compaſs of the Cerebel,

The Incubus of it ſelf rarely dangerous.

Cerebel, is not ſuffer'd to penetrate deeply; becauſe the Spirits of that province, being always in a readineſs and watchful, moſt ſwiftly run to meet the enemy, and oppoſe his entrance ſtrongly, though the offices of the vital function be omitted in the mean time; further, the Animal Spirits which are in the region of the Brain, being awakened, fly preſently to aſſiſt thoſe of the labouring Cerebel: For thoſe ſick of the *Incubus*, if by chance they be awakened by any one lying with them, they ſooner come out of the fit.

The Prognoſtick of the Incubus. But although it is rare, that any one dyes of this Diſeaſe only; yet thoſe often obnoxious to it, if they are taken with other *Cephalick* Diſtempers, as the *Lethargy*, *Carus*, *Apoplexy*, or the *Epilepſie*, are in far greater danger: becauſe the Morbific matter, being poured forth from the Blood into the Brain, eaſily invades the Cerebel ſo prediſpoſed; ſo that the ſick therefore ſuffering at once an eclipſe of the vital and the animal function, are brought into greater danger of their Life. Hence 'tis a vulgar obſervation, that thoſe who frequently are troubled with the *Night-Mare*, fall into the *Apoplexy*.

The Event of it is ſhewn. There is wont to be another event of the *Incubus*, leſs dangerous, that leads often into the *Cardiack* paſſion, and other affections, commonly taken to be *Hypochondriack*. I knew ſeveral while young, grievouſly afflicted with the *Night-Mare*, who being freed from it in their riper Age, were troubled with the trembling and palpitation of the Heart, and other pains about the *Præcordia*, and *Hypochondria*; and alſo with Convulſions in thoſe parts. We think the cauſe of this morbid commutation to be, becauſe the Morbific matter, after it was wont ſo often to beſiege the region of the Cerebel, at length an impreſſion being made, it did penetrate more deeply into ſome private place, and paſſing thorow its frame, became impacted on the Nerves deſtinated to the *Præcordia*.

Its Cure. As to the Cure of this Diſeaſe, there needs no help for the fits, becauſe they paſs away quickly of themſelves. The method of Cure after a conſidering the whole, ſuggeſts Blood-letting, (where it is convenient) and a gentle Purge, and chiefly the uſe of Remedies, which are commonly called *Cephalicks*. Therefore, here Powders of *Amber*, *Coral*, and *Pearls*, with the Roots of the *Male Pœony*, *Cretick Dittany*, *Contrayerva*; alſo *Electuaries*, *Tablets*, and *Diſtilled Waters*, *Tinctures*, *Elixirs*, and other things that are wont to be preſcribed in the *Lethargy* and *Apoplexy*, have the chief place; but eſpecially a right courſe of dyet being ordered, let groſs and ill digeſted meats be ſhunned, Pulſe and Summer-fruits; nor let ſleep, ſtudy, or reading be preſently yielded to after eating: late and large Suppers, and lying on the back, are to be forbidden.

Infants and Boys obnoxious to this Diſeaſe, how they ought to be handled. Becauſe Children and Youths, are often ſick of this Diſeaſe (the ſign of which is, that they are ſhaken in their ſleeping, and waking cruelly cry out) and more often ſuffer its fits, which oftentimes bring them to Convulſive paſſions, therefore a method of healing them ought to be adminiſtered, as ſoon as they are ſeen to be diſtemper'd: you ought to inquire into the milk they ſuck, whether it be of it ſelf pure and laudable, and truly convenient for the Stomach: let them not ſleep preſently after they have ſucked their fill: The Nurſe uſing a good dyet, let her take alſo Morning and Evening a Doſe of *Cephalick* Powder, or *Electuary*, drinking after it a draught of Poſſet drink, with the leaves of Sage or Betony, or the Roots or Seeds of *Pœony* boiled in it: Let the Infant take twice a day, a ſpoonful of proper Diſtilled Water. Let him have an Iſſue made in the nape of the Neck, and let it lye ſometimes on one ſide, and ſometimes on the other, and rarely or never on its back. If a Neck-lace of Coral, or little balls of the Seeds or Roots of the *male Pœony* be worn about the Neck, or at the pit of the Stomach, it is not altogether uſeleſs; if that in ſleep being often and grievouſly ſhaken, they are ſeen to be more dangerouſly troubled with this Diſtemper, let Bliſters be raiſed in the hinder part of the Neck, or behind the Ears; alſo Evening and Morning let there be daily given a Doſe of the Powder of *Ammoniacum*, or other proper Doſe, in a ſpoonful of Diſtilled Water or *Julep*.

CHAP.

CHAP. VII.

Of the Vertigo, or a turning round in the Head.

HAving viewed the exterior compaſs of either part of the Head, and detected the Diſeaſes which beſet the ſenſitive ſoul, about the firſt beginnings, and laſt ſprings of the Animal Spirits; we ſhall next deſcend to the middle part of the Brain, where the phantaſie and common ſenſe reſide, and behold what kind of paſſions theſe parts are obnoxious to. Concerning this in the firſt place we ſhall note, that ſometimes troops or rather mighty armies of Spirits, inhabiting theſe places, are affected, and ſometimes alſo ſmall handfuls or bands: then again many of them are affected together, or elſe only a few at a time; or they become Elaſtick from an heterogeneous *Copula*, and ſo are compelled into inordinate motions, or as it were exploſive or ſhooting off, as in the *Epileptick* fit; or ſuffering an *eclipſe*, as in the *Apoplexy*, are deprived of all motion. Concerning the former diſpoſition of the Spirits, we have formerly treated largely enough, and the aſtoniſhing Diſeaſe we ſhall handle afterwards. But in this place, we ſhall ſpeak of a certain Paſſion or diſtemper belonging to theſe parts, *viz.* the *Vertigo*, in which a certain band or handful of the Spirits are affected, and their motions are ſeen to be partly perverted, and partly ſuppreſſed. *The Seat of the Vertigo.*

Being but little ſolicitous about the names by which the *Vertigo* is wont to be known, we ſhall deſcribe the nature, or formal reaſon of it after this manner, *viz.* "The "*Vertigo* is an Affection or Diſtemper, in which the viſible objects ſeem to turn "round, and the ſick feel a perturbation, or confuſion of the Animal Spirits in the "Brain that they do not rightly flow into the Nerves: Wherefore the viſive, and "the loco-motive faculties, do often in ſome meaſure fail, that thoſe labouring with "it fall, and oftentimes are covered with darkneſs. *A Deſcription of it.*

In this fit it is obſerved, that the imagination and the common ſenſe are in a manner deceived, whilſt they believe, the quiet objects to be moved, but the rational judgment remains; for we underſtand our error, and we preſently aſcribe this fallacy to the inordination of the Animal Spirits; for that we plainly know that the ſpirits flowing within the Brain do decline from their wonted irradiation or beaming forth, and do not rightly perform the offices of motion and ſenſation, during the fit.

That we may find out the Morbific Cauſe, and the preternatural manner of the *Vertigo*, we ſhall inquire after what manner this ſame affection or Diſtemper, how extempory or ſudden ſoever it be, is wont to be excited from non-natural things; for men ordinarily become Vertiginous (or have a turning in their head) with a long turning round of the body, looking down from an high place, paſſing over Bridges, Sailing, and by Drunkenneſs, and many other ways. It will be worth our while to conſider a little further, the means of affecting, by which theſe exterior actions ſtir up this turning or rolling about, from whence it will the better appear, what kind of intrinſick cauſes may be able to excite this paſſion. In the firſt place therefore, when men are for ſome time turned about, both in that motion all things ſeem to be turned about, and alſo they ceaſing from turning about, that ſtill continues in the phantaſie; ſo that the affected oftentimes fall to the ground; further, though they ſhut their eyes, they ſtill perceive as it were a turning round, like the turning about of a Mill, in the Brain. *The Cauſes and the Manner of the non-natural Vertigo.*

The reaſon of theſe is not, that the deception of the ſight is firſt brought to the eyes, and afterwards continued for ſome time; becauſe this affection is cauſed by the turning round of the body, whether they look with, or ſhut their eyes: But indeed the cauſe of this apparition wholly depends upon the fluid ſubſtance of the animal ſpirits. For that the ſpirits flowing within the Brain, are even like to water, or a thick heap of Vapors, included in a Phial, which being ſhaken round about, together with the Veſſel, and made ſo to turn about, continues for a time that motion, though the Veſſel ſtands ſtill; in like manner alſo, when the body of a man is turned round about, the ſpirits inhabiting the Brain, from that turning about of the Head, like the containing Veſſel, are agitated into ſpiral or round motions; and when therefore they cannot irradiate the Nerves with their wonted influx and direct beams, from hence oftentimes a *Scotomy* or dizzneſs, and a failing of the feet, together with a rotation or whirling about of viſible objects, are induced. The viſible Hemiſphere ſeems to turn round, becauſe as the ſenſible impreſ- *The Reaſons of them ſhewn.*

Cerebel, is not ſuffer'd to penetrate deeply; becauſe the Spirits of that province, being always in a readineſs and watchful, moſt ſwiftly run to meet the enemy, and oppoſe his entrance ſtrongly, though the offices of the vital function be omitted in the mean time; further, the Animal Spirits which are in the region of the Brain, being awakened, fly preſently to aſſiſt thoſe of the labouring Cerebel: For thoſe ſick of the *Incubus*, if by chance they be awakened by any one lying with them, they ſooner come out of the fit.

The Prognoſtick of the Incubus.

But although it is rare, that any one dyes of this Diſeaſe only; yet thoſe often obnoxious to it, if they are taken with other *Cephalick* Diſtempers, as the *Lethargy*, *Carus*, *Apoplexy*, or the *Epilepſie*, are in far greater danger: becauſe the Morbific matter, being poured forth from the Blood into the Brain, eaſily invades the Cerebel ſo prediſpoſed; ſo that the ſick therefore ſuffering at once an eclipſe of the vital and the animal function, are brought into greater danger of their Life. Hence 'tis a vulgar obſervation, that thoſe who frequently are troubled with the *Night-Mare*, fall into the *Apoplexy*.

The Event of it is ſhewn.

There is wont to be another event of the *Incubus*, leſs dangerous, that leads often into the *Cardiack* paſſion, and other affections, commonly taken to be *Hypochondriack*. I knew ſeveral while young, grievouſly afflicted with the *Night-Mare*, who being freed from it in their riper Age, were troubled with the trembling and palpitation of the Heart, and other pains about the *Præcordia*, and *Hypochondria*; and alſo with Convulſions in thoſe parts. We think the cauſe of this morbid commutation to be, becauſe the Morbific matter, after it was wont ſo often to beſiege the region of the Cerebel, at length an impreſſion being made, it did penetrate more deeply into ſome private place, and paſſing thorow its frame, became impacted on the Nerves deſtinated to the *Præcordia*.

Its Cure.

As to the Cure of this Diſeaſe, there needs no help for the fits, becauſe they paſs away quickly of themſelves. The method of Cure after a conſidering the whole, ſuggeſts Blood-letting, (where it is convenient) and a gentle Purge, and chiefly the uſe of Remedies, which are commonly called *Cephalicks*. Therefore, here Powders of *Amber*, *Coral*, and *Pearls*, with the Roots of the *Male Pœony*, *Cretick Diſtany*, *Contrayerva*; alſo *Electuaries*, *Tablets*, and *Diſtilled Waters*, *Tinctures*, *Elixirs*, and other things that are wont to be preſcribed in the *Lethargy* and *Apoplexy*, have the chief place; but eſpecially a right courſe of dyet being ordered, let groſs and ill digeſted meats be ſhunned, Pulſe and Summer-fruits; nor let ſleep, ſtudy, or reading be preſently yielded to after eating: late and large Suppers, and lying on the back, are to be forbidden.

Infants and Boys obnoxious to this Diſeaſe, how they ought to be handled.

Becauſe Children and Youths, are often ſick of this Diſeaſe (the ſign of which is, that they are ſhaken in their ſleeping, and waking cruelly cry out) and more often ſuffer its fits, which oftentimes bring them to Convulſive paſſions, therefore a method of healing them ought to be adminiſtered, as ſoon as they are ſeen to be diſtemper'd: you ought to inquire into the milk they ſuck, whether it be of it ſelf pure and laudable, and truly convenient for the Stomach: let them not ſleep preſently after they have ſucked their fill: The Nurſe uſing a good dyet, let her take alſo Morning and Evening a Doſe of *Cephalick* Powder, or *Electuary*, drinking after it a draught of Poſſet drink, with the leaves of Sage or Betony, or the Roots or Seeds of *Pœony* boiled in it: Let the Infant take twice a day, a ſpoonful of proper Diſtilled Water. Let him have an Iſſue made in the nape of the Neck, and let it lye ſometimes on one ſide, and ſometimes on the other, and rarely or never on its back. If a Neck-lace of Coral, or little balls of the Seeds or Roots of the *male Pœony* be worn about the Neck, or at the pit of the Stomach, it is not altogether uſeleſs; if that in ſleep being often and grievouſly ſhaken, they are ſeen to be more dangerouſly troubled with this Diſtemper, let Bliſters be raiſed in the hinder part of the Neck, or behind the Ears; alſo Evening and Morning let there be daily given a Doſe of the Powder of *Ammoniacum*, or other proper Doſe, in a ſpoonful of Diſtilled Water or *Julep*.

CHAP. VII.

Of the Vertigo, or a turning round in the Head.

HAving viewed the exterior compaſs of either part of the Head, and detected the Diſeaſes which beſet the ſenſitive ſoul, about the firſt beginnings, and laſt ſprings of the Animal Spirits; we ſhall next deſcend to the middle part of the Brain, where the phantaſie and common ſenſe reſide, and behold what kind of paſſions theſe parts are obnoxious to. Concerning this in the firſt place we ſhall note, that ſometimes troops or rather mighty armies of Spirits, inhabiting theſe places, are affected, and ſometimes alſo ſmall handfuls or bands: then again many of them are affected together, or elſe only a few at a time; or they become Elaſtick from an heterogeneous *Copula*, and ſo are compelled into inordinate motions, or as it were exploſive or ſhooting off, as in the *Epileptick* fit; or ſuffering an *eclipſe*, as in the *Apoplexy*, are deprived of all motion. Concerning the former diſpoſition of the Spirits, we have formerly treated largely enough, and the aſtoniſhing Diſeaſe we ſhall handle afterwards. But in this place, we ſhall ſpeak of a certain Paſſion or diſtemper belonging to theſe parts, *viz.* the *Vertigo*, in which a certain band or handful of the Spirits are affected, and their motions are ſeen to be partly perverted, and partly ſuppreſſed. *The Seat of the Vertigo.*

Being but little ſolicitous about the names by which the *Vertigo* is wont to be known, we ſhall deſcribe the nature, or formal reaſon of it after this manner, *viz.* "The "*Vertigo* is an Affection or Diſtemper, in which the viſible objects ſeem to turn "round, and the ſick feel a perturbation, or confuſion of the Animal Spirits in the "Brain that they do not rightly flow into the Nerves: Wherefore the viſive, and "the loco-motive faculties, do often in ſome meaſure fail, that thoſe labouring with "it fall, and oftentimes are covered with darkneſs. *A Deſcription of it.*

In this fit it is obſerved, that the imagination and the common ſenſe are in a manner deceived, whilſt they believe, the quiet objects to be moved, but the rational judgment remains; for we underſtand our error, and we preſently aſcribe this fallacy to the inordination of the Animal Spirits; for that we plainly know that the ſpirits flowing within the Brain do decline from their wonted irradiation or beaming forth, and do not rightly perform the offices of motion and ſenſation, during the fit.

That we may find out the Morbific Cauſe, and the preternatural manner of the *Vertigo*, we ſhall inquire after what manner this ſame affection or Diſtemper, how extempory or ſudden ſoever it be, is wont to be excited from non-natural things; for men ordinarily become Vertiginous (or have a turning in their head) with a long turning round of the body, looking down from an high place, paſſing over Bridges, Sailing, and by Drunkenneſs, and many other ways. It will be worth our while to conſider a little further, the means of affecting, by which theſe exterior actions ſtir up this turning or rolling about, from whence it will the better appear, what kind of intrinſick cauſes may be able to excite this paſſion. In the firſt place therefore, when men are for ſome time turned about, both in that motion all things ſeem to be turned about, and alſo they ceaſing from turning about, that ſtill continues in the phantaſie; ſo that the affected oftentimes fall to the ground; further, though they ſhut their eyes, they ſtill perceive as it were a turning round, like the turning about of a Mill, in the Brain. *The Cauſes and the Manner of the non-natural Vertigo.*

The reaſon of theſe is not, that the deception of the ſight is firſt brought to the eyes, and afterwards continued for ſome time; becauſe this affection is cauſed by the turning round of the body, whether they look with, or ſhut their eyes: But indeed the cauſe of this apparition wholly depends upon the fluid ſubſtance of the animal ſpirits. For that the ſpirits flowing within the Brain, are even like to water, or a thick heap of Vapors, included in a Phial, which being ſhaken round about, together with the Veſſel, and made ſo to turn about, continues for a time that motion, though the Veſſel ſtands ſtill; in like manner alſo, when the body of a man is turned round about, the ſpirits inhabiting the Brain, from that turning about of the Head, like the containing Veſſel, are agitated into ſpiral or round motions; and when therefore they cannot irradiate the Nerves with their wonted influx and direct beams, from hence oftentimes a *Scotomy* or dizzneſs, and a failing of the feet, together with a rotation or whirling about of viſible objects, are induced. The viſible Hemiſphere ſeems to turn round, becauſe as the ſenſible impreſ- *The Reaſons of them ſhewn.*

Cerebel, is not ſuffer'd to penetrate deeply; becauſe the Spirits of that province, being always in a readineſs and watchful, moſt ſwiftly run to meet the enemy, and oppoſe his entrance ſtrongly, though the offices of the vital function be omitted in the mean time; further, the Animal Spirits which are in the region of the Brain, being awakened, fly preſently to aſſiſt thoſe of the labouring Cerebel: For thoſe ſick of the *Incubus*, if by chance they be awakened by any one lying with them, they ſooner come out of the fit.

The Prognoſtick of the Incubus. But although it is rare, that any one dyes of this Diſeaſe only; yet thoſe often obnoxious to it, if they are taken with other *Cephalick* Diſtempers, as the *Lethargy*, *Carus*, *Apoplexy*, or the *Epilepſie*, are in far greater danger: becauſe the Morbific matter, being poured forth from the Blood into the Brain, eaſily invades the Cerebel ſo prediſpoſed; ſo that the ſick therefore ſuffering at once an eclipſe of the vital and the animal function, are brought into greater danger of their Life. Hence 'tis a vulgar obſervation, that thoſe who frequently are troubled with the *Night-Mare*, fall into the *Apoplexy*.

The Event of it is ſhewn. There is wont to be another event of the *Incubus*, leſs dangerous, that leads often into the *Cardiack* paſſion, and other affections, commonly taken to be *Hypochondriack*. I knew ſeveral while young, grievouſly afflicted with the *Night-Mare*, who being freed from it in their riper Age, were troubled with the trembling and palpitation of the Heart, and other pains about the *Præcordia*, and *Hypochondria*; and alſo with Convulſions in thoſe parts. We think the cauſe of this morbid commutation to be, becauſe the Morbific matter, after it was wont ſo often to beſiege the region of the Cerebel, at length an impreſſion being made, it did penetrate more deeply into ſome private place, and paſſing thorow its frame, became impacted on the Nerves deſtinated to the *Præcordia*.

Its Cure. As to the Cure of this Diſeaſe, there needs no help for the fits, becauſe they paſs away quickly of themſelves. The method of Cure after a conſidering the whole, ſuggeſts Blood-letting, (where it is convenient) and a gentle Purge, and chiefly the uſe of Remedies, which are commonly called *Cephalicks*. Therefore, here Powders of *Amber*, *Coral*, and *Pearls*, with the Roots of the *Male Pœony*, *Cretick Dittany*, *Contrayerva*; alſo *Electuaries*, *Tablets*, and *Diſtilled Waters*, *Tinctures*, *Elixirs*, and other things that are wont to be preſcribed in the *Lethargy* and *Apoplexy*, have the chief place; but eſpecially a right courſe of dyet being ordered, let groſs and ill digeſted meats be ſhunned, Pulſe and Summer-fruits; nor let ſleep, ſtudy, or reading be preſently yielded to after eating: late and large Suppers, and lying on the back, are to be forbidden.

Infants and Boys obnoxious to this Diſeaſe, how they ought to be handled. Becauſe Children and Youths, are often ſick of this Diſeaſe (the ſign of which is, that they are ſhaken in their ſleeping, and waking cruelly cry out) and more often ſuffer its fits, which oftentimes bring them to Convulſive paſſions, therefore a method of healing them ought to be adminiſtered, as ſoon as they are ſeen to be diſtemper'd: you ought to inquire into the milk they ſuck, whether it be of it ſelf pure and laudable, and truly convenient for the Stomach: let them not ſleep preſently after they have ſucked their fill: The Nurſe uſing a good dyet, let her take alſo Morning and Evening a Doſe of *Cephalick* Powder, or *Electuary*, drinking after it a draught of Poſſet drink, with the leaves of Sage or Betony, or the Roots or Seeds of *Pœony* boiled in it: Let the Infant take twice a day, a ſpoonful of proper Diſtilled Water. Let him have an Iſſue made in the nape of the Neck, and let it lye ſometimes on one ſide, and ſometimes on the other, and rarely or never on its back. CHAP. VII.

Of the Vertigo, or a turning round in the Head.

HAving viewed the exterior compaſs of either part of the Head, and detected the Diſeaſes which beſet the ſenſitive ſoul, about the firſt beginnings, and laſt ſprings of the Animal Spirits; we ſhall next deſcend to the middle part of the Brain, where the phantaſie and common ſenſe reſide, and behold what kind of paſſions theſe parts are obnoxious to. Concerning this in the firſt place we ſhall note, that ſometimes troops or rather mighty armies of Spirits, inhabiting theſe places, are affected, and ſometimes alſo ſmall handfuls or bands: then again many of them are affected together, or elſe only a few at a time; or they become Elaſtick from an heterogeneous *Copula*, and ſo are compelled into inordinate motions, or as it were exploſive or ſhooting off, as in the *Epileptick* fit; or ſuffering an *eclipſe*, as in the *Apoplexy*, are deprived of all motion. Concerning the former diſpoſition of the Spirits, we have formerly treated largely enough, and the aſtoniſhing Diſeaſe we ſhall handle afterwards. But in this place, we ſhall ſpeak of a certain Paſſion or diſtemper belonging to theſe parts, *viz.* the *Vertigo*, in which a certain band or handful of the Spirits are affected, and their motions are ſeen to be partly perverted, and partly ſuppreſſed. *The Seat of the Vertigo.*

Being but little ſolicitous about the names by which the *Vertigo* is wont to be known, we ſhall deſcribe the nature, or formal reaſon of it after this manner, *viz.* "The "*Vertigo* is an Affection or Diſtemper, in which the viſible objects ſeem to turn "round, and the ſick feel a perturbation, or confuſion of the Animal Spirits in the "Brain that they do not rightly flow into the Nerves: Wherefore the viſive, and "the loco-motive faculties, do often in ſome meaſure fail, that thoſe labouring with "it fall, and oftentimes are covered with darkneſs. *A Deſcription of it.*

In this fit it is obſerved, that the imagination and the common ſenſe are in a manner deceived, whilſt they believe, the quiet objects to be moved, but the rational judgment remains; for we underſtand our error, and we preſently aſcribe this fallacy to the inordination of the Animal Spirits; for that we plainly know that the ſpirits flowing within the Brain do decline from their wonted irradiation or beaming forth, and do not rightly perform the offices of motion and ſenſation, during the fit.

That we may find out the Morbific Cauſe, and the preternatural manner of the *Vertigo*, we ſhall inquire after what manner this ſame affection or Diſtemper, how extempory or ſudden ſoever it be, is wont to be excited from non-natural things; for men ordinarily become Vertiginous (or have a turning in their head) with a long turning round of the body, looking down from an high place, paſſing over Bridges, Sailing, and by Drunkenneſs, and many other ways. It will be worth our while to conſider a little further, the means of affecting, by which theſe exterior actions ſtir up this turning or rolling about, from whence it will the better appear, what kind of intrinſick cauſes may be able to excite this paſſion. In the firſt place therefore, when men are for ſome time turned about, both in that motion all things ſeem to be turned about, and alſo they ceaſing from turning about, that ſtill continues in the phantaſie; ſo that the affected oftentimes fall to the ground; further, though they ſhut their eyes, they ſtill perceive as it were a turning round, like the turning about of a Mill, in the Brain. *The Cauſes and the Manner of the non-natural Vertigo.*

The reaſon of theſe is not, that the deception of the ſight is firſt brought to the eyes, and afterwards continued for ſome time; becauſe this affection is cauſed by the turning round of the body, whether they look with, or ſhut their eyes: But indeed the cauſe of this apparition wholly depends upon the fluid ſubſtance of the animal ſpirits. For that the ſpirits flowing within the Brain, are even like to water, or a thick heap of Vapors, included in a Phial, which being ſhaken round about, together with the Veſſel, and made ſo to turn about, continues for a time that motion, though the Veſſel ſtands ſtill; in like manner alſo, when the body of a man is turned round about, the ſpirits inhabiting the Brain, from that turning about of the Head, like the containing Veſſel, are agitated into ſpiral or round motions; and when therefore they cannot irradiate the Nerves with their wonted influx and direct beams, from hence oftentimes a *Scotomy* or dizzneſs, and a failing of the feet, together with a rotation or whirling about of viſible objects, are induced. The viſible Hemiſphere ſeems to turn round, becauſe as the ſenſible impreſ- *The Reaſons of them ſhewn.*

ſion is received by the means of the recipient, ſo the objects, as the ſpirits, ſeem to be moved round about.

Why looking down from on high, and paſſing over Bridges, cauſe a turning round in the Head.

Secondly, looking from on high, and paſſing over Bridges, ſtir up a *Vertigo* or giddineſs in the Head, for that there is a terror caſt on the imagination from unaccuſtomed objects, as alſo from the ſite of the body, or going in danger, whence that being very ſolicitous, how it ſhould rightly order and more firmly direct the ſpirits into the bodies of the Nerves, calls them back into the middle part of the Brain, and ſo perverts them from their wonted afflux and irradiation; and whilſt it indeavours to ſet their battel in better array, and to direct them more ſurely, by too great a care, drives them into a certain confuſion and irregular motion. Wherefore 'tis obſerved, that drunken men, and very bold, becauſe they are not careful or ſolicitous concerning the guiding of the animal ſpirits, ſuffer no ſuch thing. Sailing, or riding in a Coach, cauſes a turning in the Head by the like reaſon, as the turning round of the Body; becauſe, the very fluid ſpirits being too much agitated, like water ſhaken in a Glaſs, leap hither and thither diſorderly. Further, it is wholly for the ſame reaſon, why many going by Ship, or by Coach, are ſubject alſo to cruel Vomiting; to wit, becauſe the ſpirits being ſnatched into diſorder, by too great a motion, and confuſed fluctuation, run inordinately into the heads of the Nerves of the wandring pair, and for that reaſon ſtir up Convulſions and Convulſive motions in the Bowels.

How Drunkenneſs.

Thirdly, 'Tis obſerved, that the *Vertigo* comes upon Drunkenneſs, as a known *ſymptom*; and that to thoſe unaccuſtomed, the drinking, though moderately, of Wine or ſtrong Ale, alſo the taking of *Tabaco*, eaſily induces the ſame affection; the reaſon of which is, becauſe from the Liquor, or vapour ſo taken, certain fierce particles, and untameable, are carried into the Brain, by the paſſages of the Blood and nervous Juice; which being improportionate, and incongruous to the Animal Spirits, drive them hither and thither from their wonted tracks of flowing and reflowing or ebbing, and ſo move them into whirlings, and turnings about.

A perturbation of the Spirits in the Brain, and a revocation of them from their flowing into the Nerves, depend mutually on one another.

Theſe are the chief occaſions, or ſolitary evident cauſes, which do uſe to bring the *Vertigo*, or turning round in the Head to ſome men, how found of conſtitution ſoever they be: which kind of effect, theſe occaſions produce, foraſmuch as the Animal Spirits, being diſturbed beyond their ſet courſes, and orders, are moved inordinately, fluctuating here and there, both within the paſſages of the Brain, and alſo ſome of them, like a thred broken off, from their wonted irradiation, into the nervous Stock. For theſe being always reciprocal, depend mutually one of another, to wit, a perturbation of the Spirits within the middle part of the Brain, and their flowing forth into the nervous Stock being hindered; for from what ever cauſe either effect is induced, the other immediately follows. A turning round of the body, going in a Coach, or in a Boat or Ship, alſo Drunkenneſs, and the unaccuſtomed fume of *Tabaco*, compel the ſpirits in the Brain to fluctuate and ſhake diſorderly, which, for that cauſe, are preſently inhibited from their wonted flowing into the Nerves, that thoſe ſo affected, can hardly go or ſtand; in like manner, on the contrary, looking from on high, paſſing over Bridges, a languiſhment or *ſyncope* falling on them, recal the ſpirits from their wonted emanation, who, for that cauſe tumultuating within the Brain, or being moved inordinately, cauſe a *Scotomy* or dizzineſs, or a turning round of the objects.

From what cauſes the preternatural Vertigo is wont to be excited.

Theſe things being thus premiſed, concerning the *Vertigo*, raiſed up by reaſon of an outward accident, or from a ſolitary evident and non-natural cauſe; we ſhall next inquire, how and by what means, it is wont to be induced, from an intrinſick and preternatural cauſe.

Concerning theſe take notice, that the *Vertigo* is ſometimes a ſymptom depending upon ſome other Diſtemper, placed ſometimes within the Brain, and ſometimes without it: but ſometimes this is a Diſeaſe of it ſelf, which being raiſed up within the middle part of the Brain, becomes very troubleſome, and often terrible, and very hard to be Cured.

Sometimes the Vertigo is a ſymptom of other Cephalick Diſeaſes.

As to the former, many *Cephalick* Diſeaſes (or ſuch as belong to the Head) *viz.* Acute pain, the *Lethargy*, *Epilepſie*, *Carus*, *Apoplexy*, with many others, do often accompany the *Vertigo*; to wit, becauſe the equal expanſion of the Spirits in the Brain, and therefore their irradiation into the nervous Stock, from ſuch like various Morbific cauſes, are eaſily hindred or diſturbed; as ſhall hereafter appear, when we deliver the *Aetiology* or reaſon of the *Vertigo*, as it is a Diſeaſe of the Brain.

Sometimes it is excited by reaſon of the Diſtemper of other

But ſometimes this *ſymptom* is wont to be produced, by reaſon of other Diſtempers, placed a long way from the Brain, and that chiefly by two ways or means. For firſt it is uſual for a dizzineſs to ariſe, by reaſon of the flowing of the Blood being ſud-

denly

denly called away from the Brain, as in a *Syncope* or Swooning, great want coming near it, wicked hard labour great *Hæmorrhagies* or expence of blood, long fasting, in passions of violent sadness and fear; yea by reason of other occasions, when the motion of the blood is deficient or fails in the heart; so that the affected are proclive to faintings and swooning away; presently, because the tribute of the vital liquor is withdrawn, the animal Spirits growing deficient in the Brain, withdraw their radiation from the nervous Stock; for when their spring is cut off, those that remain, leaping back from their emanation, wander about confusedly in the Brain, and very often stir up the Vertiginous Distemper.

distant parts, viz. from the stomach, spleen, &c. and so by two means:
1. Either by reason of the Flood of the Blood being kept back.

Secondly, an inordinate recourse or flowing back of the Animal Spirits, from some inward, or from some outward member, often causes the *Vertigo*: forasmuch as the Spirits being disturbed from the affected part, by a long series, thorow the passages of the Nerves, at length disturb others inhabiting the middle part of the Brain, and drive them into the like disorders; for this cause it is, that sharp humors gnawing or pulling the Fibres of the Ventricle, because the infestous and irritative matter being moved in the Spleen, *Pancreas*, or Intestines, causes light dizzinesses in the Brain. I have known from an accute pain, an Ulcer, or a mortified Inflammation in the Foot or Arm, frequent tremblings and failings, though short, in the Brain, to have been induced. Whilst that the conceived inordination of the spirits, is transferred from the distemper'd part, thorow the Nerves into the Brain, a certain Formication or tingling, or as it were the ascent of a cold air, is seen and perceived; wherefore the cause of this Distemper is commonly ascribed to Vapours, arising up to the Head: which error we have elsewhere sufficiently confuted. Further, many are wont, when they have fasted, or stayed long beyond their hour of dineing, to have a dimness before their eyes, and their heads to have a turning; and then afterwards those clouds vanish, having eaten a little; this does not so happen (according to the vogue of the people) for that wind or vapours ascend to the Head, from the empty Stomach, which the aliments being taken in, do immediately suppress; but because the Fibres of the Ventricle, and the nervous Filaments or little strings, being destitute of the nervous Juice, with which they desire to be watered, are wont to enter into corrugations or wrinklings, and light Convulsions, which kind of Convulsions and disorders of Spirits, for that they are continued thorow the passages of the Nerves, into the Brain, produce the Vertiginous Distemper; which, as soon as the Fibres of the Stomach remit their wrinklings, ceases of its own accord. For this reason I have known some, by a Vomit being given, tearing the coats of the Ventricle, to have been taken with a cruel *Vertigo*: yea I do suspect, that this Distemper does sometimes arise from meats of ill digestion, and ungrateful to the stomach.

2. Or by reason of an inordinate recourse, or flowing back of the Spirits towards the Brain.

Not by reason of vapours, elevated from these parts is it excited.

But the *Vertigo* is not only a *symptom*, but sometimes a primary Disease of it self; whose nature, that we may the better search into, we ought to inquire into its subject, the formal reasons, and causes of it; and then these being found out, and truly unfolded, we will proceed to its prognostick and Cure.

Without doubt the immediate subject of the *Vertigo* are the Animal Spirits, which every one labouring with this Disease finds to be greatly disturbed, and wandring up and down; but the mediate subject are those parts of the Brain, in which the Imagination and common sense reside, and whence the next way lies into the nervous Stock. These are the Callous and streaked bodies.

The immediate Subject of the Vertigo is the Animal Spirits.

For indeed, the Animal Spirits love to expatiate themselves, and to be expanded or stretched forth on every side, within these medullary places, as in a most ample Field, and pleasant Garden; wherefore like beams of light, with a full and streight ray, they pass thorow all the Pores and most thick passages of the marrow: hence it is, that whilst they gently flow in one line, from the outmost border of the Callous body (to wit, from the streaked bodies, and turnings and windings of the Brain) towards its middle part, they represent pleasant imaginations and phantasies; and whilst in another line they flow forth, perhaps thorow other passages from the middle of the Callous body, into the infoldings or windings about of the Brain, they transferr thither signets or marks of notions for the Memory; and then, whilst they tend into the streaked bodies, and the beginnings of the Nerves, they actuate all the moving parts, and carry to them, as often as there is occasion, the instincts of the motions they are to perform.

The mediate the Callous Body.

But in the *Vertigo*, these equal emanations of the Spirits, as it were rays of light, seem to be intercepted, and diversly perverted in various places; because some bands or handfuls of the Spirits are obscured, others are bended another way, and moved hither and thither into turnings round and whirling about, and oftentimes snatched transverse, or cross one another. Wherefore, confused phantasms, wandring and incon-

Its formal reason.

ſtant images, or actions of ſenſible things are repreſented, in the Brain, by reaſon of the Spirits ſo diſturbed: Then foraſmuch as the irradiation into the nervous ſtock is leſſened or hindred, a dizzineſs and failing of the motive function follows.

If that we ſhould yet further inquire into what hinders or obſtructs the ways, whereby the Spirits are compelled thus to go aſide, or tumultuate within the Brain; it ſeems probable, that theſe inordinations of theirs do depend upon a two fold cauſe, *viz.* firſt, that certain fierce and extraneous Particles, being entred deeply into the Brain, together with the nervous Juice, ſtick cloſe to the ſpirits, and move them into enormous motions; but this, as appears from common experience, happens to every one, on the immoderate drinking of Wine or Strong-waters, or the unaccuſtomed taking of *Tobacco*, by the eating of ſome Vegetables, or being anointed with *Mercury*; for that ſome Heterogeneous bodies and infeſtous to the Spirits, follow them, and are ſnatched with them, even to the middle part of the Brain: why may not ſuch kind of Morbific particles and Vertiginous be ſupplied from the Blood, and other humors very much vitiated, and inſinuated into the inmoſt conclave of the Brain? Then ſecondly, we may ſuſpect, that when the ſerous ſoulneſs doth by degrees creep forward with the nervous Juice, and at length penetrated deeply, that it doth contaminate theſe pure marrows, and greatly ſtuff up its Pores, ſo that the Animal Spirits do not ſhine or beam forth with a clear and full light, but with a weak, broken, and as it were with many ſhadows mingled or interſperſed with it.

Its Conjunct Cauſe.

1. From the perturbation of the Spirits.

2. From their ways or paſſages being obſtructed.

In an habitual *Vertigo*, and inveterate, it ſeems to be plain, that the Conjunct Cauſe doth contain both theſe, from the proof, and that not light, taken from things that are hurtful and helpful: For I have obſerved in many, that this affection or Diſtemper hath been altered, much for the worſe or for the better, upon two occaſions; for whatſoever things being inwardly taken, that beget turgid particles, and apt to grow too hot and rageing, as Wine, Strong-waters, ſpiced, pepper'd, and flatulous or windy food, always hurt thoſe troubled with the *Vertigo*: and for the ſame occaſions, no leſs hurtful are thoſe things, by which the brain is filled, and more ſtuffed, as Surfeits, ſleeping at Noon, or overlong in the Morning, the Southern wind, a cloudy, thick, and moiſt air, a low and watry habitation; on the contrary, the ſame perſons are much helped, as they eaſily perceive, by a ſlender and light dyet, alſo by a clear air, and an open ſoil, where the wind has a thorow paſſage.

This is ſeen by things helpful and hurtful.

Thus much concerning the ſubject, the formal reaſon, and the conjunct cauſe of the *Vertigo*; now in the next place, let us inquire into its *Procatartick*, or more remote leading cauſe; by reaſon of whoſe morbid proviſion or prediſpoſition, theſe two evils are wont to be induced on the ſpirits inhabiting the middle part of the Brain: But here we apprehend both the Brain it ſelf, with the watering Liquor, and alſo the Blood with its infected humors to be in fault.

The more remote foregoing cauſe of the Vertigo *conſiſts both in the vice of the Bloud, and of the Brain.*

The vice of this is moſt often, that it turns from its right temper, into a ſour, acid, and otherways vicious diſpoſition, and being degenerate, perverts the nouriſhing Juice; and alſo gathers in its boſom a Serum, and filthineſs of diverſe kinds, which it is ready to pour forth into the Head. But there are many evident cauſes, to wit, an evil dyet, and errors in the non-naturals, alſo the Scurvy, a long or malignant Feavour, and other Diſeaſes going before, by reaſon of which the Blood becomes ſo full of ill humors, and ſo hurtful to the Head.

The Reaſon of the former explained.

In the mean time, the crime of the Brain is, for that its temper is humid and weak, its frame looſe and infirm, with its Pores too much open and gaping, more than they ought, ſo that all the heterogeneous, ſtrange, and elaſtick Particles, together with the ſerous, or otherways diſeaſed remements, being poured forth from the Blood into the Head, are eaſily admitted into the Brain, together with the nervous Juice; and becauſe of its more open Pores, fall down without any let or ſtop into the middle part, *viz.* the Callous and ſtreaked Bodies. This kind of too diſſolute or looſe habit of the brain, is in ſome innate and originally; further, thoſe who are of a tender conſtitution, to wit, delicate, ſoft, and luxurious Men and Women, whoſe ſpirits are not able to ſuffer any thing ſtrongly, eaſily contract a Vertiginous Diſtemper, or rather increaſe it; to wit, becauſe when the ſpirits of the Brain cannot reſiſt the incurſions of ſtrangers, they give way to every matter that is drove to them: but in others, though ſtrong, inordinate feeding, a ſedentary life, frequent ſurfeiting, alſo intemperate ſleep, and ſtudy, an inveterate Scurvy, evil groſs humors, a long Feavour, and other diſeaſes of the Head, do very often cauſe this kind of evil diſpoſition of the Brain.

The vices of the Brain noted.

From what hath been ſaid, the differences of this Diſeaſe are eaſily gathered; for that I may paſs by what we but now mentioned, that it was either a primary Diſtemper

The differences of this Diſeaſe.

ſtemper of it ſelf, or ſecondary ariſing or depending upon others: further we noted, that the primary *Vertigo*, ſo it were light and not deeply rooted, was only troubleſome with fits excited from an evident cauſe; ſo that oftentimes the diſtemper'd are well enough, but by reaſon of their evil manner of living, or other accidents they become *Vertiginous*; but ſometimes this Diſtemper becoming habitual, they are found to be obnoxious to it almoſt at all times. Secondly, As to the ſeat of this Diſeaſe there is a notable difference; for this is ſometimes more outward as is ſeen happening in the Callous body, and hath almoſt only the tumults and failings of the Spirits, and the wandring, inconſtant, and often confuſed acts of notions and ſenſe, in the forepart of the Head; but ſometimes the Morbific matter falling down more backward, about the ſtreaked bodies, ſtirs up the *Scotomy*, or turning of the Head, and a loſs or failing of the motive function, that oftentimes the Eyes are darkened, and they reel or ſtumble, and their Legs fail them.

As to the *prognoſtick* of this Diſeaſe, the *ſymptomatick* or accidental *Vertigo*, yet almoſt all the others, while freſh, are free from much danger, and are eaſily to be Cured. *Its Prognoſtick.*

But the habitual, and almoſt continual, although great danger and ſuddenly to fall is rarely threatned; yet becauſe it admits of only a difficult and long Cure, it ſo tires out both the Patient and the Phyſician, that before the Diſeaſe can be Cured, they both become weary of one another.

The primary *Vertigo* being placed before, or more outward, which hath ſcarce a darkneſs or falling accompanying it, is more ſafe, and healable, but is often changed into an inveterate Headach, and ſometimes alſo it is cured of it ſelf, by an *Hæmorrhage*, or bleeding at the noſe, or by a flowing down of the *Hæmorrhoids*; it is alſo oftentimes taken away by Medicine.

The *Vertiginous* Diſtemper, ariſing behind, and intercepting the beamings forth of the Spirits into the Nerves, is far more dangerous, and oftentimes paſſes into an *Apoplexy*, or a *Palſie*, or into Convulſive Diſeaſes.

There does not properly belong to the *ſymptomatick Vertigo* any Curatory Method. There it is only needful to joyn ſome *Cephalick* Remedies, diſcuſſing the clouds of the Brain, and quieting the diſorders of the Spirits, to thoſe other primary indications; or rather that we may ſpeak to the capacity of the vulgar (which ought to be done ſometimes, though feignedly) let ſome Medicines contrary to Vapors be added. *The Cure of the Vertigo.*

The accidental *Vertigo*, or any other freſh or newly taken, may be healed with *Phlebotomy*, and a gentle Purge, and ſometimes iterated: but that the Diſeaſe may be more certainly extirpated, let there be beſides adminiſter'd carefully *Cephalick* Remedies, ſuch as are anon deſcribed.

For the Cure of an habitual *Vertigo*, and become inveterate, there ought to be inſtituted almoſt the like method, as is againſt moſt other *Cephalick* Diſeaſes, which ſuggeſts theſe three chief intentions of healing, *viz.* in the firſt place muſt be endeavoured that the root or neſt of the Diſeaſe may be cut off, and that the brain may remain free from any new flowings in of the Morbific matter; for which end a right order of dyet being commanded, ſometimes letting of blood, and moſt often a gentle Purge in the intervals are convenient. Let a dry and open air be choſen, let immoderate and untimely ſleep and ſtudy be ſhunned, let morning and evening draughts be wholly abſtained from; in the place of the former, let a draught of *Tea* or *Coffee*, with Sage leaves boiled in it, be given. Let an Iſſue be made in the Leg or Arm, and ſometimes let the *Hemorrhoidal* Veſſels be kept open with Leeches; let the diſtemper'd riſe early in the morning, and waſh every day the fore-part of his Head with water, and alſo his Temples, and rub them with a courſe cloth. *There are three chief intentions of healing;* 1. *To take away the root or feeding of the Diſeaſe.*

Secondly, The ſecond curatory intention is, to take away the *Procatartick* or more remote foregoing cauſes; wherefore, endeavour that both the *Dyſcraſie* or evil diſpoſition of the Blood may be removed, and alſo that the weak and too looſe conſtitution of the Brain may be mended: For the former, altering remedies chiefly are convenient, as temperate *Antiſcorbuticks*, and ſometimes *Spaw* Waters, or Whey. To which always may be added for the latter indication, *Cephalick* Medicines, to wit, ſuch as are prepared of Coral, Amber, humane Skull, the root of the *male Peony*, Muſſeto, the dung of a Peacock, and the like, the forms of which we ſhall ſhew you by and by. 2. *To remove the procatartick cauſes.*

The third Intention, which is properly curatory, endeavours to take away the Conjunct Cauſe of this Diſeaſe; which however the Procatartick Cauſes being removed, for the moſt part ceaſes of it ſelf; for if the coming of every extraneous Matter into the Brain be cut off, there will remain nothing but pure and clear Spirits, and they having gotten open and free ſpaces, within the Callous Body, will from thence 3. *To take away the Conjunct Cauſe.*

thence flow forth on every ſide: However, for the ſcope of healing this, you muſt proſecute it with the former; with Medicines indued with a volatile ſalt, whoſe particles being very ſubtil and active, do refreſh the Animal Spirits, of which ſort are chiefly Spirits of Harts-Horn, Sut, of *Sal Armoniack*, *&c.* impregnated with Amber, and humane Skull, Tinctures of Coral, Amber, Antimony, Elixir of *Pœony*, *&c.*

The Curatory Method is ſhewn.

Theſe things being premiſed, concerning the *Vertigo* in general, it will ſeem to the purpoſe, to draw or ſhadow forth the Curatory Method particularly, and as it were to direct you by a thred: and in the firſt place is ſhewn what is to be done for the Cure in the fit, and what out of it, for prevention.

1. As to the firſt, although the invaſion of the *Vertigo* ſeem cruel, it is for the moſt part without danger, and eaſily paſſes over of its own accord; In ſuch a caſe, if the Pulſe ſhews it, let Phlebotomy be made uſe of, after having given a Glyſter; but becauſe the ſick think themſelves dying, and expect medicinal help, in that caſe let there be Bliſters made in the Neck, and ſtinking things held to the Noſe, as *Caſtor*, the Spirits or Salt of Harts-horn, or Urine, or of *Sal Armoniack*. Further, let theſe Spirits be given twice or thrice a day with a convenient Doſe of *Cephalick Julep*: going to ſleep, let them take a *Bolus* of *Mithridate*, with the Powder of *Caſtor*: let them take the next day, if the Diſtemper doth not yet vaniſh, a light Purge, or if the ſick be prone or eaſie to Vomit, an *Emetick*, than which a better Remedy can ſcarce be taken.

Take *Pills of Amber twenty five grains, of the Reſine of Jalap ſix grains, of Tartar Vitriolated ſeven grains, of the Balſom of Peru what will ſuffice to make four Pills, to be taken going to bed, or early in the morning.*

Or Take *of the Sulphur of Antimony five grains, of the Cream of Tartar half a ſcruple, of Caſtor ſeven grains; make a Powder: Let it be taken with care, expecting to Vomit.*

Why vomiting Medicines are ſo much noted in this, and other Diſeaſes of the Head.

That Vomiting Medicines do oftenеſt help in the *Vertigo*, beſides the teſtimony of Authors, appears plain enough alſo from common obſervation; and beſides, ſince thoſe troubled with the *Vertigo* do often Vomit of their own accord, many have been of the opinion, that the cauſe of this Diſeaſe moſt commonly lyes hid in the ſtomach; but it is much otherways, and as we have elſewhere ſhewed; Vomiting frequently follows upon the Spirits being diſturbed in the Brain: But that Vomits help much in this Diſeaſe, the reaſon is, becauſe this kind of Phyſick cauſes a great revulſion of the humors from the Brain, and very much reſtrains the Spirits tumultuating in it. When the Membranes and Fibres of the Ventricle, and Viſcera planted nigh them, are pulled; various humors, *viz.* the *nervous*, *ſerous*, *watery*, *pancratick*, and *cholerick* are drawn into thoſe parts, and ſo ſqueeſed forth, ſo that the Head being freed from their flowing to it, doth eaſily ſhake off from it many impacted there before: then as to the Animal Spirits, we have ſhewed ſomewhere, that there is a moſt intimate commerce, and agreement between thoſe inhabiting the ſtomach, and thoſe dwelling in the Brain; to wit, that therefore the grateful or ingrateful affection of the Ventricle, from things taken into it, might bring rejoycing or dejection to the Spirits dwelling in the Brain. *Opiates* whilſt they lye in the ſtomach cauſe ſleep; in like manner, it doth not a little help in the *Vertigo*, and other *Cephalick* Diſeaſes, whereby the Spirits of the Brain wandring up and down, and agitated enormouſly may be repreſſed, and returned into order; if their Companions or Kindred be ſtriken down, by the working of the Medicine; becauſe whilſt many are called forth from the Brain, to their aſſiſtance; the others remaining, remitting their diſorders, reſume their wonted offices or functions: without doubt it is for this reaſon chiefly, *Emeticks* bring ſo often help in the Diſtemper of madneſs; ſo that *Empericks* do almoſt only uſe them.

What is to be done out of the Fit, for prevention ſake.

2. But to return from our digreſſion, let us conſider what is to be done for the Curing of an inveterate and almoſt continual *Vertigo*, out of the fit. Therefore, firſt a method being inſtituted concerning bleeding, and purging, according to the conſtitution and ſtrength of the Patient, and after reſt, to be repeated; let a Vomit alſo, by my advice, be taken once a month (if nothing to the contrary hinders it) for which end let there be given to the weaker, after the ſtomach is filled with ſlippery Meats, Wine, and *Oxymel* of Squils, to about two or three Ounces, and after it let a great quantity of Poſſet-drink be drunk, with *Cardum* boiled in it, that the Patient may vomit of himſelf, or by provocation. To others may be given an Emetick of the Salt of *Vitriol*, or the Sulphur of *Antimony*, or of the infuſion of *Crocus Metallorum*:

lorum: as concerning Iſſues, Bliſterings, the bleeding at the *Hemorrhoidal* Veins, Plaſters, or quilted Caps to be worn upon the Head, or other Topicks to be applied to the ſoals of the Feet, or to the wriſts, for revulſion or derivation ſake, let the Phyſician deliberate.

Take *of the Conſerve of the Flowers of the male Pœony ſix ounces, of the Powder of its Root one ounce, of the Seeds of Pœony powder'd two drams, of Amber, Coral, Pearls powder'd, of each two drams and a half; of the Salt of Coral one dram, of the Syrup of Coral, what will ſuffice to make an Electuary: the Doſe is one dram and an half, or two drams, Evening and Morning; drinking after it of the following diſtilled water three ounces.* *Electuary.*

Take *of the freſh leaves of Miſleto ſix handfuls, of the root of the male Pœony, and of Angellico, each one pound and an half; of the whiteſt dung of the Peacock two pound, of Cardamoms bruiſed two ounces, of Caſtor three drams; all being cut ſmall and mixt together, pour to them eight pints either of White Wine, or Whey, made of it: Let them be diſtilled in fit Stills, and the whole liquor mixed together.* *A diſtilled Water.*

Take *of the Powder of the Root of the male Pœony half an ounce, of red Coral prepared, of Species Diambræ, each one dram and a half; of the Powder of the Flowers of the male Pœony freſh bruiſed and dryed in the Sun, one dram: make a Powder, to which add of the whiteſt Sugar, diſſolved in the water of Pœony, and boiled to the conſiſtence of Tablets ten ounces: of this make Lozenges according to art, each weighing half a dram; eat one or two of them often in a day.* *Tablets.*

Becauſe all things are not convenient to all Men, and that the *Phyſician* ought to try diverſe Medicines, and inſtitute various methods, and to try now this, now that, therefore we ſhall here add ſome other forms of another kind.

Take *of our Syrup of Steel ſix ounces, and drink a ſpoonful of it in the Morning, and at five in the Evening, with the diſtilled water, but now deſcribed, or any other Cephalick, to the quantity of three ounces; or take of our Tincture of Steel, from fifteen to twenty drops, in a draught of the ſame diſtilled water, twice in a day. I have known this to have given notable help to many.* *Chalybeats or Steel-Medicines*

Let there be given daily after the ſame manner, Doſes, ſometimes of the Spirit of Sut, Harts-horn, or of Sal Armoniack, impregnated with Coral, Amber, or the Skull of a Man: or of the Tincture of Antimony, Amber or Coral. *Spirits.*

Take *of the Powder of the Root of the male Pœony one ounce and an half, of the Seeds of Pœony, Coral prepared, and of the whiteſt Amber, each three drams; of Pearls prepared, of the Powder of the Flowers of the male Pœony, freſh bruiſed and dryed in the Sun, of each two drams; of Sugar-Candy one ounce: make a Powder, and take one dram twice in a day with a draught of Tea or Coffee, or a Decoction of Sage or Roſemary.* *Powders.*

For poor people may be preſcribed, *Powder of the leaves of the Apple-tree, Miſleto, dryed in the Sun, and powder'd, to the quantity of a dram, to be taken twice in a day.* Or take *of the whiteſt Peacocks dung ſix ounces, of the Powder of the Flowers of the male Pœony one ounce, of Sugar two ounces: make a Powder, of which let them take a ſpoonful twice in a day, in ſome convenient liquor.*

Let thoſe troubled with the *Vertigo* drink for their ordinary drink, ſmall Ale, with leaves of the Orchard Miſleto boiled in it inſtead of Hops, and in the Veſſel holding about four gallons, let a little bag be hanged, in which put half a pint of Peacocks dung, and three drams of Cloves bruiſed.

Examples of thoſe labouring with the *Vertigo* are ſo frequently met withal and almoſt daily, that there ſeems no need to add here any; but however, that the image or type of this Diſeaſe may be known, I ſhall only mention ſome few and more rare caſes. *Caſes and Examples of the Sick.*

A Divine about ſixty years of age, after he had been troubled for about three months with a light *Vertigo*, or as it were a frequent coruſcation or brandiſhing of the Spirits, in the fore part of the Head, at length the Diſeaſe growing worſe, he became ready to fall, and with a darkneſs before his eyes; in ſo much, that in walking he ſometimes would fall flat on the ground. Being ſent for to Cure him, I preſcribed *Phlebotomy*, with a gentle Purge, and after a little reſpite, to be repeated again; further, I took care to have the *Electuary*, and mixtures given him, ſuch as we noted above, with Bliſtering Plaſters, and other adminiſtrations not to be neglected: A fortnight after, no eaſe following from theſe, I gave him a Vomit of the Salt of *Vitriol*, and the infuſion of *Crocus Metallorum*, by which when he had eaſily vomited ten times, he began to find himſelf better, and by uſing further altering *Cephalicks*, for *The firſt Hiſtory.*

about

about a fortnight more, he became perfectly well, and from that time, for six years, he took yearly spring and fall a Vomit, with some other Medicines; though he continued in perfect health.

The second History. A certain Gentleman about sixty six years of Age, when he had lived for a long time obnoxious to a light *Vertigo*, and that was wont to be excited only occasionally, about the end of the last *Autumn*, labouring more grievously with this Distemper, he also became forgetful. Being sent for to visit this Man, after he had been sick about three weeks, I found him very much changed in his looks and countenance, the vigor of both being diminished. Seeing that he was daily distemper'd towards evening with a small Feavour, his Pulse beating high and vehemently: I first caused blood to be taken out of his Arm, and after six or seven days, out of the *Hæmorrhoidal* Veins; and then I took care for Blisters to be made behind the Ears and hind part of the Neck, and two large Issues between the shoulders: Inwardly, at physical hours, he took daily *Cephalick* Medicines, almost of every kind. Within a months space he seem'd to recover, and began to walk abroad, and to take care of his houshold affairs, and other businesses: but in the beginning of the Winter, taking cold by going daily abroad, he fell into a little Feavour, with a greater perturbation of the spirits within his Head: for becoming every evening delirous, he hardly knew what he said or did. But within seven or eight days, blood being taken away, and a slender dyet used, the Feavour vanished, but the distemper of the Brain was changed from its former state. For the *Vertigo* wholly ceasing, he became very forgetful, and *Paralytick*, in all his right side. As to his Head, being asked, whether it was clear, and free from the dizziness and confused Phantasms; he answered, that as to those things, he never was better in his life: For he well understood his infirmity, knew his Friends and Relations, and others who came to visit him, but could hardly remember the names of any of them; and when he began to talk of any thing, he wanted words to express his mind: Then as to his Distemper in his side, in his right Arm and Leg; there was not only a loosning wholly, and a want of motion, but in either there grew a great white watersh Tumor, in so much that not only the Cure, but his life was despaired of, to be long prolonged; yea, the Magistracy and Offices which he held, were sought for by others.

However I did not desist from my curatory work, the most skilful Physician Doctor *Wharton* being called to my assistance. Carefully administring to the sick by our joint counsels, we prescribed solutive Pills to be taken at times, and in Medicinal hours on other days *Cephalick*, *Antiscorbutick*, and *Antiparalytick* Remedies: His head being shaven, we ordered a Plaster of Gumms and Balsoms to be laid upon it, and the loosened parts to be anointed with Oyls and Balsoms, and to be strongly rubbed. Whilst these things were doing, with some success as to the greater clearness of his intellect, I know not from what cause, he fell into a Feavour, in the midst of the Winter, so that for several days and nights, he grew extreamly hot, with burning, great thirst, and interrupted sleep; his tongue being scorch'd, and having a white scurf, his Pulse was high, his Urine red, and full of contents. We abstained from *Phlebotomy*, by reason of his Age and *Palsie*, and especially because of the Dropsie begun in the distemper'd side: but with a slender dyet prepared of Barly Broths, and Grewel, we order'd him day by day *Juleps*, *Apozems*, and other Remedies moving Sweat and Urine; and when about this time the Issues between his shoulders flowed very much, the sick man began to grow better as to his Memory, and Palsie, and from thence profiting daily, and by degrees growing well, of both his distempers, together with his Feavour, he was restored to perfect health within a fortnight, and is still living in health.

The Reason of the Cast described. In this sick man there was a notable motion, and a various change or translation of the Morbifick matter; for what was at first in the middle part of the Brain, *viz.* sitting on the Callous Body, stirred up the cruel *Vertigo*; the same afterwards increased, and (as it is probable) being further diffused into the infoldings of the Brain, brought forgetfulness or oblivion to the former Distemper: Then forasmuch as the same matter being moved by the Feavour, and a little discussed, falling partly on one of the streaked bodies, brought the Palsie of one side, and being partly expulsed into the compass of the Brain, almost took away the Memory, the *Callous* Body in the mean time obtaining a clearness; and lastly, it was not without the help of the other Feavour, that the Morbifick matter being discussed from these two last nests, was wholly carried away, the sick being restored to health.

The third History. Lately being tired out with the continual complaints of a certain man, troubled with the *Vertigo*, after many other Remedies tried in vain, I prescribed at length, that for the space of a month, he should take daily, twice a day, about a spoonful of the

the following Powder, drinking after it a draught of the Decoction of Sage or Rosemary, impregnated with the Tincture of Coffee.

Take *of the Powder of the Roots of the male Pœony two ounces, of the Flowers of the same bruised and dryed in the Sun one ounce, of the whitest dung of the Peacock half a pound, of white Sugar two ounces; make a Powder.*

It is scarce credible how much help he received from this Remedy; visiting me after a month, he seem'd a new and another man; being freed of the *Vertigo*, he not only confidently walked about, but was able to take care of his houshold affairs, and to meddle with any hard business, which he was not able to do before.

CHAP. VIII.

Of the Apoplexy.

The Seat of the Apoplexy.

AS the seat of the *Vertigo*, so also of the *Apoplexy*, seems to be within the same more inward cloyster of the Brain, *viz.* the *Callous* Body; to wit, because in either Distemper, although in a far different degree, the imagination and the common sense are affected, *viz.* in the first, the irradiation of the Spirits is wont to be obscured in some places, and as it were broken with interspersed shades; but in the latter, the same is wholly darkened, and suffers a full eclipse.

A Description of the Disease.

The word *Apoplexy* denotes percussion, and by reason of the stupendous nature of the Disease, containing as it were something divine, it is called a *Sideration* or Blasting; for those taken with it, being as it were Planet struck, or with an invisible *Numen*, fall suddenly to the ground, and being deprived of sense and motion, and the whole animal function ceasing (unless that they breath) they lye a long time as if dead, and sometimes yield to death; But if they revive, oftentimes they are taken with an universal Palsie, or else of one side.

Its Subject.

The immediate subject of the *Apoplexy*, and the nearest, are the Animal Spirits inhabiting that region of the Brain where the principle faculties of the knowing or understanding soul reside, to wit, the *Callous* Body: but we conclude the mediate subject, to be the middle part of the Brain; because from hence, the instincts of all spontaneous motions proceed, and in this, the perceptions of all sensible things are terminated: by what means the *Cerebel* and *Præcordia*, and all the other parts both Animal and Vital, are secundarily affected, we shall shew anon, when the *symptoms* of this Disease and their reasons are delivered. Upon the coming of the *Apoplectick* fit, all the acts of every spontaneous and knowing function (to wit, which depend upon the brain it self) are forthwith hindred and cease; the reason of which is, because the Animal Spirits being suppressed in their chief place of meeting, to wit, the *Callous* Body, both their next motion of expansion in that place, as also their flowing forth into the nervous appendix, is wholly defective: For therefore, by reason of such an eclipse of them in that place, an immediate and an universal darkness is caused in the whole animal region, which is under this government: yet in the mean time, the Pulse and respiration, as also the motion of the Ventricle and Intestines, are after a sort performed, either perfectly and freely, or at least interruptedly and with pain; forasmuch as their actions proceed wholly from the *Cerebel*, which is not at all, or but little hurt by the Morbifick matter.

The spontaneous Functions only deficient in the Apoplexy.

The opinions of others concerning this Distaste.

But it will seem difficult to be explained, after what manner, and from what causes, the Animal Spirits are so suddenly, and all at once suppressed, and as it were extinguished, about their first spring of emanation; so that all sense and motion depending thereon ceases every where. Concerning this, there are many and diverse opinions of Authors; whilst some place the cause of the *Apoplexy* in the Heart, and others in the Brain; then some lay the fault on the intemperance of that, and others on the evil conformation of this. Further, the obstruction of the Brain is said by some to cause the *Apoplexy* in the greater Ventricles, by others in its Pores or lesser passages: then the obstruction being taken for the cause of the Disease, and wholly binding up the lesser Pores of the Brain, is said to excite the fit, either because the afflux of the bloody for the begetting of Spirits is hindred from those parts; or because

cauſe, the flowing forth or emanation from thence, of the Animal ſpirits is kept back. It would be a tedious thing to examine the opinions of every one, and to conſider the weight of their reaſons.

The Theory of this Diſeaſe is beſt ſhewn by the famous Dr. Webſter.

The *Theory* of this Diſeaſe ſeems to be very exactly delivered by the famous *Webſterus*; for in the firſt place, for the finding out of its ſo abſtruſe and hidden cauſes, he brings Hiſtories or *Anatomical* obſervations, in which the *Phenomena* are declared in many dead Carcaſes of thoſe dying of this Diſeaſe; to wit, in three ſtruck or blaſted, he had found the blood extravaſated or out of the Veſſels here and there in great cladders, and had largely marked the ſubſtance of the Brain; in another the Serous Colluvies had overflowed the whole head, both without and within the Skull. From theſe footſteps of this moſt hidden Diſeaſe thus detected, the Author concludes, "That the principal places affected are not the greater Ventricles, but the middle marrowy ſubſtance of the Brain and Cerebel, which is every where porous, and indued with very ſmall paſſages, both that the vital ſpirits may flow in thither from the blood, and that the animal may flow forth: But indeed he affirms, That the whole cauſe of every *Apoplexy* doth conſiſt in theſe two, *viz.* either in one of them, or both of them together: to wit, either becauſe the flowing of the blood thorow the Arteries to the Brain is deny'd, or elſe by reaſon that the flowing forth of the Animal Spirit from the Brain and Cerebel, thorow the Nerves and ſpinal Marrow, is prohibited; or for both theſe cauſes together. As to the former, he propoſes a threefold means, whereby the blood may be hindred; *viz.* Firſt, Either by reaſon of the obſtruction of the inner *Carotid* Arteries, and of the *Vertebrals*, to wit, which happens in the greater Veſſels, and chiefly about the aſcent of the Brain, from the blood concreted into cloddery pieces; or in the leſſer Veſſels, which paſs thorow the brain from a Viſcous Matter planted in them: Or, Secondly, the flowing in of the blood is detained from the brain, by reaſon of the compreſſion of thoſe Veſſels, which ſometimes happens, becauſe the *Pariſthmia*, or Kirnels of the hinder part of the Neck, do ſo ſwell up, from a ſerous heap of watry Humors, that by preſſing together the Arteries paſſing thorow, ſhuts forth the paſſage of blood to the Head. Or, Thirdly, The bloody flood may be hindred, becauſe a Veſſel being preternaturally opened within the Skull, great quantity of blood is poured forth, which ſhould otherways go to the benefit of the brain. As to the other cauſe of the aſtoniſhing Diſeaſe, *viz.* from the flowing forth of the Spirits being hindred, he affirms that may be cauſed by two ways; to wit, either by reaſon of the obſtruction of the beginning of all the Nerves, cauſed by a ſerous inundation, or by a ſudden compreſſion of the ſame; which is cauſed either by an heaping up of too much blood in the *Meninges*, or in ſome parts of the brain it ſelf, or in its Ventricles; or elſe by a diſpoſition of the *Phlegmonodes*.

Another Reaſon given by the Author.

Theſe moſt ingenious reaſons indeed ſeem to challenge our aſſent, for that more probable or more likely are not eaſily to be brought; but becauſe we think ſome of theſe are to be altered, and others to be added, therefore we ſhall here inſtitute, though not a different, yet ſomewhat another reaſon of this Diſeaſe.

The Excluſion of the Blood from the Brain does not eaſily happen;

And in the firſt place, though we grant that the flowing in of the blood, may be ſometimes denyed to the Brain; yet we do not believe, that it only happens after the aforeſaid ways, nor that, for that reaſon, the *Apoplexy* doth ariſe. We have elſewhere ſhewed, that the *Cephalick* Arteries, *viz.* the *Carotides*, and the *Vertebrals*, do ſo communicate one with another, and all of them in ſeveral places, are ſo ingraffed one in another mutually, that if it happen, that many of them ſhould be ſtopped or preſſed together at once, yet the blood being admitted to the Head, by the paſſage of one Artery only, either the *Carotid* or the *Vertebral*, it would preſently paſs thorow all theſe parts both exterior and interior: which indeed we have ſufficiently proved by an experiment, for that Ink being ſquirted in the trunk of one Veſſel, quickly filled all the ſanguiferous paſſages, and every where ſtained the Brain it ſelf. I once opened the dead carcaſe of one waſted away, in which the right Arteries, both the *Carotid* and the *Vertebral*, within the Skull, were become bony and impervious, and did ſhut forth the blood from that ſide, notwithſtanding the ſick perſon was not troubled with the aſtoniſhing Diſeaſe; wherefore, it may be doubted, whether the blood excluded from the Brain, by reaſon of ſome Arteries being obſtructed or compreſſed, doth bring forth this Diſeaſe. Certainly there is more of danger, that the cauſe of the *Apoplexy*, ſhould be from its too great incurſion and extravaſation within the Brain, as it was in the three *Apoplectick* people, cited by the Author; and that not only, becauſe the marrowie ſubſtance of the Brain was deprived of the Blood coming to its uſe, (for ſuch a defect might have been ſupplied by the other Veſſels, extending their branches every where) but rather, becauſe by the extravaſated Blood, and

Becauſe all the Arteries communicate one with another, and ſome of them ſupply the defects of the others.

not

not ſeldom being concreted into an hard and mighty bulk, the marrow of the Brain is preſſed together, the paſſages of the Spirits being by that means ſhut up.

But indeed, though we deny this to the afflux of the blood into the Brain, being hindred in any part only, yet it may be granted to its total excluſion, for therefore we have often noted, a want of all motion to be cauſed: which Diſtemper however hath been rarely taken for the aſtoniſhing diſeaſe, but rather is wont to be called a *Syncopy*, or Swooning away, or the *Hyſterical* Paſſion: If at any time the motion of the Heart be wholly ſuppreſſed, preſently, the Blood being retained without the Brain, the Animal Spirits fall down, even as the light vaniſhes when the flame is put out.

A total Excluſion of the blood from the Brain ſometimes happning, cauſes a terrible Syncopy.

The action of the Heart is ſtopped or hindred, either by reaſon of the improportionate flowing in of the Blood, as in the violent paſſions of fear or ſadneſs, or by reaſon of the Animal Spirits, which ſerve for its motion, being denyed by the Cerebel. This we think to happen ſometimes, becauſe of the *Cardiack* Nerves being Diſtemper'd with a Convulſion, or otherways bound together, after which manner it is uſual in Convulſive and *Hyſterical* Paſſions; ſometimes for the outward parts, as the Arms and Legs, and ſometimes the Inward, to wit, the Prærcordia and Viſcera, one after another to be affected: but a want of motion follows the inordinations of theſe, in which the ſick lie for ſome time without motion or ſenſe, with a ſmall or ſeldom beating Pulſe as if dead. Which indeed ſo ſeems to come to paſs, by reaſon of the Cardiack Nerves being contracted at that time, and ſo the Spirits which were about to flow being ſuſpended; though we believe ſuch a want of motion ſometimes to be produced by the mere confuſion of the Spirits within the Brain, but in this caſe, the heart it ſelf is lively enough moved, and the Pulſe is alſo ſtrong and laudable.

This depends oftenеſt on the motion of the heart, being hindred, and ſo either becauſe of the Cardiack Nerves being bound together;

But beſides, it ſeems moſt likely, that the motion of the Heart is often ſuppreſſed or inhibited, by reaſon of the Animal Spirits, deſtinated to the vital function, being ſuppreſſed in the fountain it ſelf; to wit, within the Cerebel. We have mentioned this to be done in the Diſtemper of the *Incubus*: but without doubt it ought to be attributed to this cauſe, for that I have obſerved in ſome, a failing of the Spirits, with a ſudden privation of all the Animal functions to follow, upon a great weight in the hinder-part of the Head, in which the ſick become ſenſeleſs and immoveable, with the Pulſe and breathing very much leſſened, and ſcarce perceivable, and lye quite cold for many hours; yea oftentimes, a day or two, more like dead than living perſons. I have known ſometimes thoſe diſtemper'd, to be ſtiff and cold, Pulſe and breathing to be thought quite gone, and to be indeed eſteemed quite dead, and put into their Coffin, yet after two or three days to have reviv'd again: but whoever awakes out of this fit, whether it be of ſhort or long continuance, does not for that reaſon fall into a Palſie, or half Palſie of one ſide, as thoſe for the moſt part do, who are diſtemper'd with the *Apoplexy*. Further, no doubt but that many die from ſuch a Morbific cauſe, whoſe death wrongfully hath been aſcribed, either to the mortal *Syncopy*, or to the *Apoplexy* properly ſo called. Truly the caſe afterwards deſcribed, can only have the like reaſon given for it. Wherefore, though it may ſeem a *Paradox*, yet it is not incongruous to reaſon, that we affirm, that there is a twofold *Apoplexy*, one in the *Cerebel*, which we but now deſcribed; the other ſeated in the middle of the Brain, into the cauſes of which, and the manner of it, we ſhall now inquire.

Or, By reaſon of the Spirits in the Cerebel, being hindred from their flowing into the Nerves.

Hence there is a twofold Apoplexy, one in the Brain, the other proper to the Cerebel.

But here in the firſt place we muſt diſtinguiſh concerning the various aſſault or fit of this Diſeaſe, to wit, foraſmuch as ſometimes being excited, without any previous diſpoſition, or *Procatarxis*, from a ſudden and ſolitary cauſe, it is often invincible, and for the moſt part mortal; againſt this there can be no preventive method of healing, or preſervatories inſtituted; and the Curatory method which is wont to be taken, proves very oft ineffectual. Or, Secondly, the *Apoplectick* fit having an antecedent cauſe, or previous *Procatarxis*, is brought into act by reaſon of various occaſions, or evident cauſes.

The Theory of the former delivered.

This Diſeaſe either accidental, or habitual.

As to what belongs to the blaſting, or being ſtricken, of the former kind, to wit, ſuddenly and unthought of, its conjunct or next cauſe is, either a great ſolution or breach of the unity, happening ſome where within or near the middle of the Brain, by reaſon of which its Pores and paſſages being obſtructed or preſſed together, the whole emanation of the Spirits is ſuppreſſed: or elſe it is an huge and ſudden profligation of the Spirits, or an extinction of thoſe dwelling in the Brain. We ſhall ſhew the formal reaſons of both of them particularly, and the ſeveral ways of their being affected.

The cauſe of the former is, either a great breach of the unity in or near the middle of the Brain;

Or a ſudden ſtupefaction or extinction of the Spirits.

Extravaſated Blood, the breaking of an Impoſthum, and a great flood of Serous humor plentifully flowing forth, are wont to effect the greater breach of the unity within the Brain.

1. *A Solution of the unity, either from blood let forth of the Vessels; Or,*

From Blood effused or extravasated within the Brain, and there either growing together in clodders, or striking on the affected places, doth often times cause mortal *Apoplectick* fits, as I my self have proved by *Anatomical* inspection in some others, besides the instances brought by the famous *Webfer*; but such Morbific extravasations of the Blood within the Brain, proceed either from an external cause, as a fall from on high, or by a blow on the Head, or by hitting it against some hard thing, and the like; or from an inward cause, to wit, for that the Blood being sharp and thin, and the little mouths of the Vessels, and the places between being too loose, it growing more than ordinarily hot, either of its own accord or occasionally, and flowing forth thorow these, easily breaks into the soft and yielding substance of the Brain. Further, although we have assigned the seat of this Disease in the *Callous* Body, yet the blood, because effused somewhere nigh or above it; because it compresses the underlying Marrow, by intumifying the distemper'd places, causes the *Apoplectick* fit.

2. *From an Impostbume, or the breaking of an Ulcer; Or,*

Secondly, An Impostbum or Ulcer is rarely wont to be excited within the Brain, but often in the *Meninges*, and almost for the same occasions, by which the extravasation of the blood happens: while it is ripening, it causes only an Headach or heaviness, but when it is broke, the filthy stuff flowing from it, into the shelly part of the Brain, gnaws and putrefies it, and then by degrees instilling its putrid particles, and very infestous to the Spirits, into the middle or marrowie part of the Brain, raises up at last the fit of the astonishing disease.

3. *From a Deluge of the Serum.*

Thirdly, The Serous heap or deluge being poured forth from the blood, into the Head, though rarely or never of it self, yet sometimes by reason of more strong evident causes, runs so suddenly into the Brain, that filling and stuffing soon all its Marrowie Pores, causes astonishment or deprivation of sense and motion: And this I have known to happen to some, from drinking of sharp thin Wine, or *Spaw*-waters, and sleeping upon it; and I have observed the like effect, from a long and total suppression of Urine, also in *Hæmorrhages* (or fluxes of blood) being suddenly stopped: And lastly, the Serous Recrements in malignant Feavours, being translated to the Head, by a critical transposition, often causes a mortal senselessness, or becoming speechless.

An extinction of the Spirits from Opiates, or from immoderate Drinking of hot Waters.

Another kind of evident causes, from which sudden blasting or being smitten is wont to be caused, consists in the sudden profligation or extinction of the Spirits, which indeed doth not seldom or rarely happen, from strong *Narcoticks*, or Medicines causing sleep, and also from the immoderate drinking of hot waters.

The operation of Opiates, as it is assigned by the famous Webfer.

Though we have already discoursed concerning the use and effects of *Opiates*, I cannot however pass over their way of affecting, assigned by that most famous Doctor *Webfer*. This Learned Man affirms, That *Narcoticks* only do too much open and dilate the Pores and passages of the Brain, and as it were open the doors of it, before fast shut, whereby every extraneous and incongruous thing is admitted into the Chamber or sleeping place of the Spirits, together with the subtil liquor poured forth from the blood; and so by a violent incursion, dissipates their ranks and orders. But indeed it appears from what hath been above said, that *Narcoticks* do not only or always operate so; for we have shewn that whilst they are yet within the Ventricle, they often cause sleep, and sometimes death it self: Besides, it should follow from thence, that *Opiates* being often given should bring still a greater evil, because by dilating more and more the Pores of the Brain, they cause a much more easie entrance to all manner of impurities; but truly it is clear enough, that *Narcoticks* are most hurtful at the first time being taken, and afterwards being often taken do little hurt, so that some accustomed to *Opium*, will devour a great quantity of it without hurt; which is certainly a sign, that this doth not so much alter the conformation of the Brain as that it doth immediately agitate or work upon the Animal Spirits; whom at first (because so very improportionate to them) it slays with a mere blast; then afterwards there being a certain familiarity between them, and this Medicine, it disturbs them not.

The formal reason of the habitual Apoplexy.

Thus much concerning the causes of the accidental and sudden *Apoplexy*, which falls indifferently upon all men, though not at all predisposed: for which also there can be no preventive Medicines instituted, and it is rarely that it is cured. But besides, we observe, that this Disease is sometimes habitual, and that it remains as a constant disposition in some men, by reason of which, at first they are exercised only with light skirmishes, but after some time they become more grievous, and of which at last for the most part they dye. Concerning this therefore, we shall inquire, 1. what the Conjunct Cause of this Disease may be, and the formal reason of it. 2. In what the *Apoplectick* Disposition or *Procatarxis* of the Disease consists: Then 3. What Evident Causes it hath.

1. As to the first, we may suppose, upon the coming of the *Apoplectick* fit, that a certain matter before heaped up, and dispersed in the compass of the Brain, at length doth descend into its middle or marrowie part, and there doth assault all the Spirits, and suppress and beat them down in the very fountain of their emanation: Although it doth not plainly appear, whether they effect it either by stuffing only the Pores of the Marrow, or by driving away the Spirits themselves, or by inflicting on them a numness; notwithstanding it is likely, that it may be done by either of the ways. And indeed we say the medullary Pores of the Brain, may be somewhat stopped or obstructed, because the same matter, which at first setling on the *Callous* Body, caused senselesness, being sliden down from thence lower into the *Callous* Body, and then stuffing its Pores, is wont to excite the Palsie of one side. But yet we may not conclude, that the sideration or being struck, doth arise only from the Pores of the Brain being stopped, because then the fit would oftentimes creep on them gently, and by little and little; forasmuch as all the Pores cannot be possessed by the inflowing matter at once, but successively, and some after others. But when as this Distemper leaps upon one suddenly, and like lightning, what can we conceive less, than that the Spirits are struck down as it were by a blast, from the malignant contact of the matter rushing upon them? For it seems, that its particles descending on every side from the compass of the Brain, into its middle part or the *Callous* Body, and entring it from every part, do presently fill the passages how strait so ever they be, and drive to flight hither and thither the Spirits, and compel them into a close place, who being then beset and reduced to a strait corner, when they can neither resist long, or are able to penetrate into other Pores possessed by the Morbifick matter, at length are struck flat down, letting go every function of the knowing soul; but then they do not easily nor quickly rise up again, because they are not able to quit themselves from the embraces, or bonds of the malignant matter, nor pass any where into empty or open places; wherefore, they lie long suppressed, till at length sometimes perhaps that matter, though leasurely, is dissipated, or supped up into the Blood, or issuing forth from the little Pores of the Marrow, slides forward into the Ventricles of the Brain; or at length, that matter sliding a little lower, and being impacted on the Streaked Bodies, either one or both of them, causes the *Hemiplegia*, or half Palsie, or the Palsie: In the mean time, as the Spirits, within the *Callous* Body grow free, and getting wider spaces, they resume their wonted offices; which they indeed execute, until new matter springing again in the compass of the Brain, and being by degrees increased, descending into the *Callous* Body, brings on another fit; out of which, if the Spirits get not, by either of the aforesaid ways, being wholly discomfited, they perish by degrees.

1. What its Conjunct Cause is.

It consists in the Pores of the callous Body, being suddenly stop'd, and the Spirits biing driven away, by the contact of malignant matter.

If you should ask after the nature or disposition of this Morbific matter; it may be suspected, that the Animal Spirits in the *Apoplexy* are plainly affected after another manner, than in Convulsive passions; to wit, those obnoxious to this blasting obtain a *Copula* contrary to the explosive, that is, *Vitriolick*, rather than *Nitro-sulphureous*; and so by it their spiritous-saline particles are wholly fixed, and are hindred from entring into any motions or explosions, even as when the *Vitriolick* particles being beaten and combined with the fulminating gold, they quite take away its explosive or letting off virtue, and congeal and render immoveable all other active particles, like the blowing of a freezing air. The Animal Spirits seem to be not unlike the same, and their *Copula*'s have divers sorts of adjuncts, some of which induce an *Elastick* and very *explosive* virtue, as in the Convulsive Distempers, and others a stupor, numness, or immobility, as in the sleepy Diseases, and also in the *Apoplexy* and *Palsie*.

What the nature or disposition of the morbifick matter is.

Thus much concerning the Conjunct Cause, and formal reason of the *Apoplexy*; as to its *Procatarctick* or fore-leading Causes, they are much after the same manner as in most other *Cephalick* Distempers; to wit, both the Blood is in fault, for that it affords to the Head extraneous particles, and very contrary, or as it were destructive to the Texture or constitution of the Animal Spirits, either begotten in it self, or taken from some other place; and then the Brain is in fault, for that being weak in its disposition, and so its Pores and passages too dissolute and lax, so that it always and easily admits without impediment, the Morbific matter poured forth from the Blood. There is no need that we should here rehearse or unfold particularly the peculiar reasons of either, and the various ways by which it is done; but we shall rather refer you to what we have already said very largely, concerning the foreleading causes of the inveterate Headach, and also of the *Lethargy*. Further, the like or the same evident causes, which were noted in those Distempers, and in other sleepy Diseases, ought here to be taken notice of, to be shunned carefully by *Apoplectick* people.

The procatarctic Cause of the habitual Apoplexy.

From

The differences of this Diſeaſe. From what hath been ſaid, the differences of this Diſeaſe may be eaſily known: 1. What we mentioned but now; The *Apoplexy* is either accidental, which is ſuddenly, and at once excited, without any foregoing cauſe, and almoſt indifferently in all, from ſome ſtrong evident cauſe; or it is wont to be eſteemed habitual, which depending upon a previous diſpoſition, hath frequent fits, by reaſon of ſeveral occaſions: 2. From the reaſon of the ſubject, this Diſeaſe is ſaid to be proper, either to the Brain or Cerebel, or common to both: previous and frequent *Scotomies* or dizzineſs with miſts before the eyes, and the Diſtemper of the *Vertigo*, denote the Brain more obnoxious to this Diſeaſe: A frequent Night-Mare, intermitting Pulſe, often Swooning and failing of the Spirits, argue the *Cerebel* to be evilly diſpoſed.

3. In reſpect of magnitude, it is either univerſal, every function, both merely natural and the ſpontaneous ceaſing; or it is partial, this or that part being affected by it ſelf, then for that the faculties of either, now all, now many only, yet none excepted ſuffer an *eclipſe*; for in either regiment, the morbific matter deſcending to the middle or marrowie part, poſſeſſes ſometimes all its whole ſubſtance, ſometimes part of it, to wit, the fore part, hinder, or middle part. 4. In reſpect of the antecedent cauſe, the *Apoplectical* diſpoſition is either hereditary or innate; or acquired by means of an evil dyet, or other accidents.

Its Prognoſticks The *prognoſtick* or fore-judging of this Diſeaſe is always denounced deadly or dubious; for the *Apoplexy* is never without preſent or future danger. But it is worſt of all, in which, beſides the abolition of all the ſpontaneous functions, the Pulſe and breathing alſo are either deficient, or are performed laboriouſly; and then for the moſt part it happens, with a foam at the mouth, and ſnorting; upon which comes a ſweat, which is often like melted greace, and indicates a very ſudden death to be at hand.

Thoſe who are blaſted or ſtrucken, and are preſently deprived of Pulſe and breathing, and a little after growing cold, and ſeem dead or without any life, are not preſently to be had from bed, or left deſtitute of Medicinal helps: further, though there be no hopes of life, they ought not to be buried under three or four days; becauſe ſuch do ſometimes revive again, either of their own accord, or by the uſe of Rememedies: which certainly comes to paſs, not becauſe a vital heat is at laſt ſtirred up in the heart (for it is not there extinguiſhed altogether;) but becauſe the Morbific matter being diſcuſſed, or evaporated from the *Cerebel*, the motion of the heart is reſtored, like a Clock when the weights are put on.

In the *Apoplectical* fit, if any help follows upon letting of Blood, there is hope of health. But if after this and other Remedies, the Diſtemper continues without intermiſſion, above the ſpace of a night or a day, or grows worſe, the caſe is deſparate.

If after the firſt ſpeechleſs fit being over, the ſick perſon becomes more nummed and duller, and diſtemper'd with a *Scotomy*, and frequent *Vertigo*, it is a ſign that he will be obnoxious to more fits of this aſtoniſhing Diſeaſe: for the aforeſaid diſtempers proceed from the Morbific matter, already laid up in the compaſs of the Brain, and there flowing ſprinklingly, and thence deſcending thorow the very ſmall Pores only, into the middle part: which matter whether *Vitriolick* or *Narcotick*, growing to a greater fulneſs, calls on this blaſting or being ſuddenly ſmitten.

The Curatory Method. The *Therapeutick* Method, is either Curatory, for the taking away the fit, when it is upon one; or preſervatory to prevent it, that it may not return: the former belongs to every *Apoplexy*, the other only to the habitual.

What is to be done in the Fit. The aſſault or fit of this Diſeaſe being come, (if it proceeds not from ſome outward or vehement hurt of the head) although it is not known, whether it be excited or no from an invincible cauſe, ſuch as the Blood being let forth of the Veſſels, or the breaking of an Impoſthum in the Brain, yet we ought carefully to endeavour the Cure of it. And becauſe the blood being too hot or ſwelling up, is wont ſometimes to bring in the Morbific cauſe, or at leaſt to increaſe it, and the ſame ſinking down, and becoming more ſetled, ſometimes carries it away; therefore in the firſt place, you ought to deliberate, concerning the moderating its courſe. And here a queſtion ariſes, concerning the placing of the Patient, to wit, whether he ought preſently to be put to bed, or to be detained out of it for ſome time: ſome religiouſly obſerve the latter, and that not without reaſon; to wit, becauſe in Bed there is a greater propenſity to ſleep, and the blood growing hot, and flaming forth more plentifully, by reaſon of the heat of the Bed-cloaths, pours forth ſtill more recrementitious matter into the diſtemper'd Brain: on the contrary, whilſt the ſick is thinly cloathed, and placed in a Chair, the blood flows more ſlowly, and the ſinking Veſſels ſeem more apt rather to ſup back the humors out of the Head, than to ſend them thither.

In what poſition the Sick ought to be kept.

Wherefore,

Wherefore, if the Patient be ſtrong enough, it will be expedient perhaps to let him ſtay out of bed for ſix or eight hours, till the flux of the Morbific Matter paſſes over, and the courſe of the Blood be made more quiet by *Phlebotomy*, and other Remedies carefully adminiſtred: but the weak, and who are of a tender conſtitution, let them be put to bed as ſoon as they are ſmitten. But let not the ſick, whether in bed or up, lye upon his back, but with his head ſomewhat upright, and inclining either to one ſide or the other.

Phlebotomy, neceſſary almoſt in all *Apoplectical* perſons, is not to be deferred: but the Blood is copiouſly drawn back by a ſtrong *Clyſter*. In the *Clyſter* may be diſſolved the *Species* of *Hiera Diacolycinthia*, and a troubled Infuſion of *Crocus Metallorum*. Let a large Bliſtering Plaſter be applied to the hinder part of the Head, and other drawing *Cataplaſms* to the Legs and Feet: Let the Temples and Noſtrils be anointed with proper Oyls and Balſoms, and let painful rubbings be uſed almoſt to the whole Body; In the mean time, let things that ſtir up the Animal Spirits, and help them out of their bonds be given them; *viz.* Spirits of Harts-horn, Sut, and the like, with a *Cephalick Julep*. *Phlebotomy.* *Other ways of Adminiſtration noted.*

After this the ſick being placed in the bed (if he be able and doth eaſily Vomit) let an *Emetick* be given him, of the Salt of *Vitriol*, *Oxymel* of *Squills*, or an Infuſion of *Crocus Metallorum*, and then with a Feather put down the throat, provoke vomiting four or five times, drinking between whiles Poſſet-drink. *Vomiting Medicines.*

Vomiting being over, let there be given Comforters, as the *Elixir Vitæ* of *Querſitan*, Spirits of *Lavender*, or *Camphorated Treacle*, *Tincture* of *Pæony*, or of *Amber*, or of *Coral*, with *Apoplectical* Water, or other appropriate Waters in a convenient Doſe, and repeated as the buſineſs requires. *Comforters.*

On the ſecond day, the ſame Remedies being ſtill continued, let dry Cupping-Glaſſes, or with Scarification, be applied between the ſhoulders, or to the hinder part of the Neck; or if more blood ought to be taken away, let the jugular Vein be opened; the *Clyſter* repeated; apply to the Noſe Spirit of *Sal Armoniack*, or a fume of *Galbanum* boiled in ſtrong Vinegar. Beſides, let *Errhines* or Sneezing Powders, and things to chew in the mouth to draw away Rheum be uſed. Then in the Evening let a Purge be ordered of *Pil. Rudii*, or a Solutive Electuary of Roſes, diſſolved in ſome liquor. *Cupping-glaſſes.*

None of theſe things helping, though there be ſmall or no hope, the top of the Head being ſhaven, let glowing Iron be held over it, or a large Bliſter made upon it; and let the other part, eſpecially the Forehead, and forepart of the Head, be bathed with *Bezoardick* Vinegar; let Leeches be ſet to the Temples, or behind the Ears; let alſo a large Doſe of Spirits of Harts-horn, or of Sut, be often poured down the throat; theſe and other the like adminiſtrations, are to be uſed till you ſee death at hand; which (as *Celſus* ſaith) theſe ſort of Remedies only defer, but ſome times haſten life. *Hot or glowing Iron.*

The *Prophylactick* or preventive Method, reſpects both thoſe who have been troubled with one or more fits, and alſo thoſe who are ſeen to be prone to it, as thoſe who are born of *Apoplectick* Parents, or are frequently obnoxious to the *Vertigo*, the *Incubus*, or Swooning away; alſo ſuch who have ſhort and brawny Necks. *The preſervatory Method.*

Let Purging and Bleeding be ordered Spring and Fall, where it is convenient; as to the former, thoſe who are eaſie to vomit, let them firſt take an *Emetick*, of the infuſion of *Crocus Metallorum*, with the Salt of *Vitriol*, or of the *Sulphur* of *Antimony*; and then after three or four days, let there be given a Doſe of *Pil. Rudii*, or of *Amber*; and after a due diſtance between, let it be repeated three or four times: Let two large Iſſues be made between the ſhoulders; or if that place doth not pleaſe ſome, let them be made, in one of the Arms, and in the oppoſite Leg. *Purging and Bleeding Spring and Fall.*

On other days, free from purging, let altering and *Cephalick* Medicines be taken twice a day. *Cephalick Remedies.*

Take *of the Conſerves of the Flowers of the Lilies of the valley (or of the male Pæony) ſix ounces, of the Powder of the Root of the male Pæony half an ounce, of humane Skull prepared three drams, of the Seeds and the Flowers of the male Pæony powdered, each two drams; of red Coral prepared, of Pearls, and of the whiteſt Amber, each one dram; of the Salt of Coral four ſcruples, of the Syrup of the Flowers of the male Pæony, what will ſuffice to make an Electuary: The Doſe two drams morning and evening, drinking after it two or three ounces of the following Water.* *An Electuary.*

Take *of the Roots of the male Pæony, of Imperatorian Angelica, each half a pound; of the Root of Zedoary, of the leſſer Galangal, each one ounce; of the leaves of the Orchard Miſſeto, of Rue, Sage, and Betony, each four handfuls; of the outer rind* *A diſtilled Water.*

of

of ten Orenges, and eight Lemons, of Cardomums, Cloves, Nutmegs, each half an ounce; all being cut and bruiſed, pour to them of white Wine (in which two pints of the dung of the Peacok hath been infuſed for a day) ten pints: let them infuſe, cloſe ſhut for three days; then diſtil it according to art, and let the whole liquor be mixed together.

Lozenges. Take *of the Species of Diambræ two drams, of the Powder of the Root of the male Pœony, of Zedoary picked, each one dram and a half; of Pearl one dram, of the Oyl of the pureſt Amber half a dram, of the whiteſt Sugar half a dram, being diſſolved in ſix ounces of the water of Pœony, and boiled up to a conſiſtence: make Lozenges according to art, each weighing half a dram: Let the Patient eat one or two often in a day, at his pleaſure.*

Spirits and Tinctures. Within the fifteenth or twentieth day, that the Remedies may not be irkſome, and may profit the better, let them be changed: therefore, inſtead of the *Electuary* let there be ſubſtituted for two or three weeks, ſometimes the Spirit of *Sal Armoniack*, with Amber or Coral, or elſe impregnated with humane Skull or *Caſtor*; ſometimes *Elixir* of *Pœony*, or *Tincture* of *Amber* or *Coral*, or *Elixir Vitæ* of *Quercitan*, or the ſimple mixture: alſo inſtead of it, may be drunk compounded Waters, or Water of black Cherries, or Walnuts; or the ſimple Waters of Roſemary, or Lavender; ſometimes a draught of Poſſet-drink, with Flowers of the *male Pœony* or the *Lilies* of the valley boiled in it; or a draught of *Tea* or *Coffee* in the morning, (let the water of which it is prepared have ſuch ingredients firſt boiled in it) or let *Chocalate* be prepared after this ſame manner.

Tea, Coffee, and Chocalate prepared, how to be made and taken.

Take *of the Powder of the Root of the male Pœony, of humane Skull prepared, each half an ounce; of the Species of Diambræ two drams, make a Powder; to every paper add of the Kirnels of the Cocoe Nuts one pound, of Sugar what will ſuffice; of this make Chocalate: take of it half an ounce or ſix drams every Morning in a draught of the Decoction of Sage, or of the Flowers of Pœony, or ſuch like.*

A Powder. Take *of the Powder of the Root of the male Pœony, of humane Skull prepared, each one ounce and a half; of the pick'd Root of Zedoary, Cretick Dittany, Angelica, Contrayerva, each two drams; make a fine Powder of them all, add to it of the yellow of Orenges and Lemons Candied, each two ounces; let all be beaten to a Powder: take about half a dram, or a dram an hour before and after meals.*

For ordinary drink, *let a Veſſel of four gallons be filled with ordinary Ale, in which ſix handfuls of white Horehound dryed had been boiled, of Anacardine and Cardomums cut and beaten, each one ounce and a half; of it make a bag to hang in it.*

Medical Air. Firſt of all, a very ſtrict dyet ought to be ordered; let a temperate, dry and open air be choſen; let good and wholeſome meats be eaten, and ſlender meals. Let ſuppers be ſparingly taken, or none at all: Let noon-ſleeps, drinking bouts, and other cuſtomary things about the non-naturals be ſhunned.

Examples. I could here propoſe many Hiſtories of *Apoplectical* perſons, to wit, of ſome who were once or twice touch'd, and yet living; and of others who have dyed at the firſt aſſault, or in the ſecond or third fit. The moſt Reverend Father in God the Lord *Gilbert* Archbiſhop of *Canterbury*, recovered of a grievous *Apoplectical* Fit, ſix years ago, (God proſpering our medicinal help, to whom we render eternal thanks) and from that time, though he ſometimes ſuffer'd ſome light skirmiſhes of the Diſeaſe, yet he never fell, or became ſpeechleſs or ſenſeleſs. But we ſhall not ſtay upon this or other examples to unfold them largely, becauſe there is nothing in them very rare, that may illuſtrate the *Ætiology* of this Diſeaſe. Some of their dead Carcaſes I have diſſected, but only of ſuch as the cauſe of death was from ſome former great hurt of the head, as ſome blow, or by means of ſome blaſt; in all which the extravaſated Blood, or an Impoſthum was the cauſe of their death: We have been prohibited often by their Friends, from opening thoſe dying of an habitual *Apoplexy*, who expecting to have them revive again, held it as a deadly thing, and ſo wholly forbid *Anatomy*: But I ſhall here relate a notable *Anatomical* obſervation taken about five years ſince at *Oxford*.

A very rare Hiſtory. An ancient Divine, an honeſt and a godly Man, indued with a fat body, a ſhort and brawny Neck, being long unhealthy, and living a ſedentary life, contracted a very *Scorbutick* evil diſpoſition: being troubled with a difficult and laborious breathing, with an heavineſs of the Head, and unwonted numneſs, was ſcarce able to endure any thing of labour or exerciſe, more than that he daily went and came from his Chamber to the Chapel and Hall: one Morning he came to the Chapel a little before Prayers begun, and while he was on his knees, he was ſuddenly ſtruck, and immediately

ately became ſpeechleſs and ſenſeleſs, and fell on the ground; but being carried thence, and his cloaths taken off, he was put into a warm Bed. I and other Phyſicians being preſently ſent for, and coming as ſoon as we could poſſibly, we found him not only without Pulſe, ſenſe, and breathing, but all his Body cold and quite ſtiff; nor could he be recalled to life or heat, by any Remedies or ways of adminiſtrations, though uſed for ſome time: by which we ſuſpected, that the Pulſe of his heart was wholly hindred at the firſt ſtroke, and that its flame being put out, preſently all motion of the Blood was ſuppreſſed.

An Anatomical Obſervation.

The next day, ſeeing the Carcaſe dead enough, and ſtiff, we opened it, nothing doubting but that the Diſtemper ſo ſuddenly mortal, would ſhew clear marks of it within the Head. But there, or in any other part, was not the leaſt ſhadow of this moſt cruel Diſeaſe: The Veſſels watering the *Meninges* were moderately filled with Blood, without any Inflammation or Extravaſation: The Brain, the Cerebel, and the oblong Marrow, with all their proceſſes and prominences, appeared every where thoroughout firm, and well coloured, both without and within: nor was there any Serum or Blood poured forth any where, within the Pores or paſſages, nor yet within the greater Ventricles, nor heaped up; yea the *Choroeidal* Infoldings placed both within the cavity of the Brain, and behind the Cerebel, ſeem'd free from all fault; ſo that the Morbific matter, equally thin and ſubtil like the Animal Spirits, whom it affected, remained wholly inviſible, and we could only argue its preſence by the effect.

But leſt this ſhould lye hid ſome where without the Head, after the contents of the head were diligently inſpected, we came to the Breaſt: where the diſcoloured Lungs being through the whole ſtuffed with a frothy matter, manifeſtly ſhewed the cauſe of the ſhort and difficult breathing. But the Heart was ſound and firm enough, free from any obſtruction or fleſhy Concretions. Further, neither in the neighbouring parts, or in others about the Viſcera, was found any Impoſthum or Ulcer, by whoſe contact or ſtink, the Heart could be ſuddenly oppreſſed, or the Vital Spirits (if this be poſſible) might be choaked.

Wherefore in this caſe, nothing could be ſuſpected elſe, but that the Animal Spirits implanted within the middle of the Cerebel, were put to flight, and as it were extinguiſhed ſuddenly, by ſome malignant, or *narcotick*, or otherways deadly Particles, ſo that the motion of the Heart preſently failing, like the firſt moving wheel in a Clock or Watch, immediately all the other functions, their impulſes being taken away, wholly ceaſed.

CHAP. IX.

Of the Palſie.

The middle of the Brain, which is the Seat of the Apoplexy is alſo the Seat of the Epilepſy.

THE middle of the Brain, or the *Callous* Body, to which we have aſſigned the ſeat of the *Vertigo* and *Apoplexy*, ſeems alſo to be the primary diſtemper'd place in the *Epilepſie*: Concerning which, as alſo concerning Convulſie Diſeaſes, ſince we have elſewhere largely treated, we ſhall therefore here paſs over purpoſely in this part of the Diſeaſes belonging to the Head, and according to out wonted method, deſcend yet lower, to the other regions of the Brain, and its dependences; and now we ſhall endeavour next to deſcribe the Diſtempers which belong to the Streaked Bodies, Oblong Marrow, and alſo to the Nerves, and nervous Fibres.

The ſtreaked Bodies, the Medullar Trunks, and the Nerves, are the Seat of the Palſy.

We have formerly ſhewed, that theſe parts do perform all the functions belonging to motion and ſenſe; wherefore, the failing or the enormities of theſe, are the affections of thoſe Bodies, or of the Spirits inhabiting them. But indeed ſenſe and motion are hurt chiefly after two manner of ways: to wit, either is wont to be perverted or hindred; when Motion is perverted, Cramps and Convulſions; when Senſe, pain ariſes; when either function or both together is hindred or aboliſhed, the Diſtemper is thence ſtirred up called the *Palſie*; which we are at preſent about to handle. Concerning Convulſion and Pain we have already treated.

what the Palſie is.

The *Palſie* is deſcribed after this manner, to wit, *That it is a reſolution, looſening, or relaxation of the nervous parts, from their due tenſity or ſtiffneſs; by which means Mo-*

tion and Senſe, to wit, either one only, or both together, in the whole Body, or in ſome parts, cannot be exerciſed after their due manner.

Its Conjunct Cauſes are, Obſtruction of the paſſages, and the Impotency of the Spirits.

The nervous parts are looſened, becauſe the Animal Spirits do not ſufficiently irradiate them, nor blow them up, nor actuate them with vigor. The cauſe of which defect is, either an obſtruction of the ways, by which their trajection or paſſage is hindred; or the impotency of the Animal Spirits, for that they are diſtemper'd with a numneſs, or that being but few in number they do not lively enough unfold themſelves. By reaſon of theſe various means of being affected, there ariſe diverſe kinds of *Palſies*. For in the firſt place, as to motion by it ſelf, this ſpontaneous faculty (which is chiefly and almoſt only lyable to the *Palſie*) is ſometimes taken away in the whole, or altogether in ſome parts; but ſometimes this, being only hindred, is leſſened or depraved. Secondly, In like manner alſo one ſenſe only by it ſelf, or more together, is ſometimes wholly taken away, and ſometimes only much diminiſhed or vitiated. Thirdly, Sometimes it happens that both powers are hurt at once. We ſhall ſpeak of each of theſe in their order; and firſt of the *Palſie*, in which ſpontaneous motion is aboliſhed; which we ſay is excited from two cauſes chiefly; to wit, the ways being obſtructed, and the Animal Spirits being touched with a numneſs, or as it were with a certain malignant blaſt.

In the Palſie either motion, or ſenſe only, or both together, is hurt.

Spontaneous motion is aboliſhed by reaſon of the ways being obſtructed, either in their beginnings, or the middle paſſages, or about the ends.

As to the former, an interception of the Spirits from the looſned parts, by reaſon of their paſſages being obſtructed, that always exiſting above them, is wont to be cauſed in various places, and for divers cauſes; but chiefly it happens in the firſt *ſenſory*, *viz.* in the Streaked Bodies, or ſome where about the Medullar Trunks, or laſtly in the Nerves themſelves; and ſo, either in their beginnings, or middle proceſſes, or in their extreme ends, (*i. e.*) the nervous Fibres. When the evil or hurt is brought to the Streaked Bodies, or the oblong, or ſpinal Marrow, it either obſtructs the whole Medullar thread or rope, from whence ariſes an univerſal Palſie below the diſtemper'd part; or one moiety of it, whence comes the *Hemiplegia* or Palſie of one ſide; or it affects in one ſide, or in both at once, the little heads of ſome Nerves, whence looſnings or reſolutions are cauſed in this or that member apart from the others.

The ways are obſtructed by Impletion, or Compreſſion, or by a breaking of the Unity.

There are many means whereby the ways or paſſages of the Animal Spirits are obſtructed in the aforeſaid bodies. Firſt, Either their paſſages are filled by an extraneous matter impacted in them: Or, Secondly, They are preſſed together by Blood flowing out of the Veſſels, a Serous deluge, or ſome Tumor lying upon them: Or, Thirdly and laſtly, the unity or continuity is broken, as by a ſtroke, or wound, or bruiſe, alſo by exceſs of cold or heat. According as theſe ſeveral places are diſtemper'd, and the ſeveral means of their being affected, we ſhall run thorow the chief caſes of the *Palſie*, together with the *Ætiology*, or reaſon thereof, with the manifold appearances of *Symptoms* in them; and in the firſt place we will ſpeak of the *Palſie* ariſing from an hurt brought to the common *Senſory*, to wit, the Streaked Bodies.

An obſtruction in the ſtreaked Bodies cauſes the Univerſal Palſie, or the Palſie of one ſide.

And indeed, that it ſo comes to paſs, I have proved by ocular inſpection, and ſhall be plainly demonſtrated anon by *Anatomical* obſervation. Further, as often as an univerſal or an half *Palſie* follows, (as it is often wont to do) upon a *Lethargy* the *Carus*, or *Apoplexy*, any one may conceive, that ſuch a change of the Diſeaſe, happens from a tranſlation of the Morbific matter; for that this at length going out of the Pores and paſſages of the *Callous* Body, which it at firſt poſſeſt, and ſinking down a little lower, runs into the Medullary tracts of one of the Streaked Bodies or perhaps both of them. And ſo, when the Animal Spirits are hindred from their wonted out-flowing, or irradiation into the nervous Stock, the motive faculty only, or (if the obſtruction be very great) both this, together with the ſenſitive, is hindred.

I have ſometimes obſerved in a *Palſie*, coming after a grievous fit of ſome other Diſeaſe, that all the moving parts, of either ſide, have been looſened after a more light manner: For though they were not able to perform the more ſtrong motive endeavours, yet for the moſt part they could extend, bend, yea and move their members hither and thither, to wit, becauſe the Morbific matter being diffuſed abroad, thorow both the Streaked Bodies, had not ſo cloſely filled every where all the paſſages: Moreover, on the contrary, I have known in a *Palſie* of one ſide, ſo ſuddenly excited, that there has been a far greater reſolution, ſo that they ſo ſtruck, were not able to move any way hand or foot, nor any other member on the diſtemper'd ſide. Further, ſometimes it happens, from the Morbific matter being copiouſly fallen down, and obſtructing cloſely all the Medullary tracts of one of the Streaked Bodies, that all the reſpective parts, have not only been deſtitute of motion, but ſome of them

them alſo of ſenſe; ſo that ſome members felt not any painful impreſſion, how vehement ſo ever it was. Such a Diſtemper happening in a leſſer degree, is wont to excite a ſenſe of numneſs, or pricking or tingling, ſuch as in members lean'd or lain upon.

Why ſenſe is not hindred as well as motion in every Palſie.

If it be demanded, why ſenſe is not always hindred as well as motion in every *Palſie*, ſince as it ſeems either is performed by the ſame Nerves and Fibres, within the ſame Medullary tracts, ſo that one faculty is only the inverſion of the other? as to this we may ſay, that as light beams thorow glaſs, when wind is excluded, ſo alſo ſenſe being ſafe, oftentimes motion is loſt. Beſides, ſenſe is only a paſſion, and a ſenſible impreſſion, which is propagated from the organ, by a continuity of the nervous proceſs, to the common ſenſory, without any endeavour or labour of the Spirits; which may be done, though the common ſenſory be in ſome meaſure obſtructed, and the Spirits inhabiting it benummed: But motion is a difficult and laborious action, to which is required, that the Spirits expand or ſtretch out themſelves lively, and not only put forth as it were exploſive endeavours in the moving organs, but chiefly about the parts, where the beginning of the motion and its firſt force is, and from thence, in the whole paſſage thorow the nervous parts. Wherefore, as but a few Spirits and bound, ſuffice for ſenſe; many, free, and expeditious as to their expanſions, are required for motion.

In an univerſal Palſie why all the Muſcles of the Eyes and Face are not looſned.

But that the Morbific matter being ſlid down into the Streaked Body, the Muſcles of the Eyes, Mouth, and Face, do ſtill retain their motions; it is becauſe that ſome of them, about the beginning of the Spinal Marrow, below all the Nerves, ariſing from the oblong Marrow, have their place of obſtruction; I ſay, that it is ſo, becauſe the Nerves deſtinated to the aforeſaid Muſcles, (the motions of which are ſtirred up by natural inſtincts) and brought from the fifth and ſixth pair, even as the Nerves ſerving the Præcordia and Viſcera, derive chiefly the influences of the Animal Spirits from the Cerebel; whoſe regiment, though the Streaked Body be diſtemper'd, remains often unhurt.

A Compreſſion of the ſtreaked Body ſometimes ſtirs up the Palſie.

Not only an obſtruction of the Streaked Body, but alſo a compreſſion ſometimes cauſes the *Palſie*, as ſhall be ſhewed by and by from *Anatomical* obſervation; to wit, when the blood is extravaſated, and growing cloddery within the inferior cavity of the Brain (and perhaps a Serous deluge is there heaped up) and doth lie heavily upon the Streaked Body, and preſs it together, ſo that for that reaſon, the Medullary tracts being bound together, are hindred from the Spirits flowing into them.

A Paralytick obſtruction doth ſometimes happen in the Oblong and Spinal Marrow.

Next after the Streaked Bodies, the ſeat of the Morbific Cauſe is in the oblong and ſpinal Marrow; alſo ſometimes in theſe, though rarely an obſtruction, but more often a compreſſion, or a ſolution of the unity, excite the *Palſie*.

As to the former, it is not probable, that great plenty of Morbific matter ſhould be ſent from the Brain, into this or that part together and in heaps; for ſuch a great and ſudden flux hardly happens beyond the ſtreaked Bodies. But it may be ſuſpected, that *Narcotick* or otherways deadly Particles, being forthwith poured forth into the Brain, and from thence thruſt forth into its appendix, doth at firſt ſtick within the more narrow ſpaces of the Medullary Trunk, and then by degrees being heaped up, cauſes the *Paralytick* obſtruction, whilſt theſe Particles are carried in the Brain here and there, in the *Callous* or Streaked Bodies they ſtir up frequent *Vertigoes*, and miſts before the eyes, and ſometimes in the motive parts ſhort numneſſes; but theſe being by degrees heaped up together within the Trunk of the oblong Marrow, or the ſpinal, foraſmuch as they poſſeſs all or part of its paſſage, and by that means either obſtruct all the Pores of the Spirits at once, or ſome ranks or orders of them, they bring forth either an half Palſie, or a looſening of ſome members, ſometimes the ſuperior, ſometimes the inferior.

A Palſie often ſucceeds ſtupidity, or becoming fooliſh.

I have obſerved in many, that when, the Brain being firſt indiſpoſed, they have been diſtemper'd with a dullneſs of mind, and forgetfulneſs, and afterwards with a ſtupidity and fooliſhneſs, after that, have fallen into a Palſie, which I often did predict; to wit, the Morbific matter being by degrees fallen down, and at length being heaped up ſome where within the Medullar Trunk, (where the Marrowy Tracts are more ſtraitned than in the Streaked Body) to a ſtopping fulneſs. For according as the places obſtructed are more or leſs large, ſo either an univerſal *Palſie*, or an half *Palſie* of one ſide, or elſe ſome partial reſolutions of members happen.

A Palſie ſometimes from the preſſing together of the Marrowy Cord.

But in either Marrow, and eſpecially the Spinal, an interception or inhibition of the Spirits, creating a *Palſie*, moſt often happens from a compreſſion, or a breaking of the unity: The extravaſated Blood, or the Corruption flowing from the broken Impoſthum, and perhaps a Serous deluge being depoſited within the hollowneſs of the Back-bone; yea alſo an hard Tumor, being riſen ſomewhere in it, by preſſing

together the marrowy rope, ſhuts up the ways of the Spirits. Further, either a ſtroke, wound, or bruiſe of the Head, or *ſpine*; yea and a diſtortion of this latter, do often pervert or break off the Marrowy Tracts; yea an exceſs of cold taken in Froſt and Snow, ſtraitens and ſtops up the paſſages of the Spirits. Thoſe kind of caſes, and inſtances, being obvious enough to common obſervation, there will not be any need here to ſpeak of them particularly, or to unfold them more largely.

Sometimes from the unity being broke.

Thirdly, The Morbific cauſe being ſometimes planted lower, poſſeſſes either the greater Trunks, or the leſſer ſhoots of the Nerves themſelves; and that likewiſe is either an obſtruction or a compreſſion, or a breaking of the unity, by reaſon of any of theſe ways, and according to the like means of affecting, within the nervous paſſages, as in the marrowy, it is wont to be excited.

The Seat of the Palſie ſometimes in the Nerves themſelves, which are either obſtructed, or compreſſed, or the unity broken.

1. An Obſtruction.

The oppilative or ſtopping Particles being fallen down, from the Brain, and carried forward into the oblong Marrow, enter into the Nerves, deſtinated to the Muſcles of ſome parts of the Face, and by obſtructing the ways of the Spirits in them, bring forth the *Palſie* in the Tongue, and ſometimes a looſening in theſe or thoſe Muſcles of the Eyes, Eye-lids, Lips, and of other parts; and then by reaſon of the contrary Muſcles being contracted beyond meaſure, they ſtir up a Cramp or Convulſion in the oppoſite part.

Sometimes in the beginning of the Nerves.

Nor is it leſs uſual, for the ſame Particles, for that they are fewer, to be carried yet further, without any great hurt into the Spinal Marrow; and laſtly going forth from it, to run ſometimes into the ſeveral Trunks of the Nerves, and ſometimes into ſome handfuls of them; and for that reaſon, to induce the Palſie to the ſeveral Muſcles or members, or in ſome of them only. As often as for this cauſe, the Muſcles of one ſide of the Neck are reſolved, or looſened, the other oppoſite being too much contracted, render the Neck twiſted or awry. It ordinarily happens, by reaſon of ſome private Nerves being ſo obſtructed, for ſome Fingers of the Hand, or Toes of the Feet to be looſened. But if many handfuls of Nerves together happen to be ſtopped, a *Palſie* follows, oftentimes in the whole Arm or Thigh. It would be too tedious to mention every caſe here, by which the Nerves are wont to be ſtopped, about their beginnings, middle proceſſes, or utmoſt ends, to wit, the Membranaceous or Muſculous Fibres, by reaſon of compreſſion, or breaking of the continuity, and ſo deny the exerciſe of the moving faculty to the reſpective parts: The reaſons of theſe kind of Diſtempers are ſo clear and manifeſt, and ſo commonly known, that it would be ſuperfluous to inſiſt on the opening them any longer. But we ſhall rather paſs to the other conjunct cauſe of the *Palſie*, which more immediately affecting the Animal Spirits, and ſometimes ſtriking down, and as it were extinguiſhing them, by mere contact, or as it were by a malignant blaſt, brings in a reſolution or looſening in the reſpective parts.

2. Sometimes in the middle.

3. Or in their utmoſt proceſſes.

The other conjunct cauſe of the Palſie, to wit, the impotency of the Spirits;

Often ariſes from narcotick or vitriolick Particles, by which the Spirits are put to flight.

What we before affirmed in the *Apoplexy*, we now again do the ſame in the *Palſie*, that there are deadly Particles, not only oppilative or ſtopping, but ſometimes *Narcotick* or *Stupefactive*, and as it were extinguiſhers of the Spirits; which kind of affection, if it be ſtrong, cauſes ſometime *Paralytick* Symptoms, without any great obſtruction of the ways. The breath or ſteams of *Antimony*, *Mercury*, or *Auripigment*, often cauſes weakneſſes, tremblings, and looſening of the Members, in ſuch as are long converſant among the Furnaces of *Chymiſts*, and of Metals. We may in like manner believe, that in ſome *Scorbutick* and very *Cacochymical* people, heterogeneous Particles, and as it ſeems of a *Vitriolick* nature (paſſing thorow the Brain, and its marrowy appendix) do enter into the nervous paſſages, together with their watering Juice, and caſt down ſome handfuls of the Spirits in them, or ſuppreſs their motion. Hence ſuddenly ariſe ſtupors, numneſs, or looſeneſs in the Members, or Muſcles, ſometimes in theſe, ſometimes in thoſe, and ſoon after vaniſhing in one place, preſently ſpring up again in another: But at length, when theſe ſort of Particles being abundantly poured forth into the Nerves, and laid up in heaps, they become variouſly fixed here and there; and moreover, ſhut up the ways of the Spirits, and ſo cauſe a fixed and permanant *Palſie*. And indeed, in every *Palſie*, made by obſtruction, the Morbific matter is not thick and cold Phlegm, (as *Galen* and many other Phyſicians have aſſerted) for ſuch doth not paſs thorow the Brain, much leſs the nervous paſſages; but it ſeems to conſiſt of moſt ſubtil and very active Particles, though infeſtous or deadly to the animal regiment: But indeed the *Palſie* happens in Men, no otherwiſe than the blaſting, or burning, or withering in Trees; becauſe ſome winds being indued with very frigid or cold blaſts, to wit, with a Nitrous or a *Vitriolick* Spirit, when they blow upon the green and tender ſprigs of trees, cauſe them ſuddenly to wither, for that the tender ſtalks like Nerves every where inter-woven with the ſprigs and leaves, are bound together by the blaſt of the malignant air ſo fully, that

In every Palſie the matter is not ſo thick or cold, as it is vitriolick or other ways inſeſtous to the Spirits.

The blaſting or withering in Trees like the Palſie.

that they receive not any more the Juice ſent from the Trunk or Root, by reaſon of which defect they wither. Much after the ſame manner, extraneous Particles, and as it were *Vitriolick*, being admitted within the organs of ſenſe and motion, for that they at once bind up the Pores, or caſt down or ſuppreſs from motion the Animal Spirits, cauſe in the reſpective parts, as it were a withering or drying up. But this is not ſo cauſed by mere Phlegm, or a Serous flood, as plainly appears, becauſe thoſe indued with a moiſt and cold Brain, have always their Noſe and Eyes moiſt, with the diſtillation of a ſnotty or watry humor; yea thoſe who are troubled with a Dropſical Brain, in which the Brain, and the tops of either Marrow do as it were ſwim in water, are not for that reaſon diſpoſed to the *Palſie*, unleſs by the preſſing together of the Marrow.

The more remote foregoing cauſes of the Palſy, which are two:

We have hitherto deſcribed the various caſes of the *Palſie*, and the means by which it is cauſed, together with their ſeveral formal reaſons, and conjunct cauſes. As to what belongs to the other cauſes of this Diſeaſe we muſt firſt diſtinguiſh, that it is either accidental or habitual: The former happens to ſome, from a ſolitary evident cauſe, ſuch as a ſtroke, wound, bruiſe, and exceſs of either heat or cold, without any previous diſpoſition; and beſides this, and the conjunct cauſe, which for the moſt part is a compreſſion, or breach of the unity, it hath none: The habitual Palſie depends upon a *Procatartick* cauſe, which is always an extraneous, and as it were a *Vitriolick* matter begotten ſomewhere before, and heaped up, which being from thence ſuffuſed into the organs of ſenſe and motion, for that it ſtops up the marrowy or nervous Tracts or ſometimes profligates the Spirits by mere contact, or effects both together, brings forth looſenings in the reſpective parts, by reaſon of the influence of the Spirits being deny'd them.

1. More remote, to wit, a vicious Blood, and for that reaſon pouring forth a deadly matter upon the head.

This kind of *Procatarxis* or foregoing Cauſe, depends upon a twofold antecedent or ſecret leading cauſe, to wit, one remote, which is a vicious Blood, carrying to the Head a Morbific matter, either begotten in it ſelf, or taken from the Bowels, or ſome other place; and the other more near, which is an indiſpoſed Brain, to wit, weak, and too lax or looſe, or otherways evilly made, and ſo eaſily admitting heterogeneous, or ſtrange and deadly Particles.

2. Nearer, to wit, a weak and looſe Brain, admiting the evil Particles.

The Morbific matter being brought to the Brain, ſometimes induces the *Palſie* primarily, but more often ſecondarily, and not but after other Diſeaſes firſt excited.

The Palſy is either a primary Diſtemper, and a Diſeaſe of it ſelf;

The reaſon of the former, (to wit, that the habitual *Palſie* be a primary Diſeaſe, and by it ſelf) requires theſe two things, *viz.* That the heterogeneous Particles be diſpoſed chiefly for the cauſing or ſtirring up the *Palſie*; then that they be admitted by degrees, and but in ſmall quantity, for if they enter in great heaps, they would firſt cauſe the *Carus* or *Apoplexy*: and if they be not of a plain *Vitriolick* nature or quality, when having paſſed thorow the Brain, they come to enter into the organs of Senſe and Motion, they would firſt occaſion in them Convulſive and painful Diſtempers, yea ſometimes the *Colick*, *Gout*, or *Scurvy* firſt, and then at length, the *Palſie*.

Or ſecondarily, viz. Coming upon or ſucceeding other Diſeaſes.

2. The ſecondary *Palſie* often ſucceeds Diſtempers for the moſt part *Chronical*, after the natural and vital faculties being by them very much hurt: a ſlow and long *Feavour*, ſtrength being at length worn out, cauſes oftentimes enervations or reſolutions of the whole Body, or of ſome Members. Long and immoderate ſadneſs, a Conſumption, a *Scorbutick Atrophy* or waſting, being long fixed in Bed, unhealthy old Age; yea and many other paſſions, after a notable evil firſt brought to the Brain, and nervous Stock, at length brings on the *Palſie*. But indeed this Diſeaſe more frequently comes upon ſome other Diſtempers, either of the Brain, as chiefly the *Carus* and *Apoplexy*, or of the nervous ſtock, and ſuch chiefly are the *Scurvy*, *Convulſions*, *Colick*, and *Gout*. By what means it ſucceeds *Cephalick* Diſeaſes, we have already ſhewed in this; and how the Scurvy, in another tract: we ſhall now inquire how it is often the off-ſpring of the other three.

Wherefore the Palſie often ſucceeds Convulſive Diſeaſes.

1. We have ſhewn already, that the *Spaſme* or *Cramp* or Convulſion, doth ſometimes bring in the *Palſie*, to wit, when from contrary or oppoſite Muſcles, being one of them looſened and the other pulled together: Further, it is an uſual thing, for thoſe who are long obnoxious to Convulſive Diſtempers, to ſuffer at length debilities in ſome members, and at length reſolutions or want of motion. I have known many *Epileptical* perſons, and others troubled with Convulſions, by reaſon of the motive function being aboliſhed or inhibited, in this or that part, to become at firſt lame, and then Bed-rid; the reaſon of which ſeems to be, becauſe the Morbific matter, being continually admitted within the tracts of the Brain and its appendix, both medullar and nervous, and often thruſt forth, doth at length ſo debilitate and dilate

dilate them, ſo that it gives an open paſſage beſides to other kind of Particles, either *Narcotick* or *Vitriolick*; by reaſon of which, the *Palſie* comes after the Convulſion. Further, I have often obſerved, by reaſon of the diverſe mingling of the Morbific matter, (like as when Rain and Snow happen together) that the ſick have at once been infeſted both with Convulſive motions, and the *Palſie*. A notable example of this, with the reaſon of it, we have fully deſcribed in our Tract of Convulſive Diſeaſes, *Chap. IX. p.* 115.

Wherefore the Diſtemper of the Colick.

2. They who are frequently and grievouſly obnoxious to the *Colick*, at length become alſo *Paralytick*. The caſe is ſo frequent here, that the ſucceſſion of this Diſeaſe is accounted among its *prognoſticks*; for thoſe who are wont to ſuffer cruel fits of torments in the Belly, returning by intervals, or are troubled with pains about the Viſcera of the *Abdomen*, cruel and almoſt continual, at length have wandring pains in their Body and Members, and then afterwards ſtupors or numneſs, and laſtly reſolutions or want of motion. The cauſe of theſe effects proceeds, both from the ſeat of the Diſeaſe, and the Morbific matter being changed, to wit, this, which being very ſmall but ſharp and irritative, runs only into the *Sphlanchnick* Nerves, and ſo by reaſon of the Fibres of the *Viſcera* being pulled, did ſtir up in them Cramps and pains; afterwards becoming more copious, and alſo duller and *Narcotick*, pours down thorow the *Spinal* Marrow, and entering into the Nerves deſtinated to theſe or thoſe Members or Muſcles, brings forth reſolutions in the reſpective parts. We ſhall more largely ſhew the reaſon of this, when we treat of the *Colick*.

3. Wherefore the Gout.

It is a very ordinary obſervation, that the *Palſie* comes upon the *Gout* frequently, in the Members obnoxious to it; the reaſon of it is eaſily known, foraſmuch as in this ſickneſs the Morbific matter is twofold, and doth depoſe ſalt and as it were lixivial Particles thorow the Arteries, and as we ſuppoſe others ſouriſh or acetoſous to come to them by the Nerves; (as ſhall be more largely ſhown hereafter) it is no wonder, if that at length, other ſorts of Particles become companions to them, by other beaten ways, and at length either by filling or by compreſſing, obſtruct the very ſmall paſſages of the Spirits.

The evident Cauſes of the habitual Palſie.

As to what belongs to the evident cauſes of the *Palſie*, to wit, for what fore-cauſes or occaſions thoſe diſpoſed to this Diſeaſe contract it the ſooner, or that having been taken with it already, are yet wont to be more grievouſly tormented; I ſay, whatſoever doth more vitiate the Blood, alſo thoſe things that ſtop up the Brain and its nervous appendix, or ſtir up ſuffuſions of the Morbific matter in it, alſo what do inflict a *Narcoſis* or ſtupefaction to the Spirits, or leſſen their numbers, may be brought hither. In this rank firſt occur the diſorders in the ſix non-naturals, an evil manner of living, drinking thin clear Wine, or ſtrong hot liquors, too much ſleep, or too untimely, an idle and ſedentary life, immoderate *Venus*, too much loſs of blood, a moiſt Air or Marſhie dwelling, an Houſe new Plaſtered, Metalick fumes and vapors, frequent uſe of Narcoticks, or ſtupefying Medicines, or too much taking Tobacco, exceſs of cold, heat, or moiſture, vehement and long paſſions of ſadneſs or fear, with many others, all which we have not here leaſure to recite.

Want or paucity of Spirits oftentimes the Cauſe of the Spurious or Baſtard Palſy.

Thus much concerning the *Palſie*, in which the loco-motive faculty is aboliſhed or loſt, or very much hindered; by reaſon of the ways of the Spirits being obſtructed, and themſelves affected with a certain ſtupefaction, in the whole, or in the reſpective parts. There follows another kind of this Diſeaſe, depending upon the want and fewneſs of Spirits, in which, although motion be not deficient in any part or member wholly, yet it is not performed by any but weakly and depravedly only. For though the diſtemper'd are free from want of motion, they are not able however to move their members ſtrongly, or to bear any weight; moreover, in every motive indeavour, they labour with a trembling of their limbs, which is only a defect of debility, and of a broken ſtrength in the motive power. For when ſtrength is wanting for the lifting up of any member firmly, and at one eſſay or endeavour, Nature flagging, acts with a more often repeated tryal or endeavour, and ſo the part being in motion, is compelled as it were to ſhake and tremble. To which happens, that when the nervous Fibres flagging or growing weak, they are not able to ſuſtain the Tonick endeavour, or the ſtiffneſs in the Animal regiment, and theſe endeavouring or ſtriving to exert or put forth their utmoſt power, enter into motions as it were Convulſive, and reiterate them perpetually. Wherefore, in ſome *Paralyticks*, there is always a trembling and ſhaking in all the limbs.

Thoſe who thus become *Paralytick*, by the paucity or want of Spirits, and ſo from their ſmall or diminiſhed diſpenſation into the nervous *Syſtem*, are made obnoxious to ſuch a Diſtemper, by reaſon of various cauſes and occaſions.

Firſt,

Firſt, Extream or unhealthy old age, or immoderate loſs of blood, or the genital humor, induce this kind of *Paralytick* diſpoſition in many men; to wit, becauſe from the waſted blood and almoſt liveleſs, there is ſtilled forth into the Brain but a very ſmall ſtock or proviſion of Animal Spirits. *For this Reaſon Old Men are obnoxious to this Diſeaſe.*

Secondly, Almoſt for the ſame reaſon, the loco-motive faculty grows weak or fails in perſons greatly *Scorbutick*, and ſuch as are full of indigeſted juice; for ſuch not being fit for any ſtrong exerciſe, go infirmly and weakly, and are very much tired by any long or ſwift walking; further, by any more heavy endeavour, they ſuffer often times a numneſs in their limbs, with an impotency of moving them. For indeed, the bloody Maſs is in theſe very watry, and ſtuft with impurities, and for that the Brain being weak and looſe, as to its Pores, admits eaſily all ſorts of filthineſſes into it ſelf; wherefore, fewer Animal Spirits being only created, and thoſe not clear and ſubtil, but dull and hindred, by the adheſion of a more thick matter (although there is not always an obſtruction of the ways, or a *Narcotick* diſpoſition) they are not able to unfold themſelves into motive endeavours. *2. Alſo Scorbutical Perſons, and ſuch as are full of ill humours.*

Thirdly, Not only *Scorbutical* perſons, but alſo many others, hardly and long growing well from ſome *Chronical* Diſeaſe, are diſtemper'd with Members very much looſened from their due vigor and ſtrength, and with a languiſhing of their Limbs; that though they are well in their ſtomach, and have a good and laudable Pulſe and Urine, yet they are as if they were enervated, and cannot ſtand upright, and dare ſcarce enter upon local motions, or if they do, cannot perform them long: yea, ſome without any notable ſickneſs, are for a long time fixed in their Bed, as if they were every day about to dye; whilſt they lye undiſturbed, talk with their Friends, and are chearful, but they will not, nor dare not move or walk; yea they ſhun all motion, as a moſt horrid thing. Without doubt in theſe, although the Animal Spirits do after a manner actuate and irradiate the whole nervous Stock, yet their numbers are ſo ſmall, and in ſo few heaps, that when as many ſpirits ought to be heaped together ſomewhere in it for motion, there is great danger leſt preſently in the neighbouring parts, their continuity ſhould be broken. Wherefore, when the ſpirits inhabiting the Brain, are conſcious of the debility of others diſpoſed in the Members, they themſelves refuſe local motions, for that it would be too difficult a task to impoſe on their companions; wherefore, the ſick are ſcarce brought by any perſwaſion, to try whether they can go or not; Nevertheleſs, thoſe labouring with a want of Spirits, who will exerciſe local motions, as well as they can, in the morning are able to walk firmly, to fling about their Arms hither and thither, or to take up any heavy thing; before noon the ſtock of the Spirits being ſpent, which had flowed into the Muſcles, they are ſcarce able to move Hand or Foot. At this time I have under my charge a prudent and an honeſt Woman, who for many years hath been obnoxious to this ſort of ſpurious *Palſie*, not only in her Members, but alſo in her tongue; ſhe for ſome time can ſpeak freely and readily enough, but after ſhe has ſpoke long, or haſtily, or eagerly, ſhe is not able to ſpeak a word, but becomes as mute as a Fiſh, nor can ſhe recover the uſe of her voice under an hour or two. *3. Alſo others long ſick.* *Hence ſome dare not venture on local motion.* *Others indeavouring, cannot bear them long.*

In this kind of ſpurious *Palſie*, ariſing from the defect, or rather the weakneſs of the Animal Spirits, than from their obſtruction, it may be ſuſpected, that not only the Spirits themſelves, as to their firſt numbers of them, and particular originals, are in fault; but beſides, that ſometimes the imbecillity and impotency of local motion, doth in ſome meaſure alſo depend upon the fault of the exploſive Copula, ſuffuſed every where from the blood, into the moving Fibres. For indeed, from a very *Cacochymical* blood, or full of juice, and for that cauſe vappid, and liveleſs; as the Animal Spirits are but few, that are inſtilled into the Brain, ſo it is probable, that thoſe themſelves derived from the Brain, into the Nerves, being diſpoſed at length within the muſcular Fibres, do meet with other Nitro-ſulphureous Particles (which we have ſomewhere ſhown to be neceſſarily required to the Muſculary motion) from the ſo vitious blood that are but dull, and degenerate, from the Elaſtick power; wherefore indeed the Spirits being concreted ſo evilly within the Muſcles, even as Gunpowder being full of more thick feculences, rarely and weakly perform the acts of exploſions. *The Impotency of the Spirits proceeds in ſome meaſure from the default of the exploſive Copula.*

As to what belongs to the other ſpecies of the *Palſie*, in which the ſenſitive faculty is alſo affected, we ſay, that this is hurt either by it ſelf, or together with the motive; and ſuch an hurt of both together, doth almoſt only happen, foraſmuch as the paſſages and ways of the Spirits are more firmly ſhut up, ſo that whether they tend forward or backward all their irradiation is intercepted: That ſometimes happens, though rarely from the Morbific matter fallen down from the Brain into the oblong Marrow, but more often by reaſon of a grievous hurt of the Spine or Back-bone, *2. The kind of Palſy, in which Motion and Senſe are hurt at once.*

as from a fall from on high, ſtroke, or wound inflicted on them? For from ſuch occaſions, by compreſſing the marrowy cord, or by too much diſtending or writhing it, all the tracts of the Spirits are blotted out.

3. Kind, in which ſenſe only is affected.

Sometimes the ſenſitive faculty is hurt by it ſelf, the motive being ſtill ſafe; this is ſufficiently obvious, and the reaſon very clear, of the organs, whoſe Nerves are only ſenſible, to wit, as of the ſight, hearing, taſt, and ſmell. But indeed, that in the extream habit of the body or members, the touch or feeling ſometimes periſhes, the loco-motive power being unhurt; as is ordinarily diſcerned in Lepers, thoſe diſtemper'd with the *Elephantiaſis*, and ſome Mad-men, who are wont to go naked, and lye on the ground, whoſe skin and muſculous fleſh are ſo benumned, that they feel not the gaſhes made in their fleſh with a Pen-knife, nor Needles any where thruſt into them; this I ſay ſeems very hard to be unfolded. But as to this it may be ſaid, that perhaps the ſame Nerves, carry the inſtincts of motions, and the impreſſions of ſenſible things forward and backward, or to and fro, but that the ſame Fibres, which are loco-motive, are not altogether or chiefly ſenſible. We have elſewhere ſhewed, that its power is performed by the tendinous and muſculous Fibres; but the ſenſible Species, is almoſt only received by the membranaceous Fibres; wherefore, the outer skin is the primary organ of feeling; after this, the Membranes covering the Muſcles, and laſtly thoſe conſtituting the Viſcera, are ſomewhat affected by the Tangible object. Wherefore, the loſs or hurt of feeling ariſes, by reaſon of an hurt, brought to the exterior Membranes; to wit, when the Fibres of theſe are obſtructed by a *Vitriolick* matter, or are benummed very much by exceſs of cold; ſo that the Animal Spirits, which ought to receive their impreſſions, are excluded from their organs. And indeed, from hence it appears, that theſe inhabiting the exterior Membranes, are only affected, becauſe ſenſe being loſt, the members wither not, as when deprived of motion, but remain full and round; which is a ſign that the Animal Spirits entring ſtill the Nerves, and fleſhy Fibres, do contribute their virtue to the office of nouriſhment; after what manner we have already ſhewn; but when motion is loſt, the Spirits are almoſt wholly baniſhed from thoſe parts, and the fleſh conſumes, becauſe the nouriſhing matter, though carried thorow the Arteries, is not aſſimulated. We have largely diſcourſed of this in our Treatiſe of the Nerves.

Wherefore feeling is ſometimes loſt, and motion ſafe.

What is the proper Organ of feeling.

The Prognoſtick of the Palſy.

The Theory of this many-form'd Diſeaſe being now at length finiſhed, its kinds and differences, all, or at leaſt the moſt and chiefeſt of it, together with the reaſons of each of them, being rehearſed in order, we ſhall ſhew next thoſe things which belong to its prognoſticks and Cure.

1 Every *Palſie*, whether accidental or habitual, and either of them, whether univerſal or partial, or whether ſuddenly excited or by degrees, if it happens that the knowing and vital faculty be unhurt, it ought not to be accounted an acute Diſeaſe; but being free from ſudden danger, admits a long Cure, or at leaſt an endeavour of it.

2. This Diſeaſe coming from a ſolitary evident cauſe, as from a ſtroke, a fall, wound, *&c.* or coming upon the *Apoplexy*, *Carus*, *Convulſion*, the *Colick*, or other Diſtempers of the Brain, or nervous *Syſtem*, if it be not in a ſhort time altered for the better, or gives not place to Medicines, it remains for the moſt part incureable.

3. If that a total reſolution follows, from a total obſtruction in the beginning of the oblong Marrow, or from the Back-bone being vehemently hurt, and that ſenſe and motion are both taken away, the Diſtemper is hardly, or ſcarce at all to be Cured.

4. Thoſe who are once cured of a *Palſie*, ariſing from an evident ſolitary cauſe, do not ſo eaſily relapſe into the ſame, as when the Diſeaſe depends upon a *procatartick* cauſe.

5. A *Palſie*, happening to men of years, to *Cacochymical*, very *Scorbutical*, and intemperate perſons, although the Diſtemper be not very great, is difficultly Cured.

Its Cure.

As the *Palſies* are manifold, and are from diverſe cauſes, ſo the Cure is not to be inſtituted always after one manner, but after a various method, to wit, appropriate to every kind of this Diſeaſe. For the moſt part there are theſe three kinds of it, or rather there are three means of healing; of which there ought to be had concerning the Cure of this Diſeaſe, now this, now that, or now another; to wit, becauſe reſolution (whatever, or in what place ſoever it be) is either cauſed, 1. from an external accident, as a ſtroke, a fall, a wound, exceſs of cold, or the like, ſuddenly: Or 2. It ſucceeds to ſome other Diſtemper, as the *Apoplexy*, *Carus*, *Colick*, or a long Feavour: Or, 3. It is primary and a Diſeaſe by it ſelf, by degrees excited, and depending upon a *procatartick* cauſe, or a previous proviſion. Concerning each of theſe, we ſhall ſpeak particularly.

Three means of healing, according to which this Diſeaſe is, 1. Either accidental; 2. The off-ſpring of another Diſeaſe; 3. Habitual.

1. Therefore

1. Therefore, when the *Palſie* is cauſed, by reaſon of ſome accident, with a vehement hurt, there are not many intentions of healing; but only that the part hurt may recover its priſtine conformation. And firſt of all, that the Blood and other humors flowing to it, being weak and diſtemper'd, and ſtaying there, might not increaſe the hurt, *Phlebotomy* is moſt requiſite in this caſe, and preſently to be celebrated; then the belly being made ſlippery by the uſe of Clyſters, and a ſlender dyet, if the matter requires it, let there be inſtituted either eaſily digeſted meats, or moderate *Hydroticks*, or water meats; to wit, that whilſt the ſick is kept in bed, he may continue in a gentle ſweat, that all the ſuperfluities may copiouſly exhale from the hurt part, and that the Spirits being gently agitated, may repeat their former ways and tracts, within thoſe Pores and paſſages, ſo unlocked by the warm Effluvia's. *1. The Cure of the former.*

For this end, the Powder *ad Caſum*, deſcribed in the *Auguſtan Pharmacopœa*, or as it is in ours, is of common uſe; let there be given of *Iriſh* Slate, to the quantity of about a dram, in a draught of white Wine warm'd, or of Poſſet-drink made of it; and repeated every ſix or eight hours. Beſides, if there be at hand the *Decoctum Traumaticum*, let it be taken ever now and then, frequently in Poſſet-drink, or a Decoction of the Roots of Madder, or of Butter-bur, or of St. *Johns-wort* Flowers. *A Powder for a Fall.*

Further, in the mean time, let the diſtemper'd part be carefully lookt to, which may be eaſily known, partly from the hurt inflicted, and partly from the looſened members. If there be any thing diſlocated in it, you muſt take care that as ſoon as it can, it may be put again in its place; if a Tumor, Contuſion, or a wound be excited, they are to be ſuccour'd by *Balſams*, *Liniments*, Stuphes or Fomentations, or Pulteſſes: But if nothing preternatural appears outwardly, let a Plaſter of *Oxycrocium* and of Red-lead, each alike, what will ſuffice, be laid upon it, and let the ſick be kept quiet, and in a moderate heat, for three or four days. If the reſolution remains confirmed, and the afflux of new matter be not feared, let more reſolving and diſcuſſing Remedies be applied to the diſtemper'd places; wherefore, make uſe of Fomentations, and hotter Oyntments, yea natural Baths, if they are at hand, or at leaſt artificial. Sometimes it may be expedient for the diſtemper'd Members to be wrapped in Horſe-dung, or in warm grains, and to be kept ſo for ſome time; and laſtly, between whiles, beſides the uſe of theſe, to add Clyſters and gentle Purges. But if no help follows theſe adminiſtrations, the ſick ought then to be handled with the like long method, and with the ſame Remedies, as thoſe that have an habitual *Palſie*, or any other coming upon other Diſeaſes and confirmed; which means of Cure, for every common *Palſie* more deeply rooted, ſhall be ſhewed anon. *Topicks to be applyed to the Diſtempered part.*

2. When the *Palſie* coming upon a *Feavour*, *Apoplexy*, *Carus*, or other *Cephalick* or Convulſive Diſeaſes, is greatly and ſuddenly excited, firſt the Phyſician ought to endeavour the taking away of the conjunct cauſe, which hath almoſt ever its ſeat in the oblong or ſpinal Marrow. Wherefore, at the beginning of the Diſeaſe, Blood-letting, and Purging (if nothing ſhews the contrary) Clyſters, Veſicatories, Cupping-glaſſes, Sneezing Powders, Oyntments, and other adminiſtrations uſed in *Cephalick* Diſeaſes, to wit, which by any means may ſhake off, or puſh away the deadly matter, fixed to the Medullary Trunk, or to the little heads of the Nerves coming from it, are to be made uſe of. If that at firſt, the force of Medicine effects nothing within fifteen or twenty days, for that the Diſtemper is radicated, and become habitual, it muſt be expunged by a long method, and equally by preſervatory as well as curatory Indications; of which we ſhall ſpeak anon. *2. How the Palſie coming upon another Diſeaſe is to be cured.*

3. The habitual *Palſie*, depending upon a *procatartick* cauſe, whether it be in *fieri* or in diſpoſition, or whether it be made, or in the neſt or bird, either requires a peculiar means of healing. *The Cure of the habitual Palſie.*

There are two chief cauſes of the former, in both which the Curatory Method, reſpecting only the fore-leading Cauſes, is deſigned after the like manner, to wit, whether any falling dangerouſly ill of the *Palſie*, or growing well of it, relapſes into danger, the ſame Remedies almoſt are to be inſiſted on. *Whilſt it is in fieri, or doing.*

The intentions therefore of healing are, Firſt, That the offices of *Chiliſication*, and of making of Blood, be rightly performed, and matter for the procreating the Animal Spirits be ſupplied, both laudable and ſufficient to the Head; then, Secondly, That the Brain being ſtill firm and well made, the heterogeneous Particles being excluded, it may admit all that are fitting, and rightly exalt then into Animal Spirits. For theſe ends, I think convenient to propoſe the following method, which ought to be varied, according to the various conſtitutions of the ſick, *The Intentions of healing reſpect the Blood and the Brain.*

In Spring and Fall, that they enter into the ordinary courſe of Phyſick, yea the whole year beſides, ſome Remedis are in conſtant uſe. Blood-letting is not always convenient to all men: But though we forbid this, it is not for the ſame reaſon with

the Ancients, ſuppoſing the *Palſie* to be a cold Diſeaſe, but becauſe the Animal Spirits, are both procreated out of the Blood, and become alſo Elaſtick in the motional Fibres, by reaſon of the bloody *Copula*; therefore, if plenty of this be taken away, they grow weak and deficient. Which thing indeed I have obſerved in many, and for the moſt part languiſhings and tremblings to have been begun in the Arm, out of which the blood had been taken. However in ſome, indued with a ſharp and hot blood, and apt to flame forth too much, though diſpoſed to the *Palſie*, it is ſometimes convenient to let blood a little and ſparingly.

Bloodletting.

A Purge.

About the *Æquinox*, a Purge ought to be inſtituted, and after due times between, to be iterated three or four times. But firſt, if nothing oppoſe, let a Vomit be given, of the Salt of *Vitriol*, *Sulphur* of *Antimony*, or an Infuſion of *Crocus Metallorum*, or of *Mercurius Vitæ*; then let there be taken Pills of *Amber*, or of *Alvephanginum*, by it ſelf, or with the *Reſine* of *Jalap*, every ſeventh or eighth day. At other times we preſcribe *Cephalick* Remedies, ſuch as in the ſleepy Diſeaſes: *viz. Electuaries*, *Powders*, *Spirits*, and *Volatile Salts*, *Tinctures*, *Elixirs*, with diſtilled Waters and *Apozems*, ſometimes theſe, ſometimes thoſe, or others. Let Iſſues be made in the Arm or Leg, yea in fat people, and ſuch as are full of ill humors, in both together, or between the ſhoulders. Let them drink all the year medicated Beer of Sage, Betony, Stechades, Saſſafras Wood, and Winterines Bark. Wine and Women ought to be forbidden, or but moderately to be uſed.

Cephalick Remedies.

2. How the Diſtaſe in habit is to be cured.

If that the *Palſie* be excited, after a previous diſpoſition, either of one ſide, or in ſome members, and that it ſtill continues, notwithſtanding the firſt attempt of Medicine, a long and complicated method is always requiſite, and oftentimes doth not ſuffice; for not only the Diſeaſe, or its conjunct cauſe, or its foregoing ſeverally, but all together ought to be oppoſed: for which ends *Phlebotomy* being for the moſt part interdicted, only a gentle Purge and rarely is convenient. Beſides, ſome chief *Cephalick* Medicines, and *Antiſcorbuticks* are wont to help againſt the foregoing cauſe of this Diſeaſe. But all of this ſort, are not convenient to all; yea as we have obſerved in the Scurvey, according to the various Conſtitutions of the Sick, there are alſo Remedies of a diverſe kind and virtue. For to *Cholerick Paralyticks*, to wit, in whoſe ſharp and hot Blood there is much of *Salt* and *Sulphur*, and very little of *Serum*, the more hot Medicines and indued with very active Particles, are not agreeable, yea are often hurtful; which things notwithſtanding are very profitable to Phlegmatick perſons, whoſe Blood is colder, and contains much of *Serum*, and but few active Elements. Wherefore, for this twofold ſtate or condition of ſick perſons, it ſeems convenient that we inſtitute here a double Method of Cure, and two claſſes of Medicines, of which theſe may be given to cold *Parlyticks*, and thoſe to the hot.

Bloodletting and Purging cautiouſly and rarely to be admitted.

Altering Medicines ought to be given with choice.

How the Palſy is to be healed in a cold temperament.

In the former caſe, for the taking away the *Procatartick* cauſe, after Vomiting and Purging being rightly inſtituted, I was wont to preſcribe according to theſe following forms.

Electuary.

Take *of the Conſerves of the leaves of the Garden Scurvy-graſs, of Rocket, made with an equal part of Sugar, each three ounces; of Ginger Candied in India half an ounce, of the rinds of Oranges and Lemons Candied, each ſix drams; of the Powder of the Claws and Eyes of Crabs, each four ſcruples; of the Species of Diambre two drams, of Winterins Bark, one dram and a half, of the Roots of Zedoary, the leſſer Galingal, of Cubebs, the Seeds of Water-Creſſes, Rocket, each one dram; of the Spirits of Scurvy-graſs, Lavender, each two drams; of the Syrup of Candied Ginger, what will ſuffice to make an Electuary. Take of it about the quantity of a Walnut, at eight of the Clock in the Morning, and at five in the Afternoon, drinking after it a pint of the following Decoction, warm, or Coffee, with the leaves of Sage boiled in it ſix ounces, or of Viper Wine three ounces.*

Coffee.

A Decoction.

Take *of the ſhavings of Lignum Sanctum ſix ounces, of Sarſaparilla, and of Saſſaphras, each four ounces; of white and yellow Sanders, of the ſhavings of Ivory, of Harts-horn, each half an ounce; infuſe them according to art, and boil them in ſixteen pints of Spring water, till half be conſumed, adding of Crude Antimony in Powder, and tyed in a rag four ounces, of the Root of the Aromatick Reed, of the leſſer Galingal, each half an ounce; of the Florentine Iris one ounce, of Cardamums ſix drams, of Coriander Seeds half an ounce, ſix Dates; make a Decoction to be uſed for ordinary drink.*

Spirits.

Going to ſleep, and firſt in the morning, *let a Doſe of the Spirits of Sut, or Harts-horn, or of Armoniacal Amber, or of Blood, &c. be taken, with three ounces of the following diſtilled water.*

A Diſtilled Water.

Take *of the leaves or roots of Avens one pound, of the leaves of Garden Scurvey-graſs,*

of

of the greater Rocket, of Roſemary, Sage, Savory, Thyme, four handfuls; of the Flowers of Lavender three handfuls, the outer rinds of ten Oranges, and ſix Lemons, of Winterans Bark three ounces, of the roots of the leſſer Galingal, of Calamus Aromaticus, the Florentine Iris, each two ounces; of Cubebs, Cloves, Nutmegs, each two ounces; all being cut and bruiſed, pour to them of white Wine, and of Brunſwick Beer or Mum, each four pints: diſtil it in common Stills, and let all the liquor be mixed together.

Tinctures and Elixirs.

Sometimes in the place of the Electuary may be taken for fifteen or twenty days a Doſe of the *Tincture* of *Sulphur* Turpentined, of the *Tincture* of *Antimony*, or of *Amber*: Alſo ſometimes *Elixir Proprietatis*, or of *Pœony*, let them be taken in a ſpoonful of diſtilled Water, drinking after it three ounces of the ſame: Alſo ſometimes the following Powders or Lozenges may be taken by turns, in the medical courſe.

Take *of the Powder of Vipers fleſh of Monpillier prepared one ounce, of the hearts and livers of the ſame half an ounce, of Species Diambre two ounces; make a Powder, take one dram once or twice a day with the diſtilled Water three ounces, or with Viper Wine, with a Decoction of the leaves of Sage, of the root and ſeeds of the Burdock, and the Candied roots of Eringo, made of Spring-water, what will ſuffice, and boiled to one moiety; ſix or eight ounces in the Morning warm, expecting to ſweat after it.*

Powders.

Take *of Bezoartick Mineral Solar half an ounce, of Cloves powdered two drams; mingle them, make a Powder and divide it into twelve parts, let one be taken after the ſame manner, twice in a day; between theſe kind of Remedies, gentle purging may be often uſed.*

Lozenges.

Take *of the Powder of the picked roots of Zedoary, the leſſer Galingal, each half a dram; of Species Diambre one dram, of the Powder of the ſeeds of Muſtard, Rocket, Scurvygraſs, Water-Creſſes, each half a dram; make of them all a fine Powder, add to it of the Oyl of the pureſt Amber half a dram, and with white Sugar diſſolved in the compounded Pœony water, and boiled up to the conſiſtency of Lozenges ſix ounces: make Lozenges according to art, weighing each half a dram: Eat of them three or four twice in a day, drinking after every Doſe, of the liquors before mentioned.*

Pills.

Take *of the Powder of Virginian Snakeweed two drams, of the leſſer Galingal one dram, of the gummed extract of the remains of the diſtillation of the Elixir Vitæ of Quercitan two drams, of the Flowers of Sal Armoniack, (or the moſt pure Volatile Salt of Sut or Harts-horn) one dram, of the Balſom of Peru one ſcruple, of the Balſom of* Capivus *what will ſuffice to make a maſs; let it be made into ſmall Pills involved in the Species Diambre. The Doſe is half a dram evening or morning.*

Take *of the Reſine or Gum of Guaicum three drams, of the Species Diambre one dram, of the Chymical Oyl of Guaicum rightly rectified one dram and a half, of liquid Amber what will ſuffice to make a maſs: let it be formed into Pills, to be taken after the ſame manner.*

How the Cholirick or hot Palſie is to be cured.

If that the Palſie happens in a Cholerick temper, or to a young Man, it admits only of milder Medicines, and all the more hot things, and *Elaſtick*, do but imbitter the Diſeaſe: The following forms are in uſe, for the taking away of its foregoing cauſe.

An Electuary.

Take *of the Conſerves of the Flowers of Betony, of Fumitory, of Primroſes, each two ounces; of the Species Diambre one dram, of Ivory, Crabs Eyes, and Claws, each four ſcruples; of the Powder of the Flowers of Pœony two drams, of Lignum Aloes, of yellow Sanders, each one dram; of the Salt of Wormwood one dram and a half, and with the Syrup of the Flowers of Pœony what will ſuffice, make an Electuary. The Doſe is two drams twice in a day, drinking after it, either the ſimple water of the Flowers of Aron, or of the following Compounded Water three ounces, or of the Decoction of Sage, with the leaves of Tea infuſed in it four or ſix ounces.*

A Diſtilled Water.

Take *of the Roots of Aron or Cuckopint, of the male Pœony, Angelica, Imperatoria, each half a pound; of the Flowers of Sage, Roſemary, Marjoram, Brooklime, Water-Creſſes, each four handfuls; of the rinds of ſix Oranges, and four Lemons, of Primroſes, Cowſlips, Marigold flowers, each three handfuls; let them be all bruiſed and cut, and pour to them of new Milk ſix pints, of Malaga Wine one quart; diſtil them in common Stils, and let the whole liquor be mixed together.*

Chalybeats or Steeled Medicines.

Sometimes inſtead of the Electuary may be taken between whiles, for fourteen or fifteen days, of the Syrup of Steel, of which let one ſpoonful be taken in three ounces of the diſtilled Water: It may be made after this manner.

Take *of the whiteſt Sugar diſſolved in black Cherry Water, and boil'd up to a conſiſtency, eight ounces, adding to it of our Steel in Powder three drams; let them be ſtirred together over the fire, and then by degrees pour to it of the Water of Roſemary warm twelve ounces; let it boil gently for a quarter of an hour, ſcumming it, and pouring it forth warm thorow an hair ſieve or ſtrainer.*

There may be alſo made ſteeled Lozenges after this manner, to wit, with Sugar ſufficiently boiled with Steel, adding of the Chymical Oyl of Amber or of Roſemary half a dram, and preſently let it be poured forth that it may flow into a conſiſtency of Lozenges: The Doſe is two drams twice in a day, drinking after it of diſtilled Water, or of the following Apozem ſix ounces.

A Decoction. Take *of China Root one ounce, of the ſhavings of Ivory, Harts-horn, each half an ounce; of white and yellow Sanders, of the Wood of the Maſtick-tree, each half an ounce; let them be infuſed in warm water and cloſe ſtops for a whole night, ſix pints; in the morning add to them of the Roots of Chervil, of ſweet ſmelling Avens, of Broom, and Parſley, each one ounce and a half; of the dryed leaves of ground Ivy, Sage, Germander, Betony, each one handful, of Coriander ſeeds three drams; let them be boiled till half is conſumed, then add to it of white Wine half a pint, and ſtrain it into a jugg, upon the leaves of Water-Creſſes bruiſed two handful: Let it infuſe warm and cloſe ſhut, for two hours, ſtrain it again, and keep it in a cloſe Veſſel well ſtopt.*

In the Scorbutick *Palſie*, the Juices and expreſſions of Herbs, do often bring notable help.

The juice and expreſſions of Herbs. Take *of the leaves of Brooklime, Water-Creſſes, and Plantan freſh gathered, each four handfuls, bruiſe them together, and pour to them of the diſtilled Water but now deſcribed eight ounces, ſqueeſe the juice ſtrongly forth, and keep it in a glaſs, and take of it twice or thrice in a day three or four ounces.*

At the extream Phyſical hours, *viz.* Morning and Evening, may be taken theſe following Pills.

Pills. Take *of Millipedes prepared three drams and a half, of Pearls one dram and a half, of the Root of the Cretick Dittany one dram, Venice Turpentine what will ſuffice to make a maſs: let it be formed into ſmall Pills, the Doſe is half a dram, drinking after it a draught of the diſtilled Water.*

For ordinary drink, let there be preſcribed, either a Bochet of Sarſe, China, yellow Sanders, *&c.* or ſmall Ale, with the dryed leaves of ground Ivy, boiled in it; and of Sage, with the Wood of Saſſafras, infuſed therein.

2. Whilſt theſe things are doing, for the taking away the foregoing cauſe of the Diſeaſe, there is no leſs a curatory care required, for its conjunct cauſe; to wit, that all obſtructed places being opened, they might admit the Animal Spirits, free from ſtupefaction, and that they may paſs freely thorow.

Topick and particular Remedies. There are two chief kinds of Remedies, which conduce to thoſe ends, *viz.* one particular and private, to be applied to the diſtemper'd places: to wit, that by Fomentations, Oyntments, Plaſters, and ſuch like outward applications, the ſleepy Spirits might be awakned, and their paſſages opened: the other univerſal, to wit, that the Blood and Spirits, and the other humors (and the active Particles flowing in the whole Body) being very much agitated, and put into a rapid motion, like a torrent, they might caſt down and remove all impacted heaps or ſtays, by which the Spirits are obſtructed.

The adminiſtrations uſed to the diſtempered parts are ſo ordinarily and commonly known, that it were ſuperfluous to inſiſt here on the deſcribing them more largely. Firſt *Liniments*, made out of Oyls, Oyntments, and Balſoms, are to be applied according to the temper of the Patient, more or leſs hot, and with frictions or ſtrong rubbing twice a day. Sometimes, before theſe are made uſe of, Fomentations made of *Cephalick* Herbs, or ſpices boiled in Spring Water, adding to it ſometimes Strong Waters, Wine, or Bear or their Lees. Further, oftentimes it is convenient to make about the diſtemper'd places Bliſters, and to uſe Cupping-glaſſes, and Medicines to take away the hairs, and to raiſe pimples. Little Bags and Plaſters often help. Moreover, if the buſineſs will admit it, let the *Paralytick* members be covered over with hot

hot grains, or with the refuſe of the Grapes when flung out of the Wine-preſs; or let them be thruſt into the belly of a Beaſt new ſlain, or bathed in an artificial Bath, or in the natural Baths, and be kept for a long while in any of theſe.

Univerſal Remedies.

But if theſe help not, you muſt then come to univerſal Remedies, or great Remedies; of which ſort, in the firſt place, are *Diaphoreticks* or ſweating Medicines, *Mercurial* Medicines ſtirring up Salivation; and ſtrong Vomiting Medicines: of each of which we ſhall ſpeak briefly.

1. Diaphoreticks.

In the Cure of the *Palſie*, ſometimes *Diaphoreticks*, or Medicines cauſing ſweats, do very much help; and that they ſometimes are hurtful, the common people do ordinarily obſerve. Wherefore it is very requiſite, that we ſhould unfold the reaſons of this ſo different effect; and that ſo indications may be taken as to the uſe or rejection of them.

They are not to be adminiſtred indifferently to all.

Therefore, a plentiful ſweating is wont to be helpful ſometimes to *Paralyticks*, chiefly for two reaſons; to wit, for that it doth thruſt forth or exterminate in a great meaſure the impurities of the Blood, and the nervous juice, being apt to breath forth; ſo that the Morbific matter doth not flow any more to the Brain, and the diſtemper'd parts; and that whatever hath already flowed forth from them, is partly conveyed forth of doors. Then, Secondly, Becauſe the Effluvia's of heat falling away from the boiling blood, do very much open the nervous Paſſages before obſtructed, whilſt in evaporating they paſs thorow them, and make an open way for the Spirits. Wherefore this adminiſtration is chiefly and almoſt only convenient for thoſe, whoſe Blood is not ſtuffed with fixed Salt and Sulphur, but is diluted with a limpid and ſaltleſs Serum. For on the contrary, *Paralyticks* whoſe blood and humors are full of fierce, Exotick, and fixed Particles of enormous Salts and Sulphur, and unfit to be exhaled, do often receive great harm by a violent and forced ſweating. Of this kind of effect we have aſſigned theſe two cauſes, to wit, becauſe that the Morbific Particles, by reaſon of agitation being too much exalted, become more outragious; then ſecondly, becauſe theſe being more plentifully brought to the Brain and nervous Stock, they oftentimes increaſe the old obſtructions, and not rarely produce new.

They often hurt the Cholerick.

That a plentiful ſweating or *Diaphoreſis* may be eaſily provoked, both internal Medicines, and outward adminiſtrations are wont to be made uſe of. The former ſtir up either the Blood or Serum into an heat, or provoke the heart into more ſwift motions; and for that cauſe (whether one or both be done) when the bloody liquor is rapidly circulated thorow the Heart and Veſſels, and is wrought into a frothy ſwelling up, there is a neceſſity, that very many Effluvia's, which are the matter of ſweat, ſhould go away from it. For this end, Medicines of a various kind are commended to *Paralyticks*, of which the moſt noted are, a Decoction of *Guaicum*, *Sarſaparilla*, *&c.* Spirits and Oyl of *Guaicum*, the ſimple mixture, Flowers and Spirits of *Sal Armoniack*, *Aurum Diaphoreticum*, the Salt of *Vipers*, as alſo the Powder and Wine of the ſame: the ſolar *Bezoartick mineral*, Tincture of *Antimony*, *&c.*

Sweating Medicines.

External adminiſtrations move ſweat, becauſe they hold in, and ſtir up the moderate heat in the whole body; and ſo the blood being made hot, is compelled to move more ſwiftly, and to evaporate more, and at the ſame time, the Pores of the skin, being unlocked, readily let forth all the Particles that are apt to exhale. For this uſe, beſides the Bed-cloaths (which only hold in the Effluvia's of heat ſent from the body, about it ſtill) there are little ſweating Chairs, or Stoves, made hot with Coals or with the Spirits of Wine: alſo Hot-houſes and Baths of various kinds and forms, and our natural Baths, are wont to be made uſe of: But of all of them, our natural Baths of the *Bath* (if they agree with the temper of the ſick) are thought to be the beſt Remedy; which the many Crutches, hung up as ſo many trophies of this Diſeaſe being overcome, belonging to many Cured of the Palſie, do ſufficiently ſhew.

Stoves, Baths, Natural Baths.

When the uſe of Baths is hurtful in the Palſie.

But as the beſt Medicines, if they prove not a Remedy to the Diſeaſe, often paſs into poiſons; ſo the uſe of *Baths*, when it cures not ſome *Paralyticks*, renders them much worſe; ſo that when as the ſick had before many members diſtemper'd and reſolved or looſened, there was no other occaſion for them of leaving behind them there their Crutches, unleſs it were becauſe they could uſe them no longer. We have above ſhewed the cauſe of this; to wit, becauſe bathing, ſhaking, or moving the blood, and all the humors, more exalts all the Morbific and extraneous particles, and they becoming more outragious, drives them from the Viſcera into the bloody maſs; from whence (when they cannot eaſily evaporate) entring into the Brain and nervous Stock, increaſe the *Paralytick* Diſtemper, and very often adds to it the Convulſive. For this reaſon Bathing ſometimes actuates or ſtirs up the *Nephritick*, and the Gouty diſpoſition; and further, in many where there was not a diſpoſition, it cauſes a ſpitting of blood, the *Aſthma*, or Conſumption. Wherefore Baths ought not to be tryed without

without the advice of a *Phyſician*, and then having tryed them, if they ſeem not agreeable, they are to be ſoon left.

Salivation. I have by my own experience ſufficiently try'd, and known alſo by that of ſeveral other *Phyſicians*, that ſome *Paralyticks* have been cured by Salivation excited by *Mercury*. But I think this kind of Remedy, is only to be uſed to the habitual *Palſie*, to wit, which hath its foregoing cauſe in the Blood and Brain, eaſily moveable, and its conjunct cauſe, in the nervous appendix, not very fixed. But when this Diſtemper is cauſed from an outward and great hurt, or follows upon the *Carus*, *Apoplexy*, or *Convulſions*, a Salivation or ſpitting is attempted in vain, and ſometimes not without great hurt. But whoever are indued with a weak and too looſe a Brain, and are obnoxious to frequent Convulſive motions, are not raſhly to make uſe of *Mercury*. Yet ſometimes a Salivation in an habitual *Palſie*, and not very fixed, hath highly profited, forasmuch as by taking away the impurities of the blood, it cuts off all the nouriſhment of the Diſeaſe; alſo, becauſe ſome *Mercurial* Particles, whilſt paſſing thorow the Brain, and entring the nervous paſſages, divide the Morbific matter impacted in them, and drawing its parts one from another, variouſly diſperſe ſome forward, and others backwards; when oftentimes it is the fault of other Medicines, that they only urge forward the heap obſtructing the ways of the Spirits, ſo that if they pull it not to pieces, they drive it more firmly into the obſtructed places.

Vomitories. In ſome meaſure it is for this reaſon alſo, that Vomits do frequently yield notable help in the Cure of the *Palſie*, to wit, becauſe they draw away the nouriſhment of the conjunct cauſe, yea and do not always drive forward, but pull back the matter impacted in the Nerves, do greatly ſhake, and often break it in bits; ſo that when the continuity of the heap is broken, the Animal Spirits themſelves eaſily diſſipate the Particles of the Morbific matter, looſened one from another. We have before mentioned another reaſon of the help of *Emeticks* in the Sleepy Diſeaſe, which alſo may have a place in the *Palſie*.

Hiſtories and Examples of Paralyticks. Inſtances and examples of *Paralyticks* are ſo ordinarily and almoſt daily met with, that their various Types and Hiſtories would fill a Volume, if they ſhould be deſcribed. Wherefore I ſhall only add here ſome few and more rare ones, to wit, one or two, by which the chief kinds of this Diſeaſe may be illuſtrated. For as it will be little to the purpoſe, to deſcribe the reſolutions of members, excited by outward accident, as from a fall, wound, or ſtroke; I ſhall inſiſt only on thoſe caſes, where the *Palſie* either ariſes by its ſelf, after a previous diſpoſition, or comes upon ſome other Diſeaſe.

The Example of the Palſie habitual, excited of it ſelf. *The firſt Hiſtory.* Some time ſince, a certain Gentleman, ſtrong, and well fleſh'd, and beyond the tenth luſtre of his age, almoſt ever healthful; at length being given to a ſedentary and idle life, and from thence becoming more dull and heavy than uſual, refuſed any exerciſe, and more hard motion of the body: moreover he was wont to be melancholick and ſad, upon any light occaſion, yea ſometimes to break forth into weeping and tears, without any manifeſt occaſion. This man a little after (which I alſo obſerved in many others) was diſtemper'd with an imbecillity and trembling of all his members, and then with a reſolution of the lower parts; to which Diſeaſe (for that he was melancholick, and ſoon weary of Medicines) he gave himſelf up as overcome, and by degrees being made more weak and languiſhing, he dyed within ſix months.

I remember many others, but eſpecially two committed to our Cure, who were highly ingenious and very learned, in the former part of their life; but afterwards in their declining age, partly through the evil diſpoſition of the body, and partly through the perturbation of the mind, became dull and forgetful, and after that (notwithſtanding the uſe of the Remedies in the beginning of the Diſeaſe) *Paralytick*.

The Reaſon of it. In theſe kind of caſes, firſt the Brain it ſelf, as to its temper and make, ſeems to be ſo weakened, that the Spirits inhabiting it, becoming torpid, and wandring out of their tracts, did not rightly perform the acts of Memory and Imagination; then by reaſon of their failure and diſorders in their firſt ſpring or fount, (which are not enough taken notice of till they become uncureable) there is a neceſſity, that an impotency or an eclipſe of the motive faculty, ſhould ſucceed in the nervous appendix. But the Cure of theſe Diſtempers, as often as they are excited from ſuch an occaſion, is ever very difficult, becauſe the antecedent cauſe is hardly or ſcarce ever taken away.

The ſecond Hiſtory more rare and notable. A young man, of a Sanguine temper, ingenious, and for the moſt part healthy, ſitting in a Chair after a large ſupper, and immoderate drinking of Wine, was ſo diſtemper'd with a numneſs or ſtupidity in his right hand, that his Gloves which he held in it, fell of themſelves out of his hand; then getting up, and endeavouring to walk, he felt a reſolution or looſening in his Thigh and Leg of the ſame ſide, and a little

a little afterwards falling into a certain hebetude or dulness of mind, and stupefaction, yet without an *Apoplexy*; for he was still himself, answering aptly to questions asked him, though but slowly and with difficulty, and doing those things that were bid him. Presently a skilful *Physician* being sent for, *Phlebotomy*, Vomiting, and Purging, were celebrated in order, Cupping-Glasses, Scarification, Ointments, Frictions, and other fit administrations were carefully applied: Nevertheless the *Palsie* increased, that besides the motion of his members on the right side being taken away, he also lost the sight of that eye; yet still being stupefied and sleepy, he was *compos mentis*, and knew his Friends, and being conscious of his infirmity, and solicitous for the recovering his health, he took all remedies were given him; but notwithstanding all this, the animal functions daily more and more languished, and at length by their consent the vital; so that about the seventh or the eighth day, from thence, falling sometimes into a Delirium, and sometimes into Convulsions, or other distractions of the Animal Spirits, his strength being at length quite lost, he yielded to Death.

His Head being opened, the anterior cavity of the Brain was filled, partly with Ichorous Blood, partly concreted and in clodders or gobbets, with plenty of Serum: Hence, as it is easie to conceive, from this deluge, pressing upon one of the Streaked bodies, and binding up its Pores and Passages, the flowing of the Spirits into the nervous appendix of that side was hindred, and for that reason, the resolution in the respective members was excited; and because of the *optick* chamber, where it is inserted into the Streaked Body, being also pressed together, the Eye of that side lost its sight; further, because the *Callous* Body, chambring that den, was somewhat pressed by the heaped matter, from thence the hebetude and stupefaction of the chief functions of the soul were excited, yet without their subversion or inordination. By reason of the evil being fixed on the substance of the Brain, and the Spirits inhabiting it, these sorts of Distempers do proceed, and not from the impletion of the Ventricle, as appears clear enough by this instance, and by what we have elsewhere mentioned. *An Anatomica Observation, by which the Case is explained.*

A Servant to a certain Nobleman, being about forty years of Age, indued with a sharp Blood, and Cholerick temperament, and for some time obnoxious to the *Vertigo*, whilst he was riding in the Country to a certain Village, being taken suddenly with a dizziness in the Head, he fell upon the ground headlong, and being instantly taken up by the inhabitants, and put to bed, he lay for many hours insensible, and as if dead. But afterward being awakened, he felt an universal *Palsie*, and all his members loosened on both sides. Visiting this Man the day after, I took from him presently about twelve ounces of Blood, and prescribed forthwith some other Remedies, both outward administrations and also inward Medicines to be carefully given him; and indeed with good success; for after five or six days, he began to bend and stretch forth his hands, and feet, yea, though slowly, to move them about hither and thither; then by the constant use of Remedies, within two months, he was able to rise up, to stand on his feet, and to walk a little with the help of Crutches; then using at home for some time daily a temperate artificial Bath, he got strength and motion by degrees in his members; at length as soon as the season of the year served, going to the *Bath*, within a fortnights time, by the use of the Baths, he grew perfectly well, and leaving his Crutches behind him returned whole. *The third History.*

In this case, the *Apoplectick* matter falling down out of the middle of the Brain, being divided and largely poured forth, entered both the Streaked Bodies, and so caused the universal *Palsie*; but forasmuch as being more stretched abroad, the same was the less thickly impacted in the Marrowy Pores, therefore being more moveable, and apt to be shaken off, it did admit so easie and quick a Cure. To this man the more hot Remedies were not agreeable, so that I was compelled sometimes to iterate *Phlebotomy*, and to give him only temperate Medicines. That the *Palsie* doth sometimes succeed, not only *Cephalick* Distempers, but also the *Colick*, and *Scurvey*, (as we have already hinted) the following History, (of which we have somewhere made mention as to its *Scorbutick* reason,) will manifestly declare. *The Reason of this.*

A young and handsome Woman, after being brought to bed, fell into a Tertian *Feavour*, this coming at length daily upon her, and protracted, brought in a most cruel and continual *Colick*. The pains at first tormented her only in her Belly, with vomiting and most sharp torments. Being a long while vexed with these, and almost worn out; at length she began to be molested with a stupefaction, and a sense of tingling, such as comes upon a member laid upon. Nor was it long after that but a *Palsie* (which this other Distemper very often forerunns) follow'd in her whole Body. In this condition being brought to *Oxford*, she was committed to our Cure (the noted *Physician* Dr. *Lydell* being also called to our assistance.) In this sick Gentlewoman, not only all her greater Members, as her Arms and Legs, but almost every *The fourth History.*

lesser

leſſer joynt or limb, was almoſt wholly looſened, that ſhe could not move hand nor foot, or the fingers or toes of either. Further, ſhe was ſo diſtemper'd with a waſting away, that ſhe was nothing but skin and bones, however (and from which only we had any hopes) ſhe had a good Pulſe, and a lively aſpect.

The Cure expoſed. After we had adminiſter'd to her for many weeks, moſt choice Medicines, both *Antiparalytick* and *Antiſcorbutick*, almoſt of every kind, and according to the various methods, without any ſucceſs; at length we propoſed to her, and to her Friends, *Salivation*, as the moſt powerful, though alſo moſt dangerous of all other Remedies; they not long deliberating upon it, reſolve to try a Medicine rather doubtful than none, and though the ſame ſhould be wholly ineffeacious. Therefore by God's help, we gave her in a ſmall Doſe, precipitate of *Mercury cum ſole*, and the next day repeated it. On the third day, a moderate and eaſie Salivation beginning, gently ſucceeded for a week, without any malignant *ſymptom*; but then the ſick complaining of a grievous Headach, and *Vertigo*, began to be afflicted with Convulſive motions; ſo that there was a neceſſity to let her lye down, and depreſs the Salivation, and as ſoon as we could, to break off this courſe, by the Serous Flux of water being called away from the Head, to the other parts; which indeed Clyſters, frequently given, *Epiſpaſtick* or drawing and revulſive Plaſters, applied to ſeveral places, together with Cordials and Opiates inwardly given her, did quickly effect; and then preſently this Gentlewoman finding her ſelf a little better, began to ſtretch forth and bend her fingers and toes, and ſometimes to move her members from one place to another. Her ſpitting ceaſing, being gently purged, ſhe took for many days a Decoction of *China*, *Sarſa*, *Saunders*, *Ivory*, *&c.* with the addition of the dried leaves of Betony, Sage, female Betony, *&c.* and between whiles with that, Spirits of Harts-horn, or of Sut, *Cephalick* and *Cardiack* Confections, alſo Powders and proper *Juleps*. Within a months ſpace, being held up by her Servants, ſhe could ſtand on her feet, and walk a little in her Chamber; moreover, ſleeping and eating moderately, ſhe every day got fleſh and ſtrength, and at length by the uſe of the temperate Bathes at the *Bath*, ſhe grew well.

The Reaſon of it. The reaſon of the aforeſaid caſe ſeems to be after this manner: Firſt, the vitious blood had contracted an intermitting Feavour, then by reaſon of the long ſtay of that Feavour, the ſame being made more vitious, did alſo impart its evil to the Brain and nervous Stock; the matter being poured forth from the blood on them, together with the nervous juice, being only at firſt *Spaſmodick* or Convulſive, and entering much into the *Intercoſtal* Nerves, excited the *Colick*; but then, that being more largely poured forth into the Nerves of the *ſpinal* Marrow, brought on painful contractions in the nervous Fibres, in almoſt the whole habit of the Body; and when from the aſſiduous and plentiful incourſe of the Convulſive matter, the paſſages of the Brain and Nerves being very much unlock'd, became very open; at length the more thick and *vitriolick* Particles entering with them, diſſeminated the *Paralytick* Diſtemper thorow the whole Body. Concerning its Cure, the Remedies uſed before Salivation did not profit, becauſe they urging this Morbific matter ſtill forward, drove it more deeply and cloſely into the nervous paſſages; but the *mercurial* Particles, becauſe they diſſolved the matter ſo compacted, firſt opened the way of Cure, which afterwards being much helped daily by *Cephalick* Medicines, it was at length conſummated by the uſe of the Baths.

The fifth Hiſtory, ſhewing when the Baths are hurtful. But that Baths are not profitable to all *Paralyticks*, yea (as we ſaid above) very hurtful to ſome, this following Hiſtory (whoſe mournful *cataſtrophe* happened whilſt we were writing theſe) will manifeſtly declare. A Merchant of *London* having put his foot out of joint, became upon it lame in that part, but as to all things elſe he was ſound and ſtrong enough; when he had tried for ſome time ſeveral kinds of *Topick* Remedies, and they effecting nothing; at length, by the counſel of a *Phyſician*, going to the *Bath*, he began to try the temperate Baths, by the uſe of which growing preſently worſe, and beginning immediately to have a Palſie in his other Members, he had abſtained from them, but that the *Phyſician*, then preſent, promiſing him that he ſhould afterwards be better, exhorted him to perſiſt; wherefore he again enter'd into the Bath, for about thirty days, until at length all his lower members, to wit, from the *Os ſacrum* to his Feet, being wholly looſened, withered away; beſides in his Breaſt was excited a very great difficulty of breathing, and as it were *Aſthmatical*: For that his breaſt was not able to be dilated ſufficiently, by introducing the breath deeply, the Muſcles dedicated to reſpiration being as it ſeems alſo affected with the *Palſie*; wherefore growing ſhort-winded, he laboured with a continual endeavour of thoſe parts, and with an agitation of the whole *Thorax*. In this condition leaving the *Bath*, he was bid by his *Phyſician*, to abſtain for a whole month from any Remedies taken

from

from Medicine; which when he had ſtrictly obſerved, out of hope to grow well again, that time being elapſed, it was then too late to deliberate on the uſe of any Medicines; for beſides his *Paralytick* and withered members, his belly ſwell'd, his breathing was yet more hard and troubleſome, that he could now ſcarely draw breath: His Pulſe was very weak, and upon any motion of his Body, he had frequent ſwoonings away, and loſs of Spirits: Hence, as there was ſcarce any place left for purging, Cordials and Antiparalytick Remedies were only to be inſiſted on, but notwithſtanding the uſe of which, this ſick man, within a fortnights time, labouring for many hours under a *Dyſpnoe* or want of breath, at length expired. The immediate cauſe of whoſe Death I ſuſpect to have been the manifold concretions of the blood in the Heart; for when the motion of the *Præcordia* for a long time was very much hindred, there ſeems nothing more probable, than that theſe kind of gobbets as it were fleſhy, ſhould increaſe within the Ventricles of the Heart.

For the illuſtrating of the *Theory* of the *Palſie*, a little more, and alſo of the *Lethargy* and *Carus*, I ſhall add this other example, with *Anatomical* obſervations; which happened whilſt the former were in the Preſs.

An Example of the Palſie from a Lethargy.

A little one a little above three years old, of a moiſt or humid Brain, as appeared by moſt grievous ſore Eyes, and the watry whelks or puſtles of the face, to which it was ſometimes obnoxious; falling ill about the beginning of *Autumn*, with a ſlow Feavour, and loſt Appetite, it became very torpid and ſleepy, ſo that it would ſleep almoſt continually day and night; but being awake, he knew thoſe ſtanding about him, and anſwered very aptly to their Queſtions. To this Child, fit Remedies being preſently and diligently given, *viz.* Clyſters, Bliſtering Plaſters, Purges, alſo Juleps, Spirits of Harts-horn, Powders, with many others uſed in theſe caſes, they prevailed ſo much, that within ſix or ſeven days the ſick Child being free from its Feavour, waking enough, and deſiring Food, ſeemed to grow well, and to have ſcarce any more need of a *Phyſician*: But in a ſhort time after (by what occaſion uncertain) falling into a relapſe, and again ſleepy, was preſently ſeiſed with a moſt grievous ſtupefaction, ſo that it was hardly to be awakened, and ſcarce knew any one, or what it did it ſelf; the next day being plainly ſtupid, though being ſtrongly pulled, it did open its Eyes, it would roll them about hither and thither, and ſaw nothing; but within a day or two, a *Palſie* follow'd in its whole right ſide. The former Remedies were repeated, and beſides ſneezing Medicines, chawing Medicines to draw down Rheum by the mouth, a taking away of Blood, with Poultiſſes applied to the Feet, and all its Head being ſhaven, drawing Plaſters were put all over its Head, with other Medicines, and ways of adminiſtrations preſcribed in order, nothing profited, but that this ſick Child, after its lying ſo inſenſible for four or five days, at length its breath and Pulſe failing, dyed.

Its dead Body being opened, we found almoſt all things ſound enough in the lower and middle bellies, (*i. e.* in the Belly and Breaſt) unleſs that in the right Kidney, a whitiſh mattery Humor, or as it were a thin Corruption, had begun to be heaped together, which plentifully flowed forth out of ſome parts of the Kidney being diſſected and ſqueezed together: This did ſeem to have been the beginning, or a certain rudiment of a future Impoſthum, and perhaps by reaſon of the Serum not ſufficiently ſeparated here, its greater plenty had flowed to the Brain.

For the top of the Skull being taken away, the anterior region of the Head, almoſt to the inſertion of the fourth boſom, ſwelled up, being covered with clear water, ſhining thorow the Membranes, which preſently flowed forth, when the *Meninges* were diſſected: Further, in this place, portions of the Brain being by pieces cut off, appeared too wet, and without any red or bloody pricks: but in the hinder border of the Brain the Veſſels were red with blood, and the *Cortical* ſubſtance appeared without tumor, or deluge of water, more cloſe and firm: From theſe (as we have affirmed before) it manifeſtly appeared, that the cauſe of the *Lethargy* did depend upon the watry flood, or as it were *Anaſarca* or Dropſie of the outward part of the Brain.

The Brain being cut piece-meal, and an hole made in the anterior cavity, diſtended by the water, the clear water being before as it were penned up, within a more narrow ſpace, leaped forth, a great plenty of which had filled all the Ventricles to the top, and (as it ſeems) by compreſſing the *Optick* chambers, (as in the other caſe above deſcribed) brought in blindneſs, and by entring or preſſing together one of the Streaked Bodies, or its Pores, cauſed the *Palſie*.

The *Choroeidal* Infoldings appeared as it were half boiled, whitiſh, and almoſt without blood. It is probable, that the water did flow forth of theſe Veſſels, by which the Ventricles of the Brain were overflown, all, or at leaſt the greateſt part

of it; although in this caſe, if (as ſome think) the watry *Latex* or Humor ſliding down lower from the ſhelly part of the Brain, the Brain being at length thorowly paſſed thorow, did rain down into theſe boſoms, we may from thence aptly fetch a reaſon, wherefore the *Lethargy* at firſt thought to be cured, returned afterwards more cruel, accompanied with blindneſs and the *Palſie*; to wit, becauſe at firſt the ſtock of the ſleepy matter falling down, from the ſhelly part of the Brain, into its cavity, the animal function was a little cleared; but afterwards, when new matter ſprung up in the *Cortex* of the Brain, and this ſliding forward into its boſom, was heaped up to a fulneſs, for that reaſon happened the relapſe of the former Diſeaſe, with thoſe companions of blindneſs and the *Palſie*.

But although the Dropſie of the interior Brain, or the inundation of its Ventricles, by compreſſing either the Streaked Bodies, or the *optick* chambers, raiſed up the *Palſie* or blindneſs, or by pulling the beginnings of the Nerves, the Convulſive Diſtempers; yet it appears moſt evidently by our late *Anatomical* obſervation, that the *Lethargy* did not ariſe from any ſuch cauſe, but only from the exterior part of the Brain being overflowed, or preſſed together.

A certain Gentleman a long time unhealthy, after he had laboured almoſt for five months with the *Colick*, or rather with a wandring *Scorbutical* Gout, in which not only the Viſcera and Loins were troubled with great torments; but moreover the Membranes and Muſcles of the whole Body, were almoſt continually tormented; and at length he ſuffered ſometimes moſt horrid Convulſions in his Members, ſometimes reſolutions, and ſometimes a Phrenſie in his Head, and ſometimes as it were *Apoplectical* fits, or a darkneſs in his Eyes, ſo that being worn out, his ſtrength and ſpirits wholly exhauſted, he dyed. Almoſt ſeven days (except the laſt but one) before he dyed, being more ſtrong as to his Senſe and Intellect, he lived almoſt perpetually without ſleep; though gentle or the more ſtrong *Opiates* were given him, yet he could not ſleep at all. A little before this waking, from a *Veſicatory* applied to the hinder part of his Neck, an immenſe quantity of water flowed; and from that time even till he dyed, it ſtill flowed forth; hence, as I ſuſpect, he became ſo waking by reaſon of the watry humor being ſo greatly drawn away from the Brain.

The head of this dead Man being opened, the interior cavities of the Brain, or all the Ventricles being filled to the top with clear water, appeared as if they were diſtended; yea the medullary cord it ſelf, about the top of the Back-bone, ſeemed to be drowned and compaſſed about with water laid up there. Without doubt, for this reaſon, the Pains and Convulſions ſo cruelly tormented him in his Loins, Members, and all over his Body; and by reaſon of the deluge in the Ventricles, he became obnoxious to blindneſs of his ſight, and to frequent looſenings of his limbs: Nevertheleſs, hence no *Lethargy*, but a waking was induced, by reaſon of the waters being ſo much derived from the compaſs of the Brain by the Bliſtering Plaſters. He had alſo a Dropſie in his Breaſt, by reaſon of his Lungs being much vitiated. His Liver appeared of a mighty bulk, beſprinkled every where with white ſpots, and almoſt without blood: ſo that to theſe faults of the *Viſcera*, the vices of the Blood and nervous juice ought in ſome meaſure to be aſcribed.

CHAP.

CHAP. X.

Of the Delirium and Phrenſie.

THUS much concerning *Cephalick* Diſeaſes, by which the Animal Functions by themſelves, and as they are Corporeal, without any reſpect to the Animal Soul, are wont to be hindred or perverted: In ſome of which, *viz.* the *Vertigo* and *Palſie*, the Intellect for the moſt part remains clear and lively, and in the reſt, like the eye placed in an obſcure place, it beholds the ſpecies, either not at all, or a few objects only of a more rude appearance, but is not eaſily ſnatched into any great error or fury; which kind of *ſymptoms* are ordinarily induced by reaſon of other Diſtempers of the Head, and of the Spirits inhabiting it, of which we are now about to treat. For if at any time the Imagination is ſo diſturbed, or perverted, that it falſly conceives, or evilly compoſes or divides, the ſpecies and notions brought from the Senſe or Memory; preſently for that reaſon the intellect beholds or forms conceptions and thoughts only deformed, diſtracted one from another, and very confuſed: Which indeed are repreſented to it from the Brain evilly affected, and as it were monſters from a multiplying or diſtorted Glaſs. As there are many ways, by which the Imagination, and by conſequence the mind and will, and the other powers of the ſuperior ſoul, are wont to be perverted or depraved, all of them are noted by the common word Fooliſhneſs, or talking idly. But this Diſtemper is diſtinguiſhed into ſhorter, which is called a *Delirium*; and into a longer or continual; which is either conjoined with a Feavour, and termed *Phrenſie*; or it happens without a Feavour, and then their is joyned with it, either raving, ſadneſs, or ſtupidity, and ſo it is divided into madneſs, melancholy, and moroſity or fooliſhneſs: we ſhall ſpeak of each of theſe in order; and firſt of the *Delirium* and *Phrenſie*.

The Diſtempers of the Brain follow, in which Reaſon is hurt as well as the other Animal Functions.

who are ſaid to be Fooliſh, or to talk idly.

This is either ſhorter, as the Delirium; or longer, and with a Feavour, & called Phrenſie; or without a Feavour, as melancholy, madneſs, ſtupidity.

Although the *Delirium* is not a Diſeaſe of it ſelf, but only a *ſymptom* proceeding from other Diſtempers, yet becauſe it happens in ſome of them, that for the moſt part it is cured by Remedies appropriate to it, therefore it will not be amiſs for us to inquire a little more ſtrictly into the cauſes and nature of it. This word taken after an eſpecial manner, is the ſame with παραφροσύνη, or a going crooked, or out of the right or ſtraight way, and denotes an hurt of the ſame Animal Function ſuch as ariſeth in fits of the Feavour, Drunkenneſs, and ſometimes in the paſſions called *Hyſterical*, and induces men for a ſhort time to think, ſpeak, or do abſurd things, either ſome of theſe, or all of them together.

What the Delirium is.

The *Delirium* is excited, foraſmuch as the Animal Spirits being either too much irritated, or acted into confuſion, are carried tumultuouſly into diſorders hither and thither, within the globous compaſs of the Brain, where the *Phantaſie* and *Memory* have their ſeats; and ſo whilſt the various images of the imagination and the memory being excited at once, are confounded together, they object only incongruous and abſurd *phantaſies* to the rational Soul, and ſo both the acts of the intellect and the will, are only inordinately choſen or drawn forth. In like manner it happens, by reaſon that the Animal Spirits being moved, within the middle of the Brain or the *Callous* Body, that incongruous conceptions, and confuſed thoughts, are objected to the rational Soul; as in a long circumgyration or turning about of the body, the images of viſible things are carried to the common ſenſe, whence all things ſeem to be turned about, and ſometimes to be lifted up, and ſometimes to be depreſſed to the ground; that nothing is beheld ſtable or ſtanding in its due place, and poſition. In a Brain rightly diſpoſed, the motion of the Animal Spirits are performed, as it were in certain numbers, ways and meaſures; whilſt ſome Spirits are raiſed up in theſe tracts, others lye ſtill in thoſe, and ſo they ſucceed one another in their motions; and the ſeveral acts of every faculty are made diſtinct, like ſo many wavings of water in a River; but in the *Delirium*, all the Spirits leap forth at once, and meeting one another tumultuouſly, or variouſly laying hold on one another, are agitated like mad *Bacchanals*. Further, even as theſe being ſtruck with ſuch a fury within the compaſs of the Brain, do ſtir up manifold and very much diſturbed cogitations; ſo whilſt they are carried without its confines into the nervous original, they produce incongruous ſpeeches, abſurd geſtures of the body, and members, and not rarely Convulſive motions. But for that ſuch a rage of the ſpirits, (otherways than in the *Phrenſie* or *Madneſs*) preſently grows cool, and their tumult being over, none of their wandring tracts are imprinted in the Brain, the *Delirium* ſoon paſſes

Its formal Reaſon.

over, and the diſtemper'd come immediately to themſelves again, without any marks left of their fooliſhneſs or idle raving.

If it be demanded, from whence this ſhort fury is impreſſed on the ſpirits, inhabiting the Brain, that the Reins of the mind being ſhaken off, they turn thus all things upſide down in their government; we ſay, that they conceive this kind of inordination, from a twofold reaſon, to wit, this rage or madneſs is brought immediately to them, from the blood waſhing the frame of the Brain; or ſome Animal Spirits, outwardly dwelling in the nervous Stock, enter firſt of all into ſome diſorder; then the ſame being communicated by the nervous paſſages, affecting in like manner the ſpirits there inhabiting, ſtirs them into a *Delirium*. There are various cauſes and kinds of either of theſe: the chief of which we ſhall here touch upon; and firſt ſhall be ſhewed, how, and for what occaſions, the Blood, being either ſwelled up with too much heat, or being pregnant with an invenomed matter, is the parent of the *Delirium*; foraſmuch as it inſinuates into the Pores and paſſages of the Brain, either fierce and untameable particles, or ſuch as are malignant and deadly to the Animal regiment.

The Cauſes of the Delirium.

1. Either from the Blood: Or

2. From exterior Spirits planted in the nervous Stock.

By what, and how many ways the Delirium is cauſed by the Blood:

1. By reaſon of its too great heat.

First, As to the firſt, in the fits of intermitting and in the height of continual Feavours, the blood growing hot, by an immoderate burning, ſometimes ſtirs up the *Delirium*, by the mere force of its Ebullition or boiling up; to wit, for that it ſwelling up very much, whilſt it paſſes thorow the ſmall ſhoots of the Arteries, every where diffuſed thorow the outward compaſs of the Brain, it very much blows them up and diſtends them; and ſo preſſing together the ſubſtance of the Brain, variouſly drives in the Spirits, and as it were compells them into very confuſed troops: Moreover, from the blood ſo ſwelling up, with a frothy rarefaction, the Effluvia's of heat, and with them heterogeneous particles, entring into the Pores and paſſages of the Brain, agitate the Spirits, and tumultuouſly ſnatch them hither and thither.

2. By reaſon of untameable Particles carried from it into the Brain.

Secondly, Almoſt for the like reaſon Drunkenneſs, a deep Sleep, or a *Delirium*, is brought in; to wit, foraſmuch as the bloody maſs doth inſinuate the ſpirituous particles of the Wine, (by which it grows hot) into the Pores and paſſages of the Brain, by which the Spirits dwelling in them, are either plainly overturned, or are moved into inordinate and confuſed motions. For that the untameable little Bodies of Wine or Beer plentifully drunk, open the ſhut places of any Brain, how ſound and firm ſoever it be, and penetrating deeply into the Marrowy paſſages, diſturb and plainly overturn the Acts both of reaſon and of the imagination.

3. By reaſon of malignant Particles ſuffuſed from it.

Thirdly, The blood ſuggeſting not only feavouriſh and turgid, or vinous and untameable particles, but ſometimes malignant, and as it were venomous to the Animal regiment, ſtirs up a *Delirium*, either with or without a Feavour. As to the former, in the Plague, Small Pox, malignant Feavours (although the heat be but moderate) the malignant matter being tranſlated to the Brain, becauſe it diſſipates a great company of Spirits (rather than that it drives them into tumults) brings forth abrupt, incoherent, and at length diſtracted notions.

4. By reaſon of Effluvias, or venomous Particles, obtruded alſo on the Brain.

For the like reaſon alſo, ſome intoxicating and venomous things taken inwardly, and (as ſome affirm) outwardly applied, quickly cauſe a *Delirium*. This is commonly reported of the furious night-ſhade, *Mandrakes*, and ſome other plants; as for the roots of wild Parſnips, the thing is very well known. A certain intimate friend of mine told me, and he was a Man that might be credited, and alſo very learned, That he entring into the Houſe of a certain Gentleman, found the Miſtreſs of the Family, her Daughters, and all her Maids (excepting one) become all at once Delirious, and ſpeaking abſurd and incongruous ſpeeches, run up and down and leaped about the Houſe; and for that he plainly thought them all mad, he learnt of the ſober Maid, who had her reaſon, and was her ſelf, that all that had happened from their eating of Parſnips, which ſhe had not taſted: Which indeed the event ſhewed to be true; for after they had tired themſelves, and fallen to ſleep, they all at length awakned ſober. We have not here leaſure to examine, whether this or other kinds of intoxicating things, infeſtous rather to the animal government, than the vital, do communicate to the Brain their evil, by the paſſage only of the Blood, or alſo in ſome meaſure, by a contact of the ſpirits reſiding in the Ventricle.

5. By reaſon of its afflux being denied to the Brain.

But moreover, we advertiſe you, that ſometimes a *Delirium* is excited from a want, and great diſſipation of the Animal Spirits; becauſe their ſeries or orders being broken off, and drawn one from another, like as if they were tumultuarily heaped together, cauſe confuſed and incongruous notions. Hence it is obſerved, that ſome have become Delirious by great *Hæmorrhagies*, or long watchings, and exceſſive want of food; for this reaſon, many are wont to die delirious, and talking idly.

There

There remains the other kind of *Delirium*, in which the Blood being faultleſs, the Animal Spirits flowing ſome where in the nervous ſtock, firſt enter into diſorder; then the ſame affection creeping thorow the nervous paſſages to the Brain, ſtirs up the Spirits inhabiting its middle part into a *Delirium*. This is ſufficiently obvious in the paſſions that are called *Hyſterical*; to wit, after a ſwelling up of the Belly, and an oppreſſion of the Heart, doth ſucceed ſometimes a lying ſpeechleſs, ſometimes a talking idly, with weeping and laughing. In like manner I have obſerved in a moſt cruel *Colick*, that ſometimes after great torments about the Bowels and the Loins, they have fallen into a *Delirium*, then a little after this ceaſing, the torments have returned. I knew a young Maid (as we have ſomewhere elſe mentioned) from the taking of an *Emetick* Potion, whilſt it worked, was wont conſtantly to fall into a *Delirium*. I have alſo often noted, that a *Gangrene* beginning in ſome external member, has cauſed a *Delirium*. And this in a Wound or Ulcer, is ordinarily noted for a mortal ſign, becauſe it denotes the Animal Spirits in the diſtemper'd part to be ſlain. *How a Delirium proceeds from the irregularities of the exterior Spirits.*

Nor doth this *ſymptom* coming upon thoſe who are long ſick and almoſt worn out, give any better *prognoſtick*; in the fits of intermitting Feavours, it is almoſt ever ſafe; but in continual Feavours dubious, and of ſomething a ſuſpected event; in malignant it more often fore-ſpeaks evil; in Convulſive Diſeaſes, the firſt aſſaults of a *Delirium* for the moſt part are free from danger, but yet its frequent coming, frequently turns that diſpoſition into a *Carus*, *Apoplexy*, or *Palſie*. *The Prognoſtick of a Delirium.*

This Diſtemper, as often as it is ſeen to be ſafe enough, requires not a Cure; for the fit quickly and eaſily paſſes over: yet, becauſe ſome, who have a looſe and weak Brain, and the Animal Spirits too eaſily diſſipable, and apt to flight and confuſion, being diſturbed by any light occaſion, are wont preſently to grow Delirious and to talk idly; therefore there is need of Medicine for theſe, not only of *Hellebore*, but alſo *Cephalick* Remedies, which may ſtrengthen the Brain, and fortifie it againſt the incurſions of the Morbific matter; alſo which may fortifie the Animal Spirits, and render them more fixt and ſtrong for reſiſting. We have above deſcribed the forms of theſe kind of Medicines, and their manner of adminiſtration, which are profitable for the taking away the foregoing cauſe of any other *Cephalick* Diſeaſe. *Its Cure.*

A *Delirium* coming upon continual and malignant Feavours, requires a peculiar way of healing: for in the firſt place, it ſhews the morbific matter dangerouſly tranſlated towards the Head, and therefore ought to be called back from thence, by any means; for which end may be laid Plaſters that draw bliſters to the hinder part of the Neck, other Plaſters or Puttiſſes, or the fleſh of living Creatures, or their warm bowels to the feet; inwardly may be taken temperate *Cephalicks*, as Powder of Coral and Pearl, black Cherry Water, or Water of Cowſlip Flowers, or Poppy Water, and others ſweetning and cheriſhing the ſpirits.

Theſe being thus premiſed, concerning the firſt and moſt light manner of fooliſhneſs or talking idly, we will proceed to its higher degree, *viz.* the *Phrenſie*, which is far longer, and more durable, than the former Diſtemper. In the *Delirium*, a perturbation of the Spirits, inhabiting of the Brain, being excited, is like a waving of waters, from a ſtone flung into a River; but in a *Phrenſie*, their commotion ſeems as it were the ſtorm of waters, raging in a tempeſt.

The *Phrenſie* is defined, to be a continual dotage, or deprivation of the principal faculties of the Brain, ariſing from an Inflammation of the *Meninges*, with a continual Feavour. To this Diſeaſe there is another of kin, *viz.* the *Paraphrenſie*, commonly called, or additional *Phrenſie*, whoſe cauſe is not an inflammation of the Membranes which cover the Head, but as they affirm of the *Diaphragma*. Further, in either Diſtemper (as alſo in the *Pleuriſie* but falſly) it is affirmed, that the Feavour doth ariſe as it were only ſymptomatical, from the ſame conjunct cauſe, *viz.* from the Inflammation of ſome part. But indeed, that the *Phrenſie* doth rather ſucceed the *Feavour*, and is produced, becauſe the boiling blood doth tranſfer its aduſt & burnt recrements to the Head; *Hippocrates* long ſince, and now every common body, obſerves: to wit, for that the Urine of one ſick of a Feavour, being changed from a troubled and thick, into a thin and waterish Urine, ſhews a *Phrenſie* at hand: Wherefore, from hence, the cauſe of this Diſtemper is concluded to be a tranſlation of the Feavourish matter into the Brain. *Of the Phrenſie, what it is.* *The Paraphrenſis.*

But as to the conjunct cauſes of the *Phrenſie*, and *Paraphrenſis*, we may eaſily ſhew, that the former doth not always proceed from the Inflammation of the *Meninges*, nor this latter from the Inflammation of the Midriff. I have often ſeen in Anatomical Diſſections, the *Meninges*, yea ſometimes alſo the exterior compaſs of the Brain, *Their Conjunct Cauſes.*

Brain, beſet with an inflamed tumor, and the ſick not diſtemper'd with a *Phrenſie*, but on the contrary with a ſtupidity, and have dyed with a *Carus*, or ſome other ſleepy Diſeaſes. And truly, that it is ſo, reaſon plainly declares; for the *Meninges* being inflamed, and by that made more tumid, preſs together the Brain very much, and about its compaſs ſhut up the ways and paſſages of the Spirits; ſo that the functions of waking and memory being hindred, the *Lethargy* (as it appears *de facto*) neceſſarily follows: Notwithſtanding, far otherways in the *Phrenſie*, all the paſſages and Pores of the Brain, for the excurſions of the Spirits, ſeem to be too largely open; becauſe the Images hidden or laid up, are raiſed all at once, out of the utmoſt, and all the places of the memory, which together with others, ſuggeſted from the Phantaſie to the common ſenſory, tumultuouſly, bring forth ſuch manifold and highly confuſed notions. There is only wanting to the ſenſitive ſoul, for its expanſion to be ſtraitned or looſened, within the Head (which certainly the inflammation of the *Meninges* would effect) rather than that it ſhould be dilated above meaſure, and that all the Pores of the Brain ſhould be unlocked and carried beyond its wonted compaſs. Perhaps it may happen, from a long continuance of this Diſeaſe, that the Blood being greatly heaped up within the Veſſels of the *Meninges*, and there ſtagnating, that it may at length bring forth an Inflammation in them; and then for that reaſon, we may ſuſpect, (becauſe it often ſo falls out) that the *Phrenſie* doth paſs into the *Carus*, or *Lethargy*, of which *phrenſical* perſons often dye.

The Phrenſie not from the Inflammation of the Meninges.

No leſs do we reject the Inflammation of the *Diaphragma*, which cauſe of the *Paraphreneſis*, *Galen* in times paſt, and moved by his authority, moſt *Phyſicians* in every age ſince, aſſerted: *Anatomical* obſervations plainly prove the contrary. Some time ſince, diſſecting the dead Carcaſe of a Maid, dying of a ſudden *Leipothymy* or ſwooning away, we found in the fleſhy part of the *Diaphragma* a great Impoſthume, with a bag full of filthy matter, and watery little bladders; yet ſhe was not troubled ever with a *Delirium* or *Phrenſie*. Some time ſince alſo when we had made an *Anatomical* Inſpection of a Gentleman of the Univerſity, (of whom we have made mention in a late Tract) who dyed of a long ſpurious *Pleuriſie*, it manifeſtly appeared, that a great Impoſthume being ripened in the *Pleura*, and the intercoſtal Muſcles, and broke inwardly, that a vaſt plenty of matter had flowed forth into the cavity of the *Thorax*, which gnawing the *Diaphragma* lying under, had made a great hole in it; nor was this man however in all his ſickneſs *Delirious*, or Frantick. Wherefore, I think this Diſtemper ſcarce ever to be produced from ſuch a cauſe: but that opinion ſeems to ariſe from hence, becauſe oftentimes in a true *Phrenſie*, together with a continual raving, the motion of the *Diaphragma* is wont to be hindred or perverted; as is gathered from the unequal and difficult breathing, to wit, ſometimes anhelous or breathing ſhort, and as it were ſuſpended, ſometimes ſhort and ſwiftly repeated, with ſometimes a double breathing; which kind of *ſymptoms*, and alſo at the ſame time the alienation of the mind, are ſaid to proceed from the Midriff being inflamed, and for that reaſon convulſed; wherefore the Ancients called the Diphragma *Phrenes*: But there was no need for this, if they had conſider'd, that the whole action of the *Diaphragma*, doth depend upon the flowing forth of the Animal Spirits from the *Cerebel*, and therefore there is a neceſſity, if the *Phrenetick* matter invading the Brain, ſome part of it ſhould with it ruſh into the *Cerebel*, that beſides the raving, the motion alſo of the Midriff, though of it ſelf innocent, ſhould be altered; as we have ſhewed elſewhere more largely.

The Paraphreneſis not from the Inflammation of the Diaphragma.

Wherefore breathing is hurt in this Diſeaſe.

Therefore the formal reaſon of the *Phrenſie* ſeems to conſiſt in this, that the Animal Spirits being at firſt very much irritated in the whole Brain, are driven into inordinate, very confuſed, and alſo impetuous motions; ſo that the acts of every Animal Function are depraved, and variouſly perverted; and at the ſame time, very many Ideas of things being raiſed up out of the memory, the old are confounded with the new, and ſome evilly joined, or wonderfully divided, are confounded with others, the imagination ſuggeſts manifold *Phantaſms*, and almoſt innumerable, and all of them only incongruous; and the common ſenſory repreſents the images of ſenſible things diſtorted, double, or incoherent; that hence the mind and the will, chooſe or pick out nothing but ridiculous and impertinent conceptions and paſſions; and cauſe the actions of the body to become almoſt only irregular. Moreover, the ſpirits being ſtruck as it were with madneſs, tumultuate not only in the Brain, but alſo in the *Cerebel*, and every where in the nervous Stock; wherefore, *Frantick* people not only talk idly, but breath unequally, ſpeak aloud, ſtrike with their fiſts, fling about their hands and feet, yea and ſtretch forth all their members with a mighty ſtrength, and a moſt ſtrong force, that indeed the whole Soul ſeems to grow hot and furious in the whole body, to be mad, or rather as it were to be

The formal Reaſon of the Phrenſie.

inflamed

inflamed with a ſudden burning. And truly a *Phrenſie* cannot be more aptly defined, than that it is a burning or inflammation of the whole ſenſitive ſoul, or animal ſpirits, as to their whole *Hypoſtaſis* or Conſtitution. This burning always beginning from the ſpirits inhabiting the Brain, and wandring from thence into the other parts of the ſenſitive ſoul, ſeems to receive from the Blood, firſt growing hot and raging with a Feavouriſh fire, both the firſt incentive matter, and then the conſtant food of the burning. For indeed it is probable, that the blood burning Feavouriſhly, doth pour forth on the Brain ſometimes ſulphureous Particles, together with the ſpirituous, which being half inflamed, and after a ſort burning forth, penetrate together with the others, and from thence immediately entring into all the marrowy and nervous paſſages, adhere every where to the ſpirits, and ſo render them being inflamed, highly rageing and implacable. Certainly it is more likely, that the *Phrenſie* is rather excited after this manner, by an inflammation of the Spirits, than from that of the *Meninges* or of the Brain, which more ſurely cauſes an Headach or *Lethargy*, than a Fury, as we have frequently found by *Anatomy*.

This Diſeaſe proceeds from the burning of the Animal Spirits.

The Inflammation of the Meninges ſtirs up rather the inveterate Headach, or the Lethargy, than the Phrenſie.

And indeed, that it is ſo, is not only ours, or any new opinion, but that great follower and beſt interpreter of *Hippocrates*, *Proſper Martianus*, who hath affirmed the ſame thing, almoſt in expreſs words, *viz.* Comment on his Book *De Morbis* 3. *verſ.* 99. *pag.* 151. he ſays, "That *Hippocrates* doth call the *Phrenſie* a *Delirium* with a Feavour, "which is continual, and depends upon a firm and ſtable Diſtemper: to wit, from "an inflammation of thoſe parts, which ſerve to inſtitute Nature, Reaſon, and the "Mind; For ſo the Animal Spirits, whoſe viciouſneſs cauſe the *Delirium*, do not "grow hot as it were by a ſimple quality, but are altered as to their ſubſtance. This Man manifeſtly diſtinguiſhes between heat and flame, and affirming that to be in reſpect of quality, and this an alteration in reſpect of ſubſtance, plainly aſcribes the cauſe of the *Phrenſie* to the inflammation of the Spirits. He has in the ſame place more things appoſite to our matter, to wit, that the containing cauſe of the *Phrenſie* was not the inflammation of the *Meninges*, but of the Spirits, whoſe ſubſtance is indeed altered, that is, foraſmuch as it is become fiery, ſuch a continual *Delirium* is excited.

Proſper Martianus alſo aſſerts this.

I have oftentimes compared the production of the Spirits from the Blood into the Brain, to a Chymical Diſtillation; of which it is obſerved, if the ſpirituous ſulphureous liquor be provoked with too ſtrong a fire, that in Diſtilling it ſometimes takes fire, and aſcends in the *Alembick* with a very great flame. This is known of Oyl of *Turpentine*, of it ſelf, or with the Flowers of *Sulphur*, to the great loſs of ſome. In like manner we may believe, that the blood growing more ſtrongly hot, doth often communicate alſo a burning to the Spirits diſtilled out of it, *viz.* that ſome half burnt Particles, do inſinuate themſelves into the Pores of the Brain, which ruſhing into all the paſſages of the Spirits, both there and in its appendix, every where inkindle the Spirits, and compel them into moſt ſwift motions, almoſt like Lightning.

Chymical Spirits in their diſtilling are ſometimes inflamed.

So the Animal Spirits.

But becauſe the *Phrenſie* doth not come upon all Feavours, but only on thoſe highly burning, the reaſon is plain by what follows; to wit, the cloſure of the Brain ought to be ſo ſhut up, that not only any extraneous thing might not be poured into them, but that the more intenſe flame of the Blood, however burning it be, and though planted round about, might not be able to break thorow; wherefore, ſome diſtemper'd with a burning Feavour, although the Blood grows hot thorow the whole, the Bowels burn, the Marrow rages, the Tongue and Jaws roſted like a coal, yet the Brain being ſtill firmly ſhut up, all the Animal Functions remain whole and ſound. But on the contrary, others who have a weak and too looſe a Brain, and their Blood more ſulphureous than it ought, become *Phrenſical* not only from a burning Feavour, but ſometimes from a more gentle viſit. By reaſon of what foregoing cauſe, and for what occaſions, or evident cauſes, this is wont to happen, is the next thing we ſhall inquire into.

What the Indiſpoſition of the Brain is to the Phrenſy.

Hitherto hath been ſhown that the immediate ſubject of the *Phrenſie* is the ſenſitive Soul, or the *Hypoſtaſis* of the Animal Spirits, and that the formal reaſon of the Diſeaſe doth conſiſt in their Inflammation, and that the conjunct cauſe is the ſulphureous particles poured forth from the Blood into the incloſures of the Brain, and there continually inkindling the Spirits; and now it is no difficult matter to aſſign its *procatartick* or foregoing cauſes, which we find partly in the Blood, and partly in the Brain and its inhabitants.

The Procatartick Cauſes of the Phrenſy,

which are partly in the Blood, and

The previous diſpoſition of the Blood, diſpoſing to the *Phrenſie*, is ſometimes ſimple, ſometimes twofold; the former is an hot, ſharp, or bilous conſtitution of it, to wit, that contains very many ſulphureous Particles in it ſelf, which are apt to inflame

the

the Blood in a Feavour more than ought to be, and to inſinuate its burning into the Brain. This diſpoſition, when it is very potent and active, often produces this Diſeaſe of it ſelf; but for the moſt part, there is another diſpoſition of the Blood, which helps that former, and renders it more efficacious, to wit, that, beſides the ſulphureous and inflameable Particles, there are others ſharp and penetrative, which enter into the Pores, and open them, ſo that the former more eaſily enter in, or are introduced: This the ſaline little Bodies, conjoined with the ſulphureous, do in a manner effect; hence Cholerick and Melancholick perſons growing Feavouriſh, are more prone to become furious; but much more do the *Heterogeneous* Particles, implanted in the Blood, and moved by a Feavour, open the doors of the Brain, and intromit all that are inflameable: wherefore a *Phrenſie* frequently comes upon the Small-Pox, and malignant, and Peſtilential Feavours.

Partly in the Brain. The other proviſion to a *Phrenſie*, which is of the Brain, conſiſts partly in its temper and conformation, and partly in the diſpoſition of the Spirits inhabiting it: As to the former, thoſe indued with an hot and dry Brain, are found to be moſt prone to a *Phrenſie*; not becauſe that conſtitution is more obnoxious to an inflammation or burning, (for to this it is leſs apt) but becauſe in ſuch a Brain, otherwiſe than in an hot and moiſt, or cold and dry, the Pores and paſſages are more open, and too much gaping, and ſo give an entrance to the incentive matter, ſuggeſted from the Feavour: which beſides, they much more eaſily admit, if the Spirits being very fugacious or apt to flight, or *pathetick*, or paſſionate, are upon every light occaſion ready to fall into paſſions of ſadneſs, fear, anger, or hatred; ſo that they reſiſt not the incurſions of the extraneous matter, and more readily conceive a burning themſelves.

The evident cauſes of the Phrenſie. The evident cauſes of the *Phrenſie* are either more remote, *viz.* whatever things are wont to excite a Feavouriſh intemperance; as Surfeits. Drunkenneſs, a very vehement diſturbance of either body or mind, uſual evacuations being ſuppreſſed, with many others; or more near, as a Feavour, and its dependences and adjuncts; to wit, if it be peſtilential, malignant, or after an evil manner; if it ariſes by reaſon of a Surfeit taken from very incongruous Meats or Drink, or if it ſucceeds violent paſſions, as of Love, hatred, envie, indignation, or ſadneſs; or immoderate ſtudies: for theſe kind of occaſions render the Blood and Animal Spirits, growing Feavouriſhly hot, very propenſe to the frantick Diſtemper.

The differences of it. Since that this Diſeaſe depends rather and more immediately upon the Soul than upon the Humors or ſolid parts being diſtemper'd, its kinds and differences are neither various nor manifold: In reſpect of magnitude, the *Phrenſie* is either great or moderate, alſo continual or intermitting; to wit, according as the Animal Spirits are more or leſs inflamed, and as they receive the food of their burning continually from the Blood, or by turns. Secondly, As the burning begins only in the Brain, or together with it in the Cerebel, it is commonly diſtinguiſhed into the *Phrenſie*, or the *Paraphreneſis*; which is as much as to ſay, that either the ſpontaneous Animal Functions are only or chiefly hurt, or elſe together with them the vital alſo. But this Diſeaſe as to the Feavour, on which it depends, hath its nature and manner malignant, or free from malignity; alſo according to the temper of the ſick, the *Phrenſie* is diſtinguiſhed into Sanguineous, Cholerick, Phlegmatick, or Melancholick; and this not improperly, for the Animal Spirits are wont to grow hot and burning, after a diverſe manner, in this Diſeaſe, according to their various diſpoſitions.

The Prognoſtick. The *Prognoſtick* in this Diſeaſe is always doubtful, and the event is to be inſtituted with an evil ſuſpicion: For the Phrenſie of it ſelf (as *Trallianus* ſays) *is a moſt acute and moſt dangerous Diſeaſe*; then, if it comes upon a Peſtilential, or malignant Feavour, or of ſome other evil kind, we cannot but expect the end of it to be mortal.

If a *Phrenſie* happens in a ſound body, well habited, of a Sanguine temperament, and young, there is greater hopes of health, than if it were ſickly, aged, lean, or Cholerick, and obnoxious to violent Paſſions.

If the *Phrenſie* remitting by frequent turns, have lucid intervals, it is better than if the fury ſhould be undiſcontinued: But if the ſick ſometimes ſeem to be better, yet after moderate ſleep to awake always furious, it is a ſign that the Diſeaſe is pertinacious, and for that reaſon dangerous; for that a new ſtock of incentive matter is from thence carried to the Brain; which indeed we have elſewhere ſhewn to be made far more plentifully in ſleep than waking.

A *Phrenſie* is in a ſhort time terminated with the Feavour, either in health or death; or elſe it is protracted, and remains after the Feavour; or at length it is healed, or paſſes into other Diſeaſes, to wit, the *Lethargy*, or *Madneſs*, or *Melancholy*.

If the *Feavour* having a laudable *Criſis*, either by Sweat or great quantity of Urine,

is

is fully cured, for the moſt part the *Phrenſie* alſo ceaſes: but if the Feavour be not cured and carries ſtill the Morbific matter to the Head, ſo that beſides the Animal Functions being depraved, the vital begin to fail (which appears by the Pulſe and breathing being altered for the worſe) if the Urine be pale, if that frequent bleeding at the Noſe, if Vomiting, and Convulſion happen, the *Phyſician* concludes death to be at hand.

Sometimes a *Feavour*, though it be not at once or fully Cured, yet paſſing away afterwards ſlowly and by degrees, leaves a *Phrenſie*, or a talking idly behind it; which, if it doth not by its ſtay obliterate the former tracts of the Spirits in the Brain, either will end by little and little of its own accord, or is to be healed by the help of Remedies.

If that by reaſon of the *Phrenſie* being long protracted, the *Meninges*, or the *Cortex* of the Brain, be poſſeſſed from the Blood, or *Serum*, there heaped up, and ſtagnating; with an inflamed tumor, or a ſerous deluge, the *Lethargy*, or ſleepy Diſeaſes follow; the Cure of which is often very difficult, or not at all. But if from a long *Phrenſie*, either the Animal Spirits (though their burning ſhould ceaſe) contract a vicious nature, or that the paſſages and Pores of the Brain are perverted, a perpetual raving oftentimes ſucceeds, the former Diſeaſe paſſing into Madneſs, or Melancholy, or fooliſhneſs or ſtupidity. Wherefore it is vulgarly ſaid of thoſe that are *Frantick*, and not ſoon Cured, that their Brains are crack'd or broken, ſo that after that, they are always Mad or raving.

The Cure of the Phrenſie.

In the Cure of the *Phrenſie*, we ought to reſpect at once the Feavour and the Fury. The Feavouriſh burning of the Blood, or its immoderate growing hot (which for the moſt part is the antecedent cauſe of the other effect) ought in the firſt place to be appeaſed and allayed, and the Animal Spirits to be cheriſhed, and freed from any great burning. If the *Phrenſie* happens about the beginning of the Feavour, or the middle of it, the ſame Remedies in a manner, and the ſame method of curing conduce to either end: But if this Diſtemper comes upon this, whilſt it is at a ſtand, or at its height, the means of Curing are oftentimes repugnant to either, and there is need of great caution, leſt whilſt we endeavour to help one Diſeaſe, we do not increaſe the other; in this caſe, the vital indication concerning the preſerving of ſtrength, obtains the firſt place; and the taking away of blood, or purging, is not to be raſhly and copiouſly celebrated.

Phlebotomy.

In the former caſe, when the Feavour and the *Phrenſie* are almoſt both of an age, *Phlebotomy* rarely or never is to be omitted, but is preſently to be performed, and if ſtrength will bear it, let it be afterwards repeated. For nothing depreſſes and diminiſhes the immoderate flame of the blood, like to this Remedy, and nothing more averts or recals its burning from the Animal regiment: Wherefore, if the matter requires it, let a vein be opened, ſometimes in the Arm or Hand, ſometimes in the Leg or Foot, and ſometimes in the Neck or forehead: perhaps ſometimes it may be expedient to open the temporal Artery: yea alſo to take away blood in other places by Leeches, and ſometimes by Cupping-Glaſſes. For this gives the chiefeſt help, and according to *Galen*, is the *moſt powerful and principal Remedy*, and is wont to fulfil very many indications in a *Phrenſie*.

Clyſters.

But for the prevention of the Feavouriſh matter being carried from the Bowels into the Head, Clyſters are of chief uſe; with which, if need be, let the Belly be continually kept ſlippery. Vomiting Medicines, and Purging, unleſs very gentle, have very rarely any place here. *Cataplaſms* of Rue, Chamomel, Vervine, Bryony Roots, red Poppies, with Sope, may be laid all over the Feet; or inſtead of them, may be applied Pigeons or Chickens, cut up and laid warm: In the mean time, as you ſee occaſion, there ought to be preſcribed *Juleps*, *Apozems*, *Powders*, and *Confections*, by which the rage of the Blood, and the burning of the Animal Spirits may be allayed.

A Julep.

Take *of Pipin Water, Black Cherry Water, and Cowſlip Water, each four ounces; Water of the whole Citrons two ounces, of Pearl powder'd one dram, of Syrup of the juice of Citron one ounce; mingle them and make a Julep: let three ounces be taken three or four times in a day.*

An Apozem.

Take *of Graſs Roots, of the Leaves of Wood-Sorrel, and Pimpernel, each one handful; of Barly half an ounce, of Apples cut, of Currans, or Strawberries, or Rasberries, one handful; let them be boiled in four pints of ſpring-water, till a third part be conſumed; clariſie it, and ſtrain it; then add to it of the Syrup of Violets one ounce, and of Sal Prunella a dram and a half.*

A Drink. Take *of the Leaves of Borage freſh gathered and young, four handfuls, of Wood-Sorrel two handfuls, two Apples ſliced, of Sal Prunella two drams, the pulp of one Orange, of white Sugar one ounce; let them be bruiſed together, and pour to them of ſpring-water two or three pints; let them be ſtrongly ſqueezed forth, and kept in a Glaſs, and cleared from its ſetling; let ſix or ſeven ounces be taken of this often in a day, when they will. For the quenching of thirſt, let the excellent drink of Palmerus,* viz. *Spring-water with Sugar, and the juice of Lemons, or Water, or Poſſet-drink with Elm leaves, or Pimpernel infuſed or boiled in it, be drunk: Emulſions of the Decoction of the roots and flowers of Water-Lilies, with Melon-ſeeds; or elſe Spring-water diſtilled with the pulp of boiled Apples diſſolved in it.*

Hypnoticks. *Hypnoticks* or Medicines cauſing reſt, are often very neceſſary in this Diſeaſe; but yet the ſtronger are not convenient in the beginning, nor let them be frequently uſed; becauſe ſleep cauſed by Opiates, carries more morbific matter to the Brain, and fixes it more deeply there.

Take *of the Water of Cowſlip flowers four ounces, of the Syrup of Poppies half an ounce, of Pearl one ſcruple; make a drink to be taken at night late.*

Take *of the Seeds of white Poppy two drams, of Sugar-Candy a dram and a half; bruiſe them together, and pour to them of white Poppy Water ſix ounces; make an expreſſion, to be taken after the ſame manner.*

Narcoticks or Stupefying Medicines, which are made of things meerly cold, are cautiouſly to be exhibited; becauſe they agree not with ſome, who have the Fibres of their Stomach very tender and ſenſible. I have often obſerved theſe kind of *Hypnoticks*, to have ſtirred up a great oppreſſion in the Ventricle, and then preſently an Inflation or blowing of it up; and a little after diſtractions and inordinations of Spirits uſe to follow in the Brain, yea in the whole Body; ſo that there was not only a fruſtration of ſleep, but great diſquietneſs was ſtirred up.

Take *of liquid Laudanum, prepared with the Salt of Tartar, or the juice of Quinces, Let a Doſe of it be taken in a convenient liquor.*

External Medicines cauſing Sleep. Things inviting Sleep, as *Epithems* or moiſt Medicines applied to the Temples and Forehead, are often uſed with ſucceſs; of which ſort are Roſe-cakes dipt in Vinegar, Roſe-water, and grated Nutmeg, an Embrocation or waſhing with Water or Milk, Oyntments of Oyl of Nutmeg by expreſſion, Oyntment of Poplar, to which ſometimes may be added *of Opium five or ſix grains*; or a Cake of Poppy flowers, with Vinegar and Nutmeg, *&c.* Further, for this end, rather than for the taking away the inflammation of the *Meninges, the hot Lungs of a Lamb or Weather*, as alſo *Pigeons or Chickins ſlit in two*, do often give notable help. *Epithems.* Alſo for this uſe *Houſleek bruiſed, and mixt with a Womans Milk, and applied to the hinder part of the Head being ſhaved, is wonderfully praiſed*; Alſo *the Epithem of Penotus, of twelve grains of Nutmeg, of Camphir half a ſcruple, and the Tincture of Roſe-water impregnated with red Sanders twenty ounces, is commended by ſome.*

Further, they are wont to apply *Epithems* not only to the Head, but alſo to the Heart, Liver, and other parts: *A little bag of ſilk may be applied to the Precordia, with Cardiac Species being ſewed or quilted in it, with ſilk, and ſprinkled with Roſe-water, or Vinegar of Roſes*; alſo *rags wet in Roſe Vinegar, may be laid to the Teſticles: The Feet way be bathed with a Decoction of Willow leaves, Lettice, or the heads of white Poppy.* But theſe kind of cooling Topicks only, and cheriſhers are to be uſed in the beginning of the Diſeaſe; but in its height, reſolvers and ſoftners, are to be added, as *the Flowers of Chamomel, Melilot, Elder, &c.* alſo *the leaves of Mallows, Orage, Marjoram, Hyſop*, and ſuch like: In the declining of the Diſeaſe, reſolvers only, and thoſe ſparingly are to be adminiſtred.

The means for the preſerving of ſtrength. In the mean time, there ought to be great means uſed, for keeping up of ſtrength, for that too much failing, all hopes of Cure is loſt. For ſtrength is quickly worn out, by reaſon of great watchings, the perpetual agitations both of the body and mind, a thin Dyet, and Phlebotomy ſometimes often requiſite. Wherefore, great care muſt be had, leſt whilſt we endeavour to root out the Diſeaſe, by Purging or frequent letting of Blood, we ſhould ſuddenly debilitate the Vital Function; If this begins to fail, the *Phrenſie* being let alone, a better dyet may be granted, and eſpecially Cordials are to be uſed.

Take

Take *of the Tincture of Coral half an ounce, take of it twenty drops, twice or thrice in a day, with a Doſe of a Cephalick or a Cordial Julep; or let it be given with Coral diſſolved in Milk, made with the juice of Oranges, one ſpoonful often in a day.* Cordials.

Take *of the Rob or Conſerves of Rasberries, and Barberies one ounce, of prepared Pearl, of Magiſtery of Coral, each one dram; of Confection of Hyacinthæ two drams, Syrup of the juice of Alchermes, what will ſuffice; make a Confection, and let the quantity of a Nutmeg be taken three or four times a day, drinking after it of the following Julep three ounces.*

Take *of the Water of the Flowers of Water-Lilies, red Roſes, and of Elm leaves, each three ounces; of the Syrup of Coral two ounces, of the Cordial Water of Saxony one dram; mingle them.*

Take *of the Conſerves of the Flowers of Water-Lilies, and of Violets, each one ounce; the Stalks of Lettice candied or preſerved half an ounce, of the Powder of red Coral, bruiſed in a morter with the juice of Orange and dryed, two drams; of the Species of Diamarg. frigid. one dram, of white Poppy ſeeds one dram and a half, with what will ſuffice of the Syrup of the juice of Wood-Sorrel; make an Electuary; let the quantity of a Nutmeg be taken often in a day.*

In the *Phrenſie*, not only the Belly, but alſo the Bladder, and their offices, ought to be thought on, and often ſolicited or provoked.

Wherefore, the ſick are to be warmed, and the Urinal given them, and asked to make water; but if they will not, or cannot, let the region of the yard below the belly be bathed *with a Decoction of Pellitory of the wall, Elder Flowers, and of the Seeds of Parſley, and wild Carrot Seeds, or daucus; with a Spunge; and after the Fomentation, anoint it with Oyl of Scorpions, and Oyntment of Dialthæa: In a long ſuppreſſion of Urine, you may put up to the bladder a piece of Wax Candle.*

The Hiſtories and caſes of *Frantick* people are ſo many, and ſo diverſly deſcribed, and ſo accurately by *Hippocrates* in his Books *De Epidem.* that there ſeems little need here to add others; eſpecially, becauſe it would be an immenſe work and tedious, to relate the various manner and caſes of Mad-men: In the mean time, as to the event of the Diſeaſe, there is great diverſity; for that for the moſt part the Feavour being cured, the *Phrenſie* ceaſes by little and little; or elſe, that having no, or an evil, *Criſis*; either death, or a long raving follows. But that our *Hypotheſis*, of the Inflammation of the Spirits, may be illuſtrated, I ſhall propoſe here one more rare inſtance. *The Hiſtories of ſick perſons in* Hippocrates Lib. Epidem.

I was one time ſent for to Cure a Maid, that was ſtrong, and having a Feavour, was highly raging, being continually bound in her Bed. I took from her a great quantity of Blood, and cauſed it to be again iterated; I often took down her Belly with Clyſters; yea I ordered all the other adminiſtrations in order, uſual in this caſe; in the mean time ſhe took *Juleps*, *Emulſions* and *Hypnoticks*: But theſe little or nothing availing, ſhe continued ſtill for ſeven or eight days without ſleep, and furious, perpetually calling and bauling for cold drink; wherefore an *Hydropick* being granted her at her pleaſure, yea to ſatiety; ſhe was nevertheleſs not any thing leſs quiet, or thirſty: I therefore bid them (for that it was Summer time) that in the middle of the Night ſhe ſhould be carried by Women forth of doors, and put into a Boat, and her Cloths being pull'd off, and ſhe tyed faſt with a Cord, ſhould be drenched into the depth of a River, the Rope being tyed only about her middle, that ſhe might not be ſtifled in the Water; but there was no need of that, for the Maid of her own accord, fell to ſwimming, that ſcarce any Man could do it better, who had learned the art: After about a quarter of an hour, ſhe came forth of the Water ſound, and ſober, and then being had to Bed, ſhe ſlept, and ſweat very much, and afterwards, without any other Remedy ſhe grew well. This Cure ſucceeded ſo happily and ſo ſuddenly, foraſmuch as the exceſs both of the Vital and the Animal flame, being together immenſly increaſed, was taken away by a proper Remedy for the more intenſe Fire; to wit, by the moiſtning, and cooling of the Water. *A notable Hiſtory.*

CHAP. XI.

Of Melancholy.

The Diſtemper of the Animal Spirits, being after a diverſe manner, as it is the cauſe of the Phrenſie, ſo it is of Melancholy, Madneſs, and Stupidity.

AS the *Phrenſie* ariſes from the burning of the Animal Spirits, (as we have elſewhere ſhewn) or as *Proſper Mart.* ſeems to affirm, from their ſubſtance being inflamed; ſo indeed other Diſtempers of raving ariſe from their ſubſtance being altered by other ways, and from their genuine nature being changed, from a *ſpirituous-ſaline*, into an acetous or ſharp diſpoſition, like to *Stygian* Water, or elſe into a liveleſs; which therefore are either *Melancholy*, or *Madneſs*, or *Fooliſhneſs* or *Stupidity*: of which we ſhall now ſpeak in order, and firſt of all of *Melancholy*.

The definition of Melancholy.

Melancholy is commonly defined to be, a raving without a Feavour or fury, joined with fear and ſadneſs. From whence follows, that it is a complicated Diſtemper of the Brain and Heart: For as *Melancholick* people talk idly, it proceeds from the vice or fault of the Brain, and the inordination of the Animal Spirits dwelling in it; but as they become very ſad and fearful, this is deſervedly attributed to the Paſſion of the Heart.

That it is a Diſtemper of the Brain and Heart.

Its Examples or Types various, and almoſt infinite.

It would be a prodigious work, and almoſt an endleſs task to rehearſe the diverſe manner of ravings of *Melancholy* perſons; and there are great Volumes already of Hiſtories and examples of this ſort; and more new and admirable obſervations and examples daily happen. Fabulous antiquity ſcarce ever thought of ſo many *metamorphoſes* of men, which ſome have not believed really of themſelves; whilſt ſome have believed themſelves to be Dogs or Wolves, and have imitated their ways and kind by barking or howling; others have thought themſelves dead, deſiring preſently to be buried; others imagining that their bodies were made of glaſs, were afraid to be touched leſt they ſhould be broke to pieces. There are extant manifold and various kinds of the Imagination ſo depraved, concerning which may be commonly obſerved; That the diſtemper'd are *Delirious* as to all things, or at leaſt as to moſt; ſo that they judge truly almoſt of no ſubject; or elſe they imagine amiſs in one or two particular caſes, but for the moſt part in other things, they have their notions not very incongruous. We ſhall firſt inquire into this more univerſal Diſtemper, for that the Imagination is prevaricated concerning very many things; to wit, by what cauſes, and with what difference of Symptoms, this is wont to come to paſs; afterwards we ſhall ſpeak of the ſpecial raving or idle talking.

Melancholy is either, 1. Univerſal, or

2. Particular.

The primary Phænomena of a Melancholick Delirium.

Although the univerſal Diſtemper of *Melancholy* contains manifold Delirious *Symptoms*, yet they chiefly conſiſt in theſe three; 1. That the diſtemper'd are almoſt continually buſied in thinking, that their *Phantaſie* is ſcarce ever idle or at quiet. 2. In their thinking they comprehend in their mind fewer things than before they were wont, that oftentimes they roll about in their mind day and night the ſame thing, never thinking of other things that are ſometimes of far greater moment. 3. The *Ideas* of objects or conceptions appear often deformed, and like hobgoblins, but are ſtill repreſented in a larger kind or form; ſo that all ſmall things ſeem to them great and difficult.

After this manner the *Phantaſms* in the Brain evilly affected, are objected to the Intellect, almoſt after the ſame manner as the viſible images are ſhewed to the Eye, by the interpoſition of ſome Optick Glaſs; to wit, where every object appears an horrid and huge monſter, and for that reaſon a ſmall portion only of the viſible matter or thing, being increaſed to that immenſity, is received by the aſpect; then by reaſon of its horrid and unuſual appearance, the image being once conceived, is not eaſily or ſuddenly let go: we will now conſider by what affection of the Brain and Spirits, theſe appearances happen.

From what diſpoſition of the Spirits they proceed.

Here we ſhall firſt of all inquire into the diſpoſition or preternatural Conſtitution of the Animal Spirits: For inaſmuch as they are after an irregular manner, they always or for a long time continue in their irregularities; and when the *Palſie*, *Apoplexy*, *Vertigo*, or *Convulſion*, are not joined to this Diſtemper of theirs, which argue obſtructions of the Brain, it may be inferred, that the Animal Spirits, not fetching their force elſewhere, are driven into ſuch inordinations; nor do chiefly conceive their diſorders, by reaſon of the Pores and paſſages of the Brain being obſtructed; but rather, in this caſe, they cauſe theſe aforeſaid *Symptoms* in the ſick from the default of their own Nature.

Such

Such an indiſpoſition of the Animal Spirits is wont to be deſcribed after this manner; to wit, that they, when as they ought to be tranſparent, ſubtle, and lucid, become in *Melancholy* obſcure, thick, and dark, ſo that they repreſent the Images of things, as it were in a ſhadow, or covered with darkneſs: The explication of which does not ſeem incongruous; foraſmuch as we have already ſhewed, that the Animal Spirits flowing forth from the inkindled Blood, go forth after a manner, as the rays of light from a flame. And it ſufficiently appears, that the light ſhews and illuſtrates it ſelf diverſly, according as it proceeds from the burning of bodies, flaming forth after a various manner; as of Spirits of Wine, Oyl, Fat, Mineral Sulphur, Nitre, and others: in like manner the Animal Spirits, foraſmuch as ſtilled forth from the Blood, having got this or that, or ſome other diſpoſition, they are either ſubtil, clear, or dull, thick, and as it were ſooty, they variouſly paſs thorow and irradiate the organs of the Animal Functions, and ſo for that reaſon, diverſly pervert their actions.

As they are compared to Light, they are called opacous, or full of darkneſs.

But further, when as the Animal Spirits are not wholly looſe and free as the little bodies of light, but mutually cohere or ſtick together, and leſt the continuity of the ſoul ſhould be broken off, they ought to be contained in a certain *Latex*; therefore theſe, with the Vehicle to which they cleave, may be very aptly compared to ſome *Chymical* Liquors, drawn forth by diſtillation from natural mixtures. Which *Analogy* indeed ſeems fitteſt for the unfolding the mad diſtempers.

Theſe kind of Spirits in Melancholy compared to thoſe in Chymical Liquors.

1. Liquors *Chymically* Diſtilled, are, according to the active Elements after a various manner combined in them, of a diverſe kind: the chiefeſt of theſe, by the conſent of all, are ſaid to be ſuch, as in which the Spirit being united with the Salt, doth volatiſe it, and on the other ſide is ſharpned by it, and after a ſort fixed or kept. Of this ſort they conceive the great *Elixir* and the Liquor *Alcaheſt* to be; and indeed in a manner are the Spirits of Blood, of Harts-horn, of Soot, and ſuch like, very ſubtil, volatil, and penetrating, yet not apt to be inflamed, or ſuddenly to be diſſipated. And indeed, the Animal Spirits ſeem to be after a manner, having obtained a ſound and legitimate diſpoſition, like a ſpirituous liquor ſtuffed with a volatile Salt, which is diſtilled from Blood; beſides, to this there is given from the fire an high Acrimony and *Empyreuma*, or ſmatch of burning, which are wholly abſent from the liquor watering the Brain and Nerves.

1. *They are not like the Spirit of Blood, as they ſhould be.*

2. Other *Chymical* Liquors are ſulphureous and burning, as the Spirits of Wine and Turpentine, which conſiſting of Spirit and Sulphur combined together, are eaſily inflamed, and depart one from another of their own accord, and fly hither and thither what way they can find; the Animal Spirits of this nature, as we ſhewed in the former Chapter, ſeem to be in the *Phrenſie*.

2. *Nor like the Spirit of Wine: Such rather in the Phrenſie.*

3. Some Liquors or Spirits are produced by *Chymical* operation, in which the fixed Salt being carried forth to a Flux, hath obtained the dominion; of which ſort are ſuch as are diſtilled from Vinegar, ponderous Woods, and ſome Minerals, with a gentle fire; whoſe particles are very moveable, and unquiet, but of a ſhort activity, ſo that Effluvia's do not long flow from them, that if they ſhould be diſtilled *in Balneo*, nothing but an inſipid Phlegm would be carried into the *Alembick*. And indeed, the Animal Spirits in *Melancholick* Diſtempers, are to be ſuſpected to be of this kind of acetous nature, with the dominion of a fluid ſalt, as ſhall hereafter be more largely ſhewed.

3. *But theſe are like acid Spirits, diſtilled out of Salt, Vinegar, Box, and ſuch like.*

4. Some *Stagmas* drawn forth by *Spagyrick* art, are ſometimes moſt ſharp, to wit, in which the untamed Particles of a fluid Salt, and alſo *Sulphureous*, and *Arſenical*, being combined together, are exalted; as are the *Stygian* Waters diſtilled out of *Nitre*, *Vitriol*, *Antimony*, *Arſnick*, *Verdigriece*, and the like, all which are of a fierce nature, very penetrating and not to be broken, ſo that their *Effluvia's* are agitated with a perpetual motion, penetrate every thing, and are alſo diffuſed far and wide. And theſe kind of Liquors, may be aptly likened to the diſpoſition of the Animal Spirits, acquired in *Madneſs*, as ſhall be anon declared.

4. *Stygian Waters are like the Nature of the Animal Spirits in Madneſs.*

But for the preſent, that we may deliver the formal reaſon and cauſes of *Melancholy*, let us ſuppoſe, that the liquor inſtilled into the Brain from the Blood (which filling all the Pores and paſſages of the Head, and its nervous *Appendix*, and watring them, is the Vehicle and bond of the Animal Spirits) hath degenerated from its mild, benign, and ſubtil nature, into an Acetous, and Corroſive, like to thoſe liquors drawn out of Vinegar, Box, and *Vitriol*; and that the Animal Spirits, which from the middle part of the Brain, irradiating both its globous ſubſtance, as alſo the nervous *Syſtem*, and do produce all the Functions of the Senſes and Motions, both interior and exterior, have ſuch like Effluvia's, as fall away from thoſe Acetous *Chymical* Liquors. Concerning which there may be obſerved theſe three things, 1. Their being

The formal Reaſon of Melancholy aptly repreſented by acetous Chymical Liquors.

There are three chief affections of theſe, which agree with the Animal Spirits in Melancholy.

being in perpetual motion: 2. Not long able to flow forth: 3. not only to be carried in open ways, but to cut new Poroſities in the neighbouring bodies, and to inſinuate themſelves into them. From the *Analogy* of theſe conditions, concerning the Animal Spirits, it comes to paſs, that *Melancholick* perſons are ever thoughtful, that they only comprehend a few things, and that they falſly raiſe, or inſtitute their notions of them. We ſhall conſider of each of theſe a little more largely.

1. Effluvias falling away from theſe Liquors are perpetually in motion.

1. Therefore we ſhall take notice, that the Effluvia's falling away from theſe diſtilled Acetous Liquors, are perpetually in motion: for the Spirits of Vitriol, or of Vinegar, or Sea Salt continually evaporate: the reaſon of which is, becauſe thoſe Particles of the fluid Salt do ſcarcely agree with any others, but where ever they are ſtopped, being apt immediately to leave their ſubjects, ſeem to endeavour to get new conſorts. And hence ſome have thought nothing more like to perpetual motion, than the Acid Spirits of Minerals, ſhut up and *Hermetically* ſeal'd in a Phial; for ſo the Vapours or Effluvia's will creep about the ſides of the Glaſs, with a continual Circulation. In like manner we may ſuppoſe, That the nervous Acetous Liquor is inſtilled from the Blood, ſometimes ſtuffed with a fixed Salt, or with Vitriolick Particles, or other heterogeneous, into the Brain, for the matter and Vehicle of the Animal Spirits; and ſo theſe being admitted within the middle part of the Brain, for the acts of the Animal Functions, do not quickly paſs thorow and irradiate all the Pores and Paſſages, but like little acid Atoms, creep about here and there, ſlowly, but inceſſantly, and as it were with a certain unquiet motion of tingling or creeping, diffuſe themſelves by little and little thorow the whole neighbourhood: Hence a ſtorm of thoughts is perpetually ſtirred up, by which the Brain is wont to be buſied without intermiſſion; ſo that *Melancholic* perſons have continually, day and night, diſturbed Phantaſies; for that their Animal Spirits conſiſt of a continually moveable matter; Hence alſo they look with eyes turned inwards, or fixed, or obliquely, and ſullen or dogged, and exerciſe the other faculties both ſenſitive and loco-motive inadvertently; becauſe the Spirits being worn out and diſtracted by continual motion, do not well actuate or beam into the nervous *Syſtem*.

In like manner alſo the Spirits in the Phantaſie of a Melancholick perſon.

2. Effluvias from acetous Chymical Liquors do not proceed far.

2. Though the Effluvia's continually fall away from an Acetous Spirit, prepared by *Chymical* Art, yet they do not go far, but gather together on an heap thickly, near the ſuperficies of the liquor, and penetrate only the neighbouring bodies, not touching thoſe that are at a diſtance: Hence the Spirits of *Vitriol*, Salt, or Vinegar, will not aſcend out of the *Cucurbit* into the *Alembick* unleſs urged with a very ſtrong heat; but being included in a low *Phial*, they ſhall corrode and pierce thorow the ſtopple.

In like manner the imagination of a Melancholick Perſon, though always employ'd, comprehends only a few things.

It is after the ſame manner, concerning the *Phantaſie* of *Melancholick* perſons; for inaſmuch as the Animal Spirits being degenerate into an acid nature, do not irradiate or quickly paſs thorow the whole compaſs of the Brain, as before, but flowing in the middle part, are carried with its force only into the neareſt Pores and Paſſages; therefore cogitations raiſed up from thence, though they be continual, yet they comprehend but a few things: and ſo, as when many bands of Spirits are thruſt together in ſtrait bounds, every ſmall object, and of very little moment, ſeems to them very great and of notable weight; certainly after the ſame manner, and for the ſame reaſon, as when the viſible images paſſing thorow a *Microſcoptick* Glaſs are carried to the Eye; for, becauſe many beams of the ſame thing are concenter'd, its magnitude ſeems to be increaſed into an immenſe greatneſs; ſo when as every intentional Species or Image, by the conflux of very many ſpirits together, is formed in the Brain, it appears to the ſoul greater and of more weight than uſual. Every one may experiment this truth in himſelf: For when as we become thoughtful, from eating groſs or melancholick meats, or by reaſon of the paſſion of ſorrow (the reaſon of which affection is, becauſe the Animal Spirits are unfit for a more free expanſion) then we are very ſolicitous and fearful, concerning every little thing, as if then our health or fortune were for ever in danger. Hence alſo, becauſe the Animal Spirits, though almoſt ever in motion, are notwithſtanding ſtill limited within the ſame ſhort bounds, *Melancholick* perſons perſiſt a long while in thinking and revolving in their mind often the ſame thing.

And therefore every thing is conceived with a greater Image than it ſhould be.

3. Effluvias from acetous Liquors do not evaporate ſo much from open Pores, as they make new.

3. But there yet remains another ſimilitude of the Animal Spirits, with thoſe diſtilled from *Vitriol*, and other ſaline bodies, to wit, that as the Effluvia's ſent away from theſe kind of Acetous Spirits, do not evaporate ſo much from open ſpaces and tracts, before made, as they cut out Pores and Paſſages that are new, for themſelves, in an objected body; ſo that they eaſily paſs thorow, and render friable or crumbling, the Cork or ſtopple to the Veſſel where they are; which happens not from the Spirit of Wine, to any thing that ſtops up the Phial; ſo indeed in *Melancholick* perſons, it is uſually wont to be. For becauſe the Animal Spirits, being as it were pointed with

ſaline

ſaline Particles, whilſt they flow from the middle of the Brain, they obſerve not their former tracts and ways of their expanſion, but they thickly make for themſelves new and unwonted little ſpaces, within the globous ſubſtance of the Brain: Hence cogitations are brought before the Soul, not ſuch as they were wont to be, but new and incongruous, and for the moſt part abſurd. But indeed, becauſe the *Phantaſie* is prevaricated, about the Conceptions of things, and by reaſon that the acts of judgment and reaſon are falſly framed, the only cauſe is, for that the Animal Spirits leaving their former walks, and going backward and forward in their ways in the Brain, being carried hither and thither obliquely and tranſverſe, affect altogether unaccuſtomed and bye ways, which indeed is proper for them to do, out of the Acetous diſpoſition, with which they labour; to wit, foraſmuch as the Effluvia of thoſe kind of Liquors expand themſelves not in a direct or free emanation, as the rays of light; but by a bending motion, and as it were creeping, they craul on every ſide into the neighbouring part.

And in like manner the Animal Spirits, whilſt they form in the Brain new Tracts, produce unwonted and incongruous Notions.

Thus much for the primary *Melancholick* Diſtemper, to wit, a *Delirium* or Raving, being excited by reaſon of the vices of the Spirits inhabiting the Brain: The beginnings of which, although they proceed chiefly, and oftentimes, almoſt only from the Acetous diſpoſition of the Spirits, yet afterwards, the conformation of the Brain it ſelf is often brought to be a part of the cauſe; to wit, foraſmuch as the Recrements of the *Melancholick* Blood, being perpetually poured forth, renders its ſubſtance more thick and dark, and the primary tracts or paths of the Animal Function being near blotted out, new, oblique, and by-paths are made; inſomuch, that the Spirits, though better ſhould be begotten, could not eaſily irradiate the Brain, or preſently recover their former paſſages.

In Melancholy, after the Animal Spirits being for ſome time vitiated, the Conformation of the Brain is alſo hurt.

Melancholy is not only a Diſtemper of the Brain and Spirits dwelling in it, but alſo of the *Præcordia*, and of the Blood therein inkindled, from thence ſent into the whole Body: and as it produces there a *Delirium* or idle talking, ſo here fear and ſadneſs; but by what means we ſhall now ſee.

The Affection of the Præcordia in this Diſeaſe, as to fear and ſadneſs, is delivered.

Firſt, in Sadneſs, the flamy or vital part of the Soul is ſtraitned, as to its compaſs; and driven into a more narrow compaſs; then conſequently, the animal or lucid part contracts its ſphere, and is leſs vigorous; but in Fear both are ſuddenly repreſſed and compelled as it were to ſhake, and contain themſelves within a very ſmall ſpaces; in either paſſion, the Blood is not circulated, and burns not forth lively, and with a full burning, but being apt to be heaped up and to ſtagnate about the *Præcordia*, ſtirs up there a weight or a fainting; and in the mean time, the Head and Members being deſtitute of its more plentiful flux, languiſhes. The formal reaſons of theſe Diſtempers, and their cauſes, we have before expoſed.

After what manner the Corporeal Soul is affected in theſe two paſſions.

But becauſe theſe are habitual in *Melancholick* perſons, the cauſe is partly in the Blood, and partly in the Animal Action of the heart. For the Blood, becauſe of the ſaline particles being exalted, becomes leſs inflamable; from whence it is neither ſufficiently inkindled in the Lungs, or doth it burn with a plentiful and enough clear flame within the paſſages of the Heart and its veſſels; but is apt to be repreſſed, and almoſt blown out with every blaſt of wind: Hence, when that the vital flame is ſo ſmall and languiſhing, that it ſhakes and trembles at every motion, it is no wonder if that the *Melancholick* perſon is as it were with a ſinking and half overthrown mind always ſad and fearful. By reaſon of this kind of ſaltiſh *Dyſcraſie* of the Blood, *Melancholicks* rarely have a Feavour; yet being taken with it, by reaſon of the irregular burning of the Blood, they are more in danger.

The cauſe of either depends partly on the blood;

No leſs doth it come to paſs, by the fault of the Heart, that *Melancholick* perſons become ſad and fearful, by reaſon of the courſe of the Blood being retarded, and called back from thence: for, becauſe that Muſcle is actuated but with an inflowing of weak and enormous Spirits, it cannot perform its contractions ſtrongly enough, and conſtantly, whereby the Blood may be driven forward into the whole body, without ſtop or leaping back: So the Blood and the Animal Spirits affect one another mutually, with a reciprocal evil, and bring hurt one to the other. That is, the *Melancholick* Blood conſiſting of *Saline* Particles, carried forth together with *Sulphureous*, begets Animal Spirits, indued with an Acetous nature, as hath been ſhown; and theſe Spirits wrongly performing the offices of the Vital Function, cauſe ſuch an evil diſpoſition of the Blood to be increaſed.

and partly on the Animal Action of the Heart.

Thus much of *Melancholy* in general, *viz.* of its Eſſence, Conjunct Cauſes, and chief *Symptoms*, together with the reaſons of them. Before we proceed to the kinds and differences of this Diſeaſe, we ought to explain, from what kind of cauſes, both *Procatartick* and Evident, it is wont to ariſe, and to be cheriſhed; and firſt, from whence either part of the Soul, *viz.* both Animal and Vital, doth acquire their morbid diſpoſitions.

The procatartick Cauſes of Melancholy are,

First

Partly the acetous Nature of the Spirits, and partly the Melancholy Dyſcraſie of the Blood: The Diſtemper begins ſometimes from this, ſomtimes from that.

First we ſay, the former of theſe to be Acetous, like to the Spirit of *Vitriol* or Vinegar, and this to be *Salino-ſulphureous*, or Atrabilary or Melancholick; further, as the one doth cheriſh the other, ſo they at firſt beget one another. For ſometimes *Melancholy* beginning, and for a long time perſiſting, from the Animal Spirits being diſturbed, and driven into a certain confuſion, cauſes the *Melancholick* diſpoſition of the Blood; and ſometimes alſo the Blood, at firſt contracting this evil diſpolition, perverts the nature of the Spirits.

How it begins from the Spirits and the Animal Government.

That *Melancholy* doth very often ariſe from the Animal Government, every common body doth ſufficiently note; to wit, foraſmuch as the Animal Spirits conceive inordinations from violent paſſions of the mind, in which, when they remain long, they bend the whole Soul, yea and the Body, from their due temper and conſtitution: So eſpecially deſtroying Love, vehement ſadneſs, panick fears, envy, ſhame, care, and immoderate ſtudy, are wont oftentimes to excite this Diſtemper. For by reaſon of theſe kinds of occaſions, the Animal Spirits being thruſt down, beyond their wonted paths of expanſion, and remaining in their error, by reaſon of the aſſiduity of Paſſion, at laſt they go into theſe deviating tracts, which afterwards obſerving, they are hardly reduced into their former due ways. Then, foraſmuch as for that reaſon, the motion and vigoration of the Heart (as hath been ſhewed) is leſſened; therefore the Blood is defective in its due temper, and ſanguification, and is from thence made more fixed and *Salino-ſulphureous*, and the Animal Spirits coming from it, are but degenerate into a fourneſs; and ſo the Blood being depraved by the latter, encreaſes to the *Melancholick* diſpoſition, begun from the Spirits.

By what means this Diſeaſe ariſes from the Blood.

No leſs often doth it come to paſs, that the ſeeds of *Melancholy*, being at firſt laid in the Blood, do at length impart their evil to the Spirits: For this reaſon, ſome are made obnoxious to this Diſeaſe from their Parents. But an inordinate living, long intermiſſion of wonted exerciſe, uſual evacuations, as of the Menſtrual Blood, or the Piles, or bleeding at the *Hæmorrhoidal* Veins, alſo the Seed, or the Serous Matter, being ſuddenly ſuppreſſed, and many other occaſions, eaſily infect, and foul the Blood, and render it *Melancholick*; whoſe depraved diſpoſition is of neceſſity communicated to the Spirits.

Melancholy doth not ariſe from an atrabilary humour heaped up in ſome place or mine.

But we cannot here yield to what ſome *Phyſicians* affirm, that *Melancholy* doth ariſe from a *Melancholick* humor, ſomewhere primarily and of it ſelf begotten, and they aſſign for its birth, ſeveral places, to wit, the Brain, Spleen, Womb, and the whole habit of the Body; for beſides, for that no ſuch mines of ſuch an humor appear, unleſs perhaps ſome be planted in the Spleen; moreover the Blood it ſelf is it, which conceives at firſt the *Melancholick* intemperance, or any other by it ſelf, and then depoſes the Recrements of the ſame nature, in proper emunctories or receptacles. For neither is the yellow Bile or Choler laid up in the Gall-Bladder, or the black Bile ſo called, or *Melancholick* humor in the *Spleen*, unleſs the bloody Maſs begets thoſe humors before hand: If at any time theſe, or other Recrements, being any where laid up, are received of the Blood, they produce its effervescency or growing hot, but not preſently or eaſily its intemperature.

By what means according to the Antients, it is ſaid to ariſe from the Head.

Therefore, becauſe ſometimes the original of *Melancholy* is aſcribed to the Head, and the intemperature of the Brain from theſe, to wit, too hot, and accuſed to be from thoſe, too cold, I rather think it ought to be affirmed, that this Diſtemper doth ſometimes at firſt begin from the Brain, and the Soul dwelling in it: becauſe *Hippocrates* alſo plainly aſſerts it, 6 *Epidem. Sect.* 8. *T.* 58. For diſtinguiſhing *Epileptical* and *Melancholick* perſons, being made ſo together, or elſe ſucceſſively, as to the formal reaſons of the Diſeaſes, he ſaith, *The defluxion which floweth from the Brain, from the ill affection, ſtate, or temperament thereof, if it flows into the Body cauſeth the Falling-ſickneſs; if into the cogitation or the mind, Melancholy.* So in *Melancholy* he grants, the Soul diſtinctly, and as it were apart from the Body, or Brain, to be affected.

How from the Womb.

Secondly, Becauſe ſometimes the original of this Diſeaſe is deduced from the Womb, it is not to be thought, that the *Melancholick* humor is there at firſt generated, but the occaſion of *Melancholy* doth proceed from thence; either bacauſe the whole Blood being infected, and made degenerate by reaſon of a ſtoppage of the *Menſtrua*, ſtrives to go into a *Melancholy Dyſcraſie* or intemperature; or becauſe, by reaſon of the provocations of *Venus* or Luſt, being reſtrained, not without great reluctancy of the Corporeal Soul, the Animal Spirits being for a long time forced, and reſtrained, become at length more fixed and *Melancholick*.

How from the Spleen.

Thirdly, It is a common opinion, and alſo ours, that ſometimes *Melancholy* is either primarily excited, or very much cheriſhed from the Spleen, being evilly affected, and ſo from thence is called by a peculiar word, *Hypochondriack*; as we have ſhewed at large in another Tract of Convulſive Diſeaſes. But the Blood is firſt in fault, begetting

ting in it self from the beginning *Melancholick* foulneſſes, depoſes them in the Spleen, which receiving again, after their being exalted into the nature of an evil Ferment, is more vitiated in its diſpoſition, by their foulneſs.

Fourthly, But beſides, it is ſaid, there is another kind of *Melancholy*, diſtinct from the *Hypochondriack*, and the former, that is begotten in the whole Body together; this is nothing elſe, than the Maſs of Blood being degenerated from its true nature, by reaſon of errors in the ſix non-naturals, and for many other occaſions, doth acquire an *Atrabilary* or *Melancholick* diſpoſition; that is, where the Spirit being depreſſed, the *Sulphureous* Particles, together with the *Saline*, and alſo with ſome *Earthy*, are carried forth; for the *Melancholick* diſpoſition of the Blood is very much a-kin to this *Sulphureous-ſaline*, which we have ſhewed oftentimes to excel in ſome kind of *Scurvy*. For what cauſes, and upon what occaſions, this is wont to be produced, may be ſufficiently known from the *Ætiology* of that Diſeaſe, being at large explained. *How from the whole Body.*

The differences of this Diſeaſe may be eaſily gathered from what hath been ſaid: for in reſpect of its firſt ſubject, which is ſometimes the Soul, ſometimes the Body, or rather the Blood, it is called either Animal or humeral *Melancholy*. Again, it is impreſſed according to that, with various powers, to wit, it is firſt impreſſed either on the Rational Will, or the ſenſitive, concupiſcible, or iraſcible Appetite; alſo it is divided into very many kinds, as it is employed about diverſe things, to wit, either Sacred, or Magical, or Humane, the huge cenſe or bead-roll of which is almoſt infinite; the chief of which, that are wont to come within the Cure of Medicine, are Religious, Amorous, and Jealous *Melancholy*. *The Differences of the Diſeaſe.* *1. In reſpect of its firſt Subject.*

2. By reaſon of the temperament of the ſick, according to which, the Particles of the *Melancholick* blood, being made ſometimes *Sulphureous*, ſometimes Saline or Earthy, the Spirituous being depreſſed, are exalted more or leſs, a *Delirium*, or ſadneſs, fury, or ſtupidity, are more or leſs variouſly joined to *Melancholy*. *2. By reaſon of the Temperament of the Sick.*

3. The Diſeaſe is either continual or intermitting, according to the conjunct cauſe, either ſtronger, both the *Hypoſtaſis* of the Spirits, and alſo the bloody Maſs, being both together vitiated; or elſe lighter, and leſs deeply fixed; ſo that the Diſtemper'd ſometimes are well enough for many days or months, yet apt to relapſe upon any great occaſion. *In reſpect of the next Cauſe, as it is ſingular, or conjunct.*

4. In reſpect of the hurt Imagination, there are very many types of *Melancholicks* to be met with, yea almoſt innumerable; yet the chief difference of which is, that ſome are delirious in all things, and others in one thing only. *In reſpect of the Imagination diverſly hurt.*

The *Prognoſtick* of this Diſeaſe, though as to health or death, it is for the moſt part ſafe; yet by reaſon of the event, it is very uncertain: For ſome quickly grow well, others not of a long time, and others are never cured. *The Prognoſtick of this Diſeaſe.*

This Diſtemper ſuddenly excited, from a ſolitary evident cauſe, as a vehement Paſſion, is far ſafer than by leaſure invading, after a long *Procatarxis* or foregoing cauſe. For the former, if the evident cauſe be preſently removed, often ceaſes of its own accord, or with a little help; but in this latter, for that the Maſs of Blood, and the whole heap of Animal Spirits, are departed from their due diſpoſition, and not rarely the conformation of the Brain, as to the tracts of the Spirits, is altered; The Cure very difficultly, and not under a long time ſucceeds.

Melancholy being a long time protracted, paſſes oftentimes into Stupidity, or Fooliſhneſs, and ſometimes alſo into Madneſs; further, ſometimes it brings on Convulſive Diſtempers, or the *Palſie*, or *Apoplexy*, yea ſometimes a violent Death.

As to the Cure, there is little or no hopes, if the Diſtemper'd being very contumacious and refractory, reject all Medicines, and every method of Phyſick. Further, there is ſcarce any better thing to be expected from them, who lying ſick with only imaginary Diſeaſes, take all Remedies, and require ſtill more, and of diverſe kinds, to be given them.

As the Cure of *Melancholy*, as it is always difficult and long, ſo it is wont to be mighty intricate and perplexed; for that it ought to be diverſly and variouſly inſtituted, in reſpect of the evident, *Procatartick*, and Conjunct cauſes of its kind, alſo by reaſon of the *Symptoms* daily ariſing. Neither is it only behoveful oftentimes to change the Remedies, and Method of healing, but alſo variouſly to make uſe of between whiles, warnings, deceits, flatteries, intreaties, and puniſhments. *The Cure of the Diſeaſe.*

But firſt of all, the Evident Cauſe of this Diſeaſe, if any noted thing went before, ſhould be inquired into; and if it may be, either preſently removed, or elſe its removal to be in ſome ſort feigned. Further, the affections of the mind being vehement, and ſtirred up from thence, are either to be appeaſed, or ſubdued by others oppoſite. Wherefore, to deſperate Love ought to be applied or ſhewed indignation and hatred; Sadneſs is to be oppoſed with the flatteries of Pleaſure, Muſick, a deſire of vain glory, *The evident Cauſe firſt to be removed.*

or alſo a *pannick* terror. In like manner, as to the reſt of the Paſſions, you muſt proceed to quiet, or elude them.

Three primary Indications.

The *Curatory* Method, accommodated for the healing of *Melancholy*, ſuggeſts many other Indications, the chief of which, and to which the reſt may be the better placed, are theſe three, commonly noted, *viz. Curatory*, which reſpects immediately the Diſeaſe, and its Conjunct Cauſe; *Preſervatory*, which cuts off the *Procatartick*, and Evident Cauſes; and *Vital*, which is imployed about conſerving of ſtrength.

1. Curatory.

As to the firſt Indication, the intention of the *Phyſician* is ſo much to lift up, make volatile, and corroborate the more fixed or dejected Animal Spirits, that being alſo apt to go backwards, or out of the way, that afterwards they may irradiate more freely, being ſtretched forth, the whole Brain, with a full and not broken beam, for the Acts of the Imagination, Judgment, and other principal faculties; and ſo lively actuate the *Præcordia*, and make them to vibrate or beat ſtrongly, that the Blood being more plentifully inkindled, it may be projected from thence, without ſtop or ſtagnating, into the whole Body.

The healing of the Spirits, is beſt performed by admonitions and artificial inventions, concerning the buſineſs of Life.

Therefore, for the healing of the Spirits, firſt of all it is to be procured, that the Soul ſhould be withdrawn from all troubleſome and reſtraining paſſion, *viz.* from mad Love, Jealouſie, Sorrow, Pity, Hatred, Fear, and the like, and compoſed to chearfulneſs or joy: pleaſant talk, or jeſting, Singing, Muſick, Pictures, Dancing, Hunting, Fiſhing, and other pleaſant Exerciſes are to be uſed. They who care not for Sports or Pleaſures (for to ſome *Melancholicks* they are always ingrateful) are to be rouſed up by imploying them in more light buſineſſes; ſometimes *Mathematical* or *Chymical* Studies, alſo Travelling, do very much help; moreover, it is often expedient to change the places of habitation, in their native ſoil. Thoſe who will ſtill ſtay at home, are to be warned, that they take care of their Houſhold affairs, and that they ſhould govern their Family; that they ſhould build Houſes, plant and order Gardens, Orchards, or Till the Ground. For the mind being buſied with neceſſary cares or duties puts aſide, and at laſt deſerts more eaſily, vain and mad cogitations. *Melancholy* perſons are ſeldom to be left alone, for that then they indulge their airy phantaſies and ſpeculations, and ſuffer them to continue longer. The Soul ſinks down inwardly, and leaving the body, enters into a certain *Metamorphoſis*, and puts on a new ſhape, and oftentimes different from humane manners. Wherefore, the Diſtemper'd ought to be diſturbed almoſt always with the diſcourſes of their familiar Friends; to wit, that the Animal Spirits, being called outwards, may be ſolicited from their diverſions, into their former and accuſtomed tracts. But if the ſick be ſeduced with phantaſtical illuſions, and imagine ſome prodigious things of themſelves, and firmly believe them; their mind is to be drawn from them, by artificial inventions; very many cauſes and examples of this ſort of Cure are to be found in Books, and a diſcreet Phyſician may inſtitute the like as occaſion ſerves.

Yet oftentimes there is need of Medicine beſides.

Although a freſh *Melancholy* may be cured ſometimes by the mere diſcipline and inſtitution of the mind and Animal Spirits, yet in a long or inveterate, where the Spirits have contracted an acetous nature, and the Blood an *Atrabilary* or Melancholick diſpoſition, and that the Brain is hurt, as to its Pores and paſſages: other Indications called Preſervatory are required, for the taking away of the *Procatartick* cauſes. Concerning this thing, the Medical intentions are firſt, that the Blood be reduced to a better temper, and genuine, to wit, a ſpirituous ſaline; then to enliven the Brain, and to render it bright and clear, its Pores being unlocked; and alſo to corroborate the Animal Spirits, and to excite them into a lively flowing forth. For which ends, the following method I think good to propoſe, which notwithſtanding ought to be varied, according to the various conſtitutions of the ſick.

The Preſervatory indication, concerning the Procatartick Cauſes of the Diſeaſe.

Phlebotomy.

The taking away of Blood has place almoſt in all *Melancholicks*, and ſometimes it is often to be iterated. For the aduſt and liveleſs Blood, being at times drawn away, a new and more ſpirituous comes in its place. Concerning the quantity, place, and manner of celebrating this Remedy, Authors have various opinions; but the motion and the affections of the Blood, being truly weighed, it will at firſt ſuffice to take a moderate quantity out of the Arm, and afterwards if need be, a leſſer, or to draw it from the Sedal Veins by Leeches. How the *Salvatella* Veins being opened (as is ſaid) ſhould bring ſuch notable help to *Melancholicks*, I confeſs I cannot underſtand: perhaps it may help them, if the *Melancholick* perſons be firmly perſwaded, that this *Phlebotomy* will cure them before any others: the frequent opening the *Hemorrhoidal* Veins, invites Nature to an indeavouring afterwards for that evacuation, which ſucceeding of its own accord (as *Hippocrates* ſays) does not ſeldom Cure this Diſeaſe.

Purging.

Purging, for that it draws back the nouriſhment of the Diſeaſe, from the firſts ways, and removes the impediments of other Remedies, ought to be celebrated at the beginning,

ning, and repeated at intervals. But that ſome think, for the ſooner rooting out of this Diſeaſe, *Hellebore* or *Elateriums* are chiefly to be uſed, and cite *Hippocrates* for their Author; we apprehend, if the ſucceſs be minded, thoſe things do not ordinarily agree with, yea more often do hurt to the ſick: For indeed, more ſtrong Purgers do not take away the cauſe of the Diſeaſe, to wit, the *Dyſcraſie* of the Blood, but rather encreaſe it; beſides, they more debilitate and ſtrike down the Animal Spirits, before dejected. But *Hellebore* was ſo often preſcribed by *Hippocrates*, becauſe in his Age other *Cathartick* were ſcarcely known, or at leaſt they were not in frequent uſe: But now it is thought much better, gently to draw forth the receptacles of the humors, by more gentle and eaſie Purgers, and to cleanſe only the Viſcera and the firſt ways, without any great commotions of the Blood and Spirits.

Vomiting Medicines (as in moſt *Cephalick* Diſeaſes free from a Feavour) are wont to help after a peculiar manner in all mad Diſtempers. The reaſon of this partly conſiſts in this, becauſe the viſcous load of the Ventricle, which (as we have elſewhere ſhewn) doth very much burthen the Soul, being purged forth, the Spirits by that means being more free, expand themſelves more lively and chearfully. Further, foraſmuch as Vomiting preſſes together and evacuates the neighbouring receptacles of the humors, to wit, the *Gall* Bag, the paſſage of the *Pancreas*, and the *Glandulæ* of the *Meſentery*, procures that their contents be not transferred into the Head. *Vomiting.*

Take *Oxymel of Squills one ounce and a half, of Wine of Squills one ounce, of the Syrup de Peto two drams; mix them, and make a Vomit: if it doth not work, or but ſlowly provoke Vomiting with a great deal of Carduus Poſſet-drink.* *Vomitories.*

Take *of the Decoction of the middle bark of Elder four ounces, of the Salt of Vitriol one ſcruple to two ſcruples, of Oxymel ſimple three drams; mix them, and take it after the ſame manner.*

To robuſt and well ſet perſons may be given *of the Infuſion of Crocus Metallorum, or of Mercurius Vitæ*, alſo *the Emetick Tartar of Mynſicht, or the Sulphur of Antimony.*

Take *of the Root of Polypodium of the Oak half an ounce, of Epithimum three drams, of Sena half an ounce, of Tamarinds ſix drams, of the ſeeds of Coriander three drams, of yellow Saunders two drams; let them be boiled in fourteen ounces of Spring-water, till it comes to ten ounces; adding to the Colature, or when it is ſtrained, of Agarick two drams, of Rhubarb one dram and a half, being clarified, add of the Syrup of purging Apples two ounces; let ſix ounces be taken, and repeated within three or four days.* *Purgers.*

Take *of the beſt Sena three drams, Epithym, Rhubarb, each one dram and a half; of Yellow Saunders half a dram, of Coriander ſeed two ſcruples, of the Salt of Wormwood half a dram, of Celtick Spike a ſcruple; put theſe into white Wine, and the Water of Pipins, of each four ounces, kept cloſe all night; to the liquor being ſtrained five ounces, add of the Syrup of Epithimum ſix drams, of Aqua Mirabilis two drams; mix them and make a Potion. In ſtrong bodies or hard to work on, may be added to theſe, of the ſtrings of black Hellebore macerated in Vinegar one dram or two.*

For thoſe who had rather make uſe of Pills, Boluſes, Powders, or Syrups, take the following.

Take *of Pil. Tartar of Quercitan, or of Amber of Crato half a dram, of the Reſine of Jalap or of Scammony ſix or eight grains, of Tartar vitriolated half a ſcruple, of Ammoniacum diſſolved in Aqua Mirabilis, what will ſuffice to make a Pill: let four be taken going to ſleep, and unleſs they work firſt, one in the morning following.* *Pills.*

Take *of Calamelanos, of the extract of black Hellebore, each one ſcruple; of the Reſine of Jalap ſix grains, of Ammoniacum ſolut. what will ſuffice; make four Pills, let them be taken with Government.*

The Powder of Haly, the Powder of Valeſco de Tarenta, of Peveda and others, are very much commended. And indeed in Country bodies, or robuſt, this Cathartick may ſeem convenient. Take *of Epithimum half an ounce, of Agarick, Lapis Lazuli, each three drams, Scammony one dram, Cloves thirty; make a Powder: the Doſe is from half a dram to a dram.* *Powders.*

Take *of the Powder Diaſenna, of Diaturbith with Rhubarb, each half a dram; make a Powder: let it be taken in a draught of Poſſet-drink, in a Decoction of Epithimum ſimple four or five ſcruples.*

Take *of the beſt Senna two ounces, of the Roots of Polypodia of the Oak two ounces, of Epithimum one ounce and a half, of yellow Citrons half an ounce, of Tamarinds one ounce, of Coriander ſeeds ſix drams, boil them in Barnet water four pints, till half be conſumed,* *Syrups.*

ſtrain it, and let it be evaporated in a warm Bath, to the conſiſtence of a Syrup, adding towards the end, of pure Manna, and of white Sugar, each four ounces; make a Syrup: the Doſe is two ſpoonfuls or three, in three ounces of ſome convenient diſtilled water, or in any other liquor. Or,

Take *of the ſame liquor evaporated to the conſiſtence of Honey ſix ounces, of freſh Caſſia four ounces, of the jelly of Currans two ounces, of Cream of Tartar, of the Salt of Wormwood, each one dram and a half; of the Powder of Diaſen, two drams, of yellow Sanders powder'd two drams; mix them and make an Electuary: Doſe three drams to half an ounce.*

Altering Medicines are of the greateſt moment;

Purging is not to be uſed continually, nor too frequently, yea it ſuffices that it be adminiſtred within ſix or ſeven days ſpace, and at other times, let the belly be taken down by Clyſters, if it be bound. As to other Medicines, which are not evacuators, though the Ancients relied not much upon them, we put our greateſt confidence of Cure in them. For they (to whom alſo many moderns conſent) thought there was nothing more to be done for the curing of *Melancholy*, than to Purge forth the *Melancholick* humor; wherefore, making Purges their chiefeſt buſineſs, they inſtituted the other Medicines called Preparatory, only for the ſake of this, to wit, making it their ſcope, that as ſoon as the humor being reduced to a fit conſiſtency, by altering Medicines, and that the ways for its excretion were open enough, then that it ſhould be carried forth of doors by Purgers. Which kind of *Hypotheſis* ſeems not agreeable, neither to reaſon, nor to Medical experience; becauſe *Melancholick* people rather receive hurt than help by often Purging, how methodically ſoever it be inſtituted. Therefore, we, placing the cauſe of this Diſeaſe in the Dyſcraſie of the Blood and Spirits, and in the weakneſs or evil conformation of the *Viſcera* and the Brain, eſteem altering and corroborating Medicines to be in the firſt rank for Remedies, and for the ſake of theſe, that Purgers may be uſed ſometimes between whiles. Therefore Purging being rightly preſcribed at due intervals, for the removing impediments, as to the reſt you may proceed according to theſe forms.

and not purging Medicines, as the Antients thought.

An Electuary. Take *of the Conſerves of the flowers of Gilliflowers, and of Borage, each two ounces and a half; of the rinds of Myrobalans preſerved ſix drams, of Coral prepared, and of Pearl, each one dram and a half; of Ivory, and Crabs Eyes, each one dram; of Confection de Hyacintho two drams, of the Syrup of Coral and red Poppy what will ſuffice; make an Electuary: take two drams Morning and Evening, drinking after it three ounces of the following Julep, or the diſtilled Water.*

A Julep. Take *of the water of the Flowers of Cowſlips, and of black Cherries, each ſix ounces; of Balm four ounces, of Dr.* Stephens *his Water two ounces, of Sugar ſix drams; mingle it and make a Julep.*

A Diſtilled Water. Take *of the leaves of Balm, Borrage, Bugloſs, Fumitory, Water-Creſſes, and Brooklime, each four handfuls; of the flowers of Pinks, Marigolds, Borrage, and Cowſlips, each three handfuls; the outer rinds of ſix Oranges and ſix Lemons, being all cut and bruiſed, pour to them Whey made of Cyder eight pints; diſtil it in a common Still, and mix all the liquor together.*

Lozenges. Take *of the Powder of Pearl, of Ivory, of Coral prepared, each two drams; of the Species Lætificant (or making merry) of Diarrhod. Abbatis, each one dram; of the Oyl of the rind of Citrons half a ſcruple, of white Sugar, diſſolved and boiled to the conſiſtence of Lozenges, in what will ſuffice of Balm Water, ſix ounces; make Lozenges according to art, weighing a dram: take two or three at nine of the Clock in the Morning, and at five in the Afternoon, drinking after it a draught of the diſtilled Water or of Tea.* Or,

An Apozem; Take *of the Roots of Chervil, of Polypodium of the Oak, each one ounce and a half; of the leaves of Harts Tongue, Ceterach, Scolopendria, Germander, each one handful; of Tamariſk half a handful, of the bark of the ſame half an ounce, of Raiſins of the Sun ſtoned two ounces, one Apple cut; let them be cut and bruiſed, and boiled in four pints of Spring-water, to the conſumption of a third part; about the end add of the leaves of Water Creſſes one handful, let it be ſtrained and clarified: take of it ſix ounces twice or thrice in a day; ſweeten it with Syrup of Fumitory.*

Spaw-Waters. *Spaw* Waters coming from Iron, are wont oftentimes to give great benefit for the Curing of *Melancholicks*, to wit, becauſe they being plentifully drunk, waſh out *Jalino-ſulphureous* Tincture of the Blood, and deſtroy its evil ferment. Moreover, they wipe clean the filthineſs of the Viſcera, unlock obſtructions, and what is of great benefit, they corroborate, by their aſtriction, both the weak and too looſe *Viſcera*, and alſo ſhut up the little mouths of the gaping Veſſels of the Brain, by which a paſſage lay open

into

into it for the extraneous matter, together with the nervous juice. And for this reason, to wit, by corroborating the Viscera, and by locking up the passages of the Head, *Vitriolicks* prepared of Iron are wont to be given profitably in *Melancholy*, and also in the *Vertigo*.

Chalybeates.

Take *of our Steel prepared three drams, put it into a quart of the Water above described, take of it three or four ounces twice in a day, by it self, or with any other solid Medicine.*

Steeled Medicines.

Take *of the filings of Iron one ounce, put it into a glass with the juice of Oranges two ounces; let it stand for a day, shaking it sometimes, then pour to it of the Water of Pipins, and of White Wine, each one pint; or of the more thin and sweet Cyder one quart: take of it three ounces, twice in a day, after the same manner.*

Take *of the Vitriol of Steel, of the Cream of Tartar, of Crabs Eyes, each one dram; mix them; make a Powder, and let it be divided into nine parts: Take one part every Morning in a draught of the distilled Water, or the Decoction, or in a proper Broth.*

Take *of the Syrup of Steel four ounces: take of it one spoonful twice in a day, in a proper Vehicle.*

Take *of the Extract of Steel, of our Steel prepared with a proper Decoction three drams, of the Powder of Ivory, of yellow Saunders, of Lignum Aloes, each half a dram; of the Salt of Tartar two scruples, of Ammoniacum dissolved in the Water of Worms what will suffice to make a mass; let it be made into small Pills; let three or four be taken every Evening, drinking after it three ounces of the water of Apples, or of Cowslip flowers.*

Whey.

Whey, if it agrees with the stomach, being drunk very plentifully, for many days, for the same reason as Spaw *waters, viz. by washing out the Salt, and Sulphureous particles of the Melancholick blood, is often given with success. Whey with Epithimum infused in it, or boiled in it, is highly praised by some.*

Broths.

Let Broths be made of a boiled Pullet, with the roots of Polypodium, Chervil, Fenil, Buthers Broom, and the leaves of Ceterach, Harts Tongue, Scolopendria, &c. take a draught of it in the Morning, and at five of the Clock in the Afternoon, in which dissolve of the Vitriol of Steel six grains, to ten of the Salt of Wormwood, and of the Cream of Tartar, each a scruple.

Juices of Herbs.

The Juices of Herbs and their expressions bring sometimes notable help to the taking away the Discrasie of the Blood. Take *of the leaves of Borage, of Water-Cresses, each six handfuls; two Apples pared, the Pulp of two Oranges, and of white Sugar one ounce; let them be all bruised together, and pour to them of the best Cyder a pint and an half; make an expression very strongly, and let it be kept in a glass. The Dose is four ounces twice or thrice in a day.*

A Bath.

In the Summer time, a Bath of sweet water, for that it wipes away the filth impacted in the Pores of the skin, and moves transpiration insensibly, is very profitable to some.

Hypnoticks.

Because *Melancholick* persons sleep but badly, and from long and frequent waking become worse, therefore *Anodynes*, and sometimes the more gentle *Hypnoticks* (when there is need) may be prescribed to be taken late at night, for this end are convenient, a Decoction of Cowslip flowers, or of the leaves of Lettice, or the water of red Poppies, or the Syrup of the same: Further, Emulsions of the Seeds of the white Poppy, of the Syrup *de Meconio*, and others that are only agreeable and cherishing of the Spirits.

As there is an infinite Company of *Melancholicks*, as well as of *Fools*, therefore we shall illustrate our *Hypothesis* with two Examples only, in one of which the Disease begins from the sensitive part of the Soul, or the Animal Spirits; and the other from its Vital part, to wit, from the Blood.

The first History.

Sometime since, a noted person about forty years of Age, of a florid countenance, chearful, and nimble about any business, being afflicted in his mind, by reason of a certain affair, and very much dejected, he became thereupon very sad, *Melancholick*, and with a dark and cast down countenance. When I went first to visit him, he complained of a manifold hurry and distraction of thoughts, which were so many, that he was busied in his Phantasie almost night and day continually, he lived without any sleep: Nor were these cares concerning the commonweal, or the proper business of his Family; nor about the health of his Soul, or of his Body, was he at all solicitous; but was rather troubled perpetually about small matters, and of no moment. He was so fearful of all things, that he presaged loss or death immediately to happen to him, upon every small accident. And lastly, he was so sad, as if he would contend in weeping with *Heraclitus*. Further, he laboured with such a straitness of Heart, and so great a constriction, that he seemed to feel all his *Praecordia* to be drawn together like a Purse,

An Example of Melancholy beginning from the Spirits.

and

and he thought that there ſtill lay there an immenſe burthen, and mighty weight, under which he imagined he could not go, unleſs ſtooping towards the Earth. Whilſt he talked, and diſcourſed with his Friends, this conſtriction of the *Præcordia*, and the weight did ſomewhat remit; but then again, they were wont to be repeated more vehemently, ſhaking for fear at any unaccuſtomed object: Nor did he labour only in his *Præcordia*, but with a certain conſtriction in his whole Body beſides, and as if a certain burthen lay on the region of his Loins, and alſo on his ſhoulders and arms.

The Cure. The reaſons of theſe *Symptoms* are clear enough from our *Hypotheſis*. As to the Cure, after various Medicines being given, without any ſucceſs, I at laſt perſwaded, becauſe it was then Summer time, that he ſhould drink of our Artificial *Spaw* Waters, for a fortnight: Therefore, firſt two quarts of Spring-water being poured upon half a dram of our prepared Steel, for a night, and afterwards as much in four quarts of water; the ſick man every morning drunk the clear liquor, and within four or five hours he rendered the greateſt part of it by Urine: He took beſides, going to ſleep and early in the morning, a Doſe of an appropriate *Electuary*, (ſuch as is above deſcribed) with a *Cephalick Julep*; within two months he became much better, and afterwards by degrees returned to himſelf.

The ſecond Hiſtory. An Example of Melancholy ariſing from the Blood. Whilſt I was writing theſe, a young Noble-man, being lately returned from his Travels beyond Sea, and becoming unhealthy, put himſelf upon our care. This perſon being formerly indued with a Sanguine and chearful temperament, ſplendid in his appearance, as alſo with an acute wit, and of a ready ingenuity, whilſt he travelled in the Countries abroad; but one Summer living in *Spain*, he felt a great alteration in himſelf, from the great heats in that place: for firſt of all, from the frequent heatings of his Blood, he became obnoxious to an heat ariſing in the palms of his hands, and in the bottoms of his feet, with prickings over all his body, which in a ſhort time vaniſhed. Then he found him ſelf very bad as to his Appetite and Sleep; moreover being dull and ſad, he began not to mind, yea ſometimes to avoid any pleaſant buſineſs, or the converſe of his Friends. At length his indiſpoſition daily increaſing, without any evident cauſe, or real trouble of mind, he became *Melancholick*, ſo that being ever thoughtful, fearful, and ſad, nothing could delight him; for his ſtudies, exerciſes, travelling, converſation with learned men, or any other thing which he before delighted in, now became to him a trouble and a terror. After this manner being diſtemper'd for two years, he was ſo changed from himſelf, as if he were another Man. For his Cure he had conſulted the moſt skilful Phyſicians in *Spain*, *France*, and *Holland*, and laſtly in *England*, and had tryed ſeveral methods of healing almoſt without any benefit. The *Melancholick* diſtemper of his blood, at firſt contracted by the intemperature of the Air, ſtill remaining, and afforded to the Animal regiment, Spirits as it were acetous, that is ſuch as we but now deſcribed. To this Noble man, at the beginning, we thought good to recommend theſe following Remedies.

The Curatory Method propoſed.

Take *of the Decoction of Senna Gerionis (with Tamarinds half an ounce) four ounces, of the Syrup of purging Apples one ounce, of Aqua Mirabilis two drams; mix them, and take it with government, repeating it within nine days. After Purging let Blood be taken away with Leeches, about four ounces.*

Take *of our Syrup of Steel ſix drams, take a ſpoonful in the morning, and at five of the Clock in the Afternoon, in the following liquor three ounces, walking after it for an hour or two.*

Take *of the leaves of Balm, Borrage, Bugloſs, Pimpernel, Elm-tree, Harts Tongue, Water-Creſſes, each four handfuls; of the Roots of Borrage half a pound, of Pinks and Marigold flowers, each three handfuls; the outer peels of eight Oranges and four Lemons, of Mace half an ounce; theſe being cut and bruiſed, pour to them of Whey made of Cyder eight pints; let them be diſtilled in common Stills.*

Take *of the Conſerves of Gilliflowers, Betony, Borrage, each one ounce and a half; of Pearl powdered two drams, of red Coral prepared one dram and a half, of the Species Confect. de Hyacintho two drams, of the Syrup of Coral, and red Poppies, each, what will ſuffice: make an Opiate to be taken going to ſleep every night, the quantity of a Cheſnut, drinking after it of Cowſlip flower water two or three ounces.*

After ſixteen or twenty days, changing the method of altering Medicines, the following things were uſed in their places.

Take *of the Powder of Ivory, Pearls, red Coral prepared, each two drams; of male Pœony roots one dram and a half, of the Wood-Aloes half a dram, Lozenges made out of Oranges four ounces, of the ſolution of Tragacanth made of Balm Water, what will ſuffice: make Troches weighing half a dram: let him eat four in the Morning, and at five in the Afternoon, drinking after them a draught of Tea.*

Take

Take *of the ſame Powder without the Lozenges half an ounce, of the flowers of Sal Armoniack, and of Salt of Coral, each one dram; with Turpentine of Chio ſix drams, make a Maſs: take half a dram Evening and Morning, drinking after it of the diſtilled water three ounces.*

His food was only good and eaſily digeſted meats: he drank ſmall Ale, with the leaves of Harts-tongue infuſed in it. He taſted ſometimes a little Water and Wine, or Cyder, and he was almoſt continually employed, ſometimes in ſome eaſie affairs, ſometimes in moderate exerciſes, or in ſeveral ſorts of recreations.

Thus much concerning univerſal *Melancholy*, by which the ſick are affected almoſt indifferently by any object, ſo that they are intangled in every place, and by any accidents and circumſtances, with a multitude of thoughts continually, with raving, fear, and ſadneſs. We have largely enough handled the *ſymptoms* of this Diſeaſe being manifold, and the reaſons of them, partly in this Chapter, and partly in another Tract. *Univerſal Melancholy.* De Morbis Convulſivis, Cap. 2.

It is called ſpecial *Melancholy*, when the ſick reſpect a certain particular thing, or ſome kinds of things, of which they think almoſt without ceaſing; and by reaſon all the powers and affections of the ſoul being continually imployed about this one thing, they live ſtill careful and ſad; moreover, they have abſurd and incongruous notions, not only about that object, but alſo concerning many other accidents and ſubjects. In this Diſtemper, the Corporeal Soul, bending from its proper kind, aſſumes a certain new one, but not being conformable, either to the Rational Soul, or to the Body, or to it ſelf, it enters into a certain *Metamorphoſis*. *Particular Melancholy,*

This kind of Diſtemper, is produced by many ways, and on various occaſions; for vehement paſſions, deſire, fear, anger, pleaſure, yea all other paſſions both of the *concupiſcible* and *iraſcible* Appetite, being long continued, and carried forth to the height, are wont to excite the ſame. But there are two general occaſions, from which ſpecial *Melancholy* chiefly and moſt frequently doth ariſe; to wit, firſt, when there lyes a moſt heavy preſſure on the mind of ſome preſent evil, or an evil juſt at hand, whether it be true or imaginary: or ſecondly, if the loſs or privation of ſome good before obtained, or deſparing of ſomething wiſhed for or defired, happen. In theſe oppoſite caſes, the Corporeal Soul being either drawn forth outwardly, omits all domeſtick care, either of it ſelf, or of the Body, or of the Rational Soul: or being preſſed inwardly, it relinquiſhes or perverts the offices of Reaſon, and of both the Vital and Animal Functions. It would be an huge work to enumerate the various caſes in either kind, and their ways of affecting; out of the great plenty, which being of the greateſt moment, ſeem to require the care of a Phyſician, are chiefly *furious Love, Jealouſie, Superſtition, deſpair of Eternal Salvation*, and laſtly the *imaginary Metamorphoſis* of the Body or its parts; and the good and evil phantaſticks of fortune; of theſe, ſeverally, we ſhall ſpeak briefly. *is excited by reaſon of two ſorts of Affections concerning Good or Evil.*

Concerning the power of Love, ſaying nothing here of ſome moſt noble Lord, or Heroick actions, (which appear chiefly on the ſtage of the *Theatre*, and on that of humane life) it is a moſt common obſervation, that if any one being taken with the aſpect and converſation of any Woman, begins to deſire her and to grow mad for her inwardly, and for his moſt devoted affection has nothing but loſs and contempt allotted him, unleſs he be very much ſupported by a firm reaſon, or is averted as it were by other croſs affections, there is great danger leſt he falls into Melancholy, Stupidity, or Love-Madneſs; with which paſſion, if by chance he be diſtemper'd, he forthwith ſeems transformed from himſelf, as it were into an animated ſtatue, he thinks on, nor ſpeaks of any thing but his Love; he endeavours to get into her favour, with the danger of both the loſs of his Life and Fortune; in the mean time, he not only neglects the care of his houſhold affairs, or of the publick, yea his own health, but becoming deſperate of his deſires, he oftentimes lays violent hands of himſelf: But if he be content to live, yet growing lean, or withering away both in Soul and Body, he almoſt puts off man; for the right uſe of reaſon being loſt, omitting food and ſleep, and the neceſſary offices of Nature, he ſets himſelf wholly to ſighing and groaning, and gets a mournful habit and carriage of body. *Love-Madneſs.*

If we ſhould inquire into the reaſon of this Diſtemper, it eaſily appears, that the Corporeal Soul of Man being obnoxious to violent affections, when it is wholly carried into the object moſt dear unto it ſelf, *viz.* the beloved Woman, and cannot obtain and embrace her, there is nothing beſides that can quiet or delight it; yea being refractory, it grows wholly deaf to the Rational Soul, and hears not its dictates, but carrying only tragical notions to the Imagination, darkens the ſight of the intellect. Further, foraſmuch as the *Præcordia* (the more plentiful afflux of the Spirits being *The Reaſons of Symptoms in mad Love.*

ing

ing denyed to them) do ſlacken of their motions, the blood heaped up in the boſoms of the heart, and apt to ſtand ſtill, ſtirs up a great weight and oppreſſion, and for that reaſon, ſighs and groans; in the mean time the face, and the outward members grow pale and languiſh, for that the affluence of the Blood and Spirits is withdrawn: Hence in our *Idiom* or Speech, the Heart of deſpairing Lovers is ſaid to be broken, to wit, becauſe this Muſcle is not lively enough actuated by the Animal Spirit, and ſo is ſhaken weakly and ſlowly, and doth not amply enough caſt forward the blood with vigor, into all parts. Indeed in Love, the Corporeal Soul intimately embracing the *Idea* of its moſt grateful object, endeavours all it can to be joyned, and fully united to the ſame; emitting toward her, the roots of the affections, with which it is moſt ſtrictly enfolded, ſeems from thence to draw its chiefeſt life and growth; ſo that the body being neglected, when as it inclines it ſelf wholly towards the thing beloved, if by chance being broken off from this union, it ſuffer a divorce, like a plant taken out of its natural ſoil, for that it does not receive any more, or aſſimilate food convenient for it ſelf, it ſoon withers: Hence the Animal Spirits leaving their accuſtomed offices, and wonted tracts of expanſion, do not actuate or irradiate either the Brain or the *Præcordia*, nor the nervous *Appendix*, after their due manner: wherefore, not only for the preſent an untrimmed, and a delirious diſpoſition of mind, with a mournful habit of body, are excited; but from thence the vitiated Blood, and the Spirits, having gotten an acetous nature, an habitual *Melancholy* is introduced.

Jealouſie. Such an inordination of the Animal Function as Mad-Love hath, about the acquiſition of its object, the ſame or very like hath *Jealouſie*, about the retention of the ſame, being gotten; ſo always (as well in the fruition as in the deſire) *Res eſt ſollicitæ plena timoris Amor: Love is ever full of careful fear.* This Soul, if it be not ſecure of its moſt dear prey, it preſently grows hot, and pours forth darkneſs and clouds upon its own ſerenity: Then afterwards being infected by a *Cholerick* tincture, it receives every object, as if it were imbued with a yellow colour: for indeed, as the ferment of the ſtomach being too much indued with a ſourneſs, perverts all things that is put into it, into its nature; ſo *Jealouſie* being once ariſen, changes all accidents and circumſtances, into the food of its poiſon; and when the ſenſitive Soul, being as it were bowed inward in this paſſion, becomes not conform to its Body, for that reaſon the *Oeconomy* of the Functions both Animal, Vital, and vegetative being depraved, *Jealouſie* makes one rave, and to wither away.

Superſtition and Deſperation. Superſtition, and a deſpair of *Eternal Salvation*, are wont to impreſs on the *ſenſitive* Soul, the Blood, and the Body, almoſt the like Diſtempers of *Melancholy*, as *Love* and *Jealouſie*; but their way of affecting is ſomewhat different: for in thoſe the object, whoſe acquiſition or loſs is indanger'd, is wholly immaterial, and its affection being at firſt conceived by the Rational Soul, is impreſſed on the other Corporeal: In the proſecution of which, if ſhe eaſily obtains her deſires, then no perturbation of the humane mind ariſes; but if (as it often is wont to happen) the Corporeal Soul being oppugned or refuſed, it will not ſtand to the monitions of the Rational, but preſently growing hot, moves inordinately the Blood and Spirits, oppoſes the Corporeal goods and blandiſhments to the ſpiritual objects, from the intellect, and endeavours to draw the man to its ſide; and ſo whenas there is a continual skirmiſh between the two Souls, and that ſometimes the ſuperior Will, and ſometimes the ſenſitive Appetite prevails; at length the judgment ſeat of the Conſcience is erected by the mind, where every ſeveral action is ſcrupulouſly examined. By reaſon of this more frequent ſtrife of the Souls, the Animal Spirits being too much and almoſt perpetually exerciſed, and often commanded, and as it were drawn hither and thither into contraries, at length they depart ſomething from their vigor and their nature, and at length being made more fixed and Melancholick, for that they are detained from their wonted expanſion, cut unaccuſtomed and by-tracts in the Brain, and ſo induce a *Delirium* or idle raving, with mighty fear and ſadneſs. In this ſort of Diſtempers, the Corporeal ſoul being ſnatched as it were violently, departs both from it ſelf, and from the Body, and according to the characters of the impreſſed *Idea* being modified, it is wont to aſſume a new image, either Angelical or Diabolical; in the mean time, the Intellect, becauſe the *Imagination* furniſhes it only with undecent and monſtrous notions, is wholly perverted from the uſe of right reaſon.

The reaſon of the Symptoms.

The imaginary Metamorphoſis of Melancholick Perſons. By the like means of affecting, it happens that ſome *Melancholick* perſons undergo imaginary *Metamorphoſes*, as to their fortunes, or as to their bodies, *viz.* whilſt one imagines himſelf, and plays the part of a Prince, and another a Beggar; another believes that he has a Body of Glaſs, and another that he is a Dog, or a Wolf,

or

or ſome other Monſter; for after the Corporeal Soul's being diſtemper'd with a-long *Melancholy* and the mind blinded, it wholly departs both from it ſelf, and alſo from the Body, and affects, and as much as in it lyes, truly aſſumes a new image or condition.

CHAP. XII.

Of Madneſs.

Madneſs and Melancholy are akin.

After *Melancholy*, *Madneſs* is next to be treated of, both which are ſo much akin, that theſe Diſtempers often change, and paſs from one into the other; for the *Melancholick* diſpoſition growing worſe, brings on *Fury*; and *Fury* or *Madneſs* growing leſs hot, oftentimes ends in a *Melancholick* diſpoſition. Theſe two, like ſmoke and flame, mutually receive and give place one to another. And indeed, if in *Melancholy* the Brain and Animal Spirits are ſaid to be darkned with fume, and a thick obſcurity; In *Madneſs*, they ſeem to be all as it were of an open burning or flame. But indeed, for that as we have already ſhewn, that the Animal Spirits being inkindled or inflamed do excite a *Phrenſie* with a *Feavour*, which is wanting in *Madneſs*, their affection will be better illuſtrated in this Diſeaſe, as well as in *Melancholy*, by the *Analogy* of *Chymical* Liquors.

The Subject of Madneſs are the Animal Spirits.

The diſpoſition of which are like to Stygian *Water.*

Whenever therefore *Madneſs* without a *Feavour* being excited, with a remarkable hurt of the animal Function, is wont to be permanent, and continue long, its next and immediate ſubject are the Animal Spirits; which acting not by conſent, nor from any force from another, but of themſelves, are habitually diſtemper'd, and depart from their proper and genuine nature, to wit, a *Spiritual ſaline*, into a *Sulphureous-ſaline* diſpoſition, like to *Stygian*-Water, as we have ſhewed above; therefore they perform only inordinate acts, and ſo perſiſt a long while to act amiſs or evilly. To this vice of theirs, perhaps the Brain, or the Blood, or other parts may contribute ſomewhat, but the Spirits themſelves are firſt and chiefly in fault.

Three chief Accidents in Madneſs.

It is obſerved in *Mad men*, that theſe three things are almoſt common to all: *viz.* Firſt, That their *Phantaſies* or Imaginations are perpetually buſied with a ſtorm of impetuous thoughts, ſo that night and day they are muttering to themſelves various things, or declare them by crying out, or by bauling out aloud. Secondly, That their notions or conceptions are either incongruous, or repreſented to them under a falſe or erroneous image. Thirdly, To their *Delirium* is moſt often joyned Audaciouſneſs and Fury, contrary to *Melancholicks*, who are always infected with Fear and Sadneſs. Theſe primary *ſymptoms* of *Madneſs* in the Animal Spirits, indued with the nature of *Stygian*-Water, may be thence moſt aptly deduced as appears clearly by what follows.

Which are alſo to be found in Stygian Water.

1. The Particles of this are always in motion.

For firſt, the Particles of *Stygian*-Water are highly active and unquiet, and in perpetual motion; hence the Effluvia's falling from them continually ſtrike the Noſtrils, and the Liquor being poured forth from the Veſſel, meeting with ſome other bodies grows very hot, and penetrates their Pores and Paſſages; the reaſon of which is, becauſe the *Saline* Particles being conjoyned with the *Sulphureous*, ſhake one another, and will not cohere with any of another kind. In like manner we may ſuppoſe that the Animal Spirits being ſtilled forth from the Blood; filled as it were with a *Nitrous ſulphur*, are indued with a notable mobility or unquietneſs; which, for that reaſon, being ſtretched forth from the middle of the Brain on every ſide, both in its compaſs and in the nervous *Syſtem*, and being from thence perpetually reflected, produce unbridled *Phantaſies*, and almoſt never interrupted, and alſo great and perpetual inordinations, both of the ſenſitive and loco-motive function.

And in like manner the Animal Spirits in Mad-men.

2. The Effluvia's of Stygian water, every where make new Pores and Paſſages.

In like manner alſo the Animal Spirits in Mad men.

Secondly, the *Effluvia's* exhaling from *Nitrous* or *Stygian* Spirits, do not ſo much evaporate from open ſpaces, but being very penetrating, cut every where new ones, almoſt in every ſubject, where they are able to break thorow; yea moſt bodies containing theſe kind of Spirits, or the things laid upon the mouths of the Veſſels, are ſo bored thorow by them, that they are preſently rendred friable or brittle, and fall into ſmall bits. In like manner we believe, that the Animal Spirits in the Diſtemper of *Madneſs*, becoming very moveable, and very much ſharpned, out of their morbid nature, do ſo likewiſe leave their former tracts of going and returning to and fro, and do cut for themſelves, every where in the Brain, new little ſpaces or walks,

and plainly devious; in which, whilſt they flow, they produce unaccuſtomed notions, and very abſurd, whence there is a neceſſity, that the diſtemper'd do ſpeak, and imagine for the moſt part incongruous and diſcompoſed things; at once confounding things paſt with things preſent, or to come; and contrary or oppoſite things.

3. The Effluvia's of Stygian water are diffuſed far.

Thirdly, It is obſerved, that the vaporous little bodies falling away from the *Nitro-ſulphureous* Spirits of Minerals, do not only ſubſiſt in the neighbourhood, (as the breath exhaling from *acetous* Liquors) but are diffuſed very far, and on every ſide into remote places. I have often-ſeen, when the Spirit of *Nitre* has been mixed with the Butter of *Antimony*, that the whole Chamber has been filled with a black ſmoke aſcending from thoſe *Stygian* Liquors: When *Aqua fortis* or the Spirit of *Nitre* being poured from the *Alembick*, or drawn forth by a gentle heat, a moſt ſharp vapor has pierced the Noſtrils and Lungs of thoſe ſtanding afar off; which certainly happens by reaſon of joyning together of the fluid *Salt*, and the raging *Sulphur*; the little bodies of either of which mutually incite one another, and ſo being combined together, are carried farther. Indeed, after the ſame manner it ſeems to be concerning the Animal Spirits in *Mad-men*, which, for that they are of the ſame nature as *Stygian* Water, quickly paſſing thorow both the frame of the Brain and its *Appendix*, cauſe the diſtemper'd not only to be furious, but as it were *Demoniacks* or poſſeſſed with the Devil; ſo that being free from any fear or languiſhing, they enter upon any thing boldly, and expoſe themſelves fearleſs to ſword or fire; alſo by reaſon of the prodigious putting forth of their Spirits, with a mighty ſtrength, they often break aſunder bonds and chains, and overthrow at once many ſtrong men, reſiſting and going about to reſtrain them.

In like manner as the Animal Spirits in Mad-men.

What the Conjunct Cauſe of Madneſs is.

The comparing of the Animal Spirits with *Stygian* Water, or the *Nitro ſulphureous* Spirit, clearly ſhews what is the conjunct or immediate cauſe of *Madneſs*; to wit, which ſeems to conſiſt, not ſo much in an aduſt bile or humor, or black and ſharp vapour, being ſuddenly ſuffuſed into the Brain, and inciting the Spirits inhabiting it into rage and fury; (for ſuch a vapour or humor either exhales of its own accord, or may be ſoon removed by the help of Remedies; and ſo the madneſs thence excited, would paſs away as quickly and as eaſily as the Fury or *Delirium* produced by the eating of wild Parſnips) but rather raging *Mad-men* are habitually ſo made, becauſe their Animal Spirits degenerate from a gentle and benigne nature, as alſo a ſubtil and very active diſpoſition, to wit, a *Spirituous-ſaline*, into another more ſharp, to wit, partaking of a fluid *Salt*, an *Arſenical Sulphur*.

How the Animal Spirits acquire a diſpoſition like to Stygian Water.

As to what belongs to the more remote or antecedent cauſes of *Madneſs*, *viz.* by reaſon of which the Animal Spirits acquire a moſt ſharp diſpoſition; before we come to theſe, we ought to ſhew how, and by what reaſon or means, a certain Corroſive *Latex* or water (ſuch as we ſuppoſe the Animal Spirits with its Vehicle to be) is begotten, and is able to ſubſiſt in the humane body.

It is ſhewed in the firſt place that corroſive and as it were Stygian Particles, are begot in the humane Body.

Truly, that moſt ſharp humors are ſometimes begotten in our bodies, plainly appears by many obſervations. We have elſewhere made mention of a Noble Man, grievouſly obnoxious to diſtempers of the Brain and Nerves, whoſe ſweat (when he was in a fit) preſently eat thorow his ſhirt, or made it ſo crumbling or friable, as if it had been dipt in *Aqua fortis*. It is an uſual thing for ſome to render by Vomit oftentimes as it were a *Vitriolick* water, corroding the coats of the *Oeſophagus* and the Palat. Further, *Cancrous*, *Scrophulous*, and *Peſtilential* Ulcers, ſhew a moſt ſharp humor, by which the fleſh and Membranes are eaten, as it were with *Aqua fortis*, with a blackneſs poured on them. Further it is obſerved, that Corroſive *Stagmas*, not chiefly brought forth in the Blood, are affixed to the muſculous fleſh, or to the *Parenchyma* of the *Viſcera*; but more frequently being procreated in the nervous liquor, being laid up with its *Latex* in the nervous parts, or their *Emunctories*, do produce *Apoſthums*, and *Pockey*, *Septick*, and other foul and filthy Ulcers. For theſe are moſt often excited in the *Glandulas*, or near the Tendons, or Membranes; and when as the humor falling away from them is firſt thin and watry, and afterwards becomes black very ſtinking, and corroſive; it is a ſign indeed, that the nervous Liquor it ſelf is changed into that ſort of putrefaction.

Wherefore the Nervous Liquor oftentimes becomes corroſive. Becauſe the volatile Salt moſt eaſily degenerates into an acid and moſt ſharp, with the acquired Sulphur.

It eaſily occurs, if the reaſon of theſe be inquired into, that the *Latex* watering the Brain and nervous *Appendix*, doth contain in it ſelf, together with a ſubtil Spirit, great plenty of volatile Salt. Therefore, when this is ſo depraved, that the Spirit being depreſſed, the Saline Particles degenerate into a flux, and acquire to themſelves little *Sulphureous* bodies, it becomes plainly Corroſive and *Stygian*. Wherefore, malignant humors and Ulcers chiefly happen in the nervons parts, and their *Emunctories*, and there are excited upon any light occaſion (as when a ſmall hurt happens to the Breaſt of a Woman, a *Cancer* follows) becauſe, indeed, the nervous humor being hindred ſomewhere in its paſſage, doth there ſtagnate, preſently the Spirit being depreſſed,

depreſſed, or flying away, the Saline Particles degenerating from a volatile to a ſour nature, get to themſelves ſoon after ſtrange companions, and ſnatching either Earthy or Sulphureous little bodies, or of ſome other kind, begin to congeal into *Scirrhous*, *Strumous*, or *Cancrous* Tumors. And when after this manner, by the ſtagnating of the nervous Liquor, and by its getting an heterogeneous concretion, the Mine of a Tumor is blown up in ſome part, and the ſupplements of the ſame liquor are continually perverted into the like nature of viciouſneſs; to which alſo happen, the *Melancholick* impurities, poured forth from the Blood, and other humors, which with their joined forces encreaſe the rage (even as when diverſe Salts and Sulphurs are deſtilled together) and conſtitute in the diſtemper'd part, a *Septick* matter, and like to the *Eſcharotick* or cruſting up of *Stygian* Water. According to this reaſoning or *Ætiology*, the irregularities of theſe kind of Tumors, as alſo the appearance of the Kings-Evil, are moſt aptly unfolded. If that the nervous Liquor ſo corroſive, and made degenerate, doth not grow into Tumors, flowing into the nervous Fibres, it is wont to cauſe here and there moſt cruel Pains and Cramps.

Hence the Reaſons of Tumours and Ulcers in the Kings Evil and the Cancer, are given.

But as this Liquor of the Nerves, being depraved after this manner, ſtirs up the aforeſaid Diſtempers in the nervous parts; ſo it is not difficult to conceive, that the ſame water, for that it is for a Vehicle of the Animal Spirits, flowing in the Brain, doth acquire, together with thoſe Spirits, a Corroſive and as it were a *Stygian* nature, and for that reaſon excites Madneſs. The depravation of the Animal Spirits, together with the juice watering the Brain, or the diſpoſition of Madneſs, is wont to ariſe after various ways and for diverſe cauſes; but truly, for the moſt part this Diſtemper (as we have obſerved of *Melancholy*) begins either from the Spirits themſelves, or elſe from the Blood.

Hence alſo the Madneſs of the diſtempered Spirits.

The Original of Madneſs either from the Spirits themſelves, or from the Blood.

Firſt, *Madneſs* beginning from the Spirits, ariſes ſometimes from an evident ſolitary cauſe, as a violent Paſſion; ſometimes alſo it proceeds from a foregoing cauſe lying in the Brain, as when it comes upon *Melancholy* or a *Phrenſie*. We ſhall a little weigh the reaſons of either caſe, and the various manner of their being made.

It begins for two occaſions from the Spirits.

1. As to the former, when a vehement affection puts any one beſides himſelf, that happens to be made thus; either becauſe the Animal Spirits are too much overthrown, and hurried into confuſion; or becauſe they are elevated above meaſure, and endeavour to ſtretch themſelves forth beyond their ſphere.

1. *By Reaſon of a violent Paſſion, by which*

Firſt, The Spirits are wont to be caſt down by a violent and terrible Paſſion; ſo it often happens, that ſome being ſtruck with a panick fear, by ſeeing a true or an imaginary Spectre or Ghoſt, afterwards fall into a perpetual Madneſs. Further, ſome by reaſon of ſome notable diſgrace or repulſe, others by reaſon of their hopes of obtaining their Love being ſuddenly and unthought of fruſtrated, and others by reaſon of a raſh breaking their oaths or vows, and violated Conſcience, being firſt highly troubled in mind, anon become Mad. The reaſon of which is, becauſe the Animal Spirits being driven beyond their orders and wonted paſſages, and put into confuſion, do make for themſelves new and devious ways, which entring into, immediately they bring forth delirious *Phantaſms*; in the mean time, the *Saline* Particles of the nervous juice, the ſpirituous being depreſſed, depart from their volatileneſs; and ſuffering a flux, aſſume to themſelves the *Sulphureous* little bodies poured forth from the Blood, into the then weak and open Brain; From whence this Liquor, being moſt ſharp like *Stygian* Water, and the Animal Spirits becoming fierce and very much incited, become furious.

They are either too much caſt down,

Secondly, Sometimes the Animal Spirits, whilſt they are too much elevated, almoſt after the ſame manner induce both to themſelves, and the nervous juice, the mad diſpoſition. Hence Ambition, Pride, and Emulation, have made ſome mad; the reaſon of which is, becauſe whilſt the Corporeal Soul ſwelling up with an opinion and pride of its own excellency, lifts up it ſelf, and endeavours on every ſide to expand or ſtretch it ſelf forth moſt amply, beyond the border or ſphere of its body, the Animal Spirits being tumultuarily called into the Head, will not be contained within their wonted bounds, but being there broken and diverſly reflected, by reaſon of their too much excretion, are compelled into new and plainly devious tracts; wherefore, both they being thruſt forth from the courſe of their proper emanation, and alſo the nervous Liquor, do quickly acquire a ſharp and incitative Diſpoſition, as was ſaid but now, for that reaſon *Madneſs* follows.

Or elevated above meaſure.

Thus much concerning Madneſs, excited by reaſon of a ſolitary evident cauſe; but this Diſeaſe doth alſo ariſe from a *Procatartick* cauſe, preexiſting in the Brain, andchiefly from *Melancholy* or the *Phrenſie* going before; in that the Animal Spirits with the nervous juice being a little more exalted, and in this a little more depreſſed, acquire the diſpoſition of Madneſs. As to the former, it is a vulgar obſervation, that ſudden and great *Melancholy* is for the moſt part next to Madneſs: the reaſon of which is, becauſe, when the

2. *Madneſs beginning from the Spirits ſucceeds Melancholy, or the Phrenſie.*

Animal Spirits, together with the nervous liquor, degenerate into a ſoulneſs, are perverted, there only wants the acceſſion of *Sulphur*, by which they afterwards getting a *Stygian* nature; may induce *Madneſs*; (as when an acid Liquor diſtilled out of *Vitriol* or Salt, by the addition of *Sal Nitroſus*, becomes *Aqua fortis*) but indeed, in a great paſſion of *Melancholy*, becauſe the Spirits being diſturbed, the paſſages of the Brain are too open, the *Sulphureous* Particles carried from the Bilous and Rancid Blood, find an eaſie entrance, and ſo the former ſour or acid diſpoſition, turns into a *Stygian* or Maddiſh. Hence it is obſerved, if any one of a more hot temperament, falls into a *Melancholick Delirium*, with fear and ſadneſs, foraſmuch as the *Sulphureous* Particles in its humors, are joyned to the Salts being depreſſed into a flux, that ſadneſs and thinking at the beginning, very readily a ſhort time after becomes madneſs. Secondly, for that alſo a *Phrenſie* often ends in *Madneſs*, the reaſon is almoſt the ſame with the former, but inverted; to wit, becauſe in a *Phrenſie* the Spirits and the nervous Liquor becoming *Sulphureous*, and too much inflamed, afterwards burning forth, get to themſelves *Saline* Particles, and ſo in like matter get a moſt ſharp and as it were a *Stygian* nature; wherefore the *Feavour* then ceaſing, the *Fury* becomes fixed and continual.

1. By what means it comes upon Melancholy.

2. How upon a Phrenſie.

2. The Original of Madneſs ſometimes from the Blood.

2. The diſpoſition of *Madneſs*, hath no leſs frequently its roots in the bloody Maſs, and is at length produced into act, to wit, when as the Blood being depraved, and becomes *Nitro-ſulphureous*, it either perverts the nervous Liquor, as alſo the Animal Spirits, or ſupplies them but evilly. Which kind of taint of the Blood is either hereditary or acquired.

1. It is either Hereditary.

Firſt, It is a common obſervation, that men born of Parents that uſe ſometimes to be mad, are obnoxious to the ſame diſeaſe, and though they have lived above thirty or forty years prudent and ſober; yet afterwards without any occaſion or evident cauſe, they have fallen into Madneſs. The reaſon of which is, for that the Blood at that time bending from its due temper, by degrees into a *Nitro ſulphureous*, affords to the Head Animal Spirits, and alſo the nervous juice, participating (as hath been ſaid) of a moſt ſharp nature. We have formerly ſhewn, that in our Complexion, Elementary Particles do perſiſt during life, apart from the ſecondary, afforded by nutrition, and have their times of crudity, maturity, and defection; wherefore we ſuppoſe, the morbid ſeeds do ripen into fruit, according to the periods of Ages. Further, we take notice, that oftentimes the fruits of Diſeaſes of this kind, do remain ripening for a long time, or perpetually as long as life; yet ſometimes falling off as it were of their own accord, do wither away; then ſometimes in another tract of time, from the infection being left, new fruits do ſpring up, and by little and little riſe up to their height. Wherefore, *Hereditary Madneſs* is ſometimes continual, and ſometimes intermitting; Its fits are wont ſometimes to come again after a ſhorter time, and ſometimes after a longer interval.

The Reaſon of which is ſhewn.

2. Or acquired, and ſo either,

Secondly, As the foregoing Cauſe of *Madneſs* ſticking in the Blood, is oftentimes innate or original, ſo ſometimes the ſame is by degrees begotten, either by an evil manner of diet, or by the ſuppreſſion of uſual evacuations, or by reaſon of a Feavour going before, or for ſome other cauſes, and at length being brought to maturity, breaks forth into *Madneſs*. It is an uſual thing in great want of ſuſtenance, that ſome poor people, being conſtrained to feed only on very diſagreeing meats, and of ill digeſtion, become at firſt ſad, with an horrid aſpect, louring and dark, and a little after Mad. The *Hemorrhoids*, and the after flowings of Women in Child-bed, being reſtrained in their flux, or ſome evil and foul running Ulcers being ſuppreſſed, diſpoſe ſome towards this Diſeaſe. Further, thoſe who originally, or by acquiſition, are indued with a more ſharp temper, and with fierce manners, and threatning countenance, by reaſon of the diſpoſition of their Blood, being nigh to a *Nitro-ſulphur*, are in danger to fall into Madneſs, from ſome ſtrong evident cauſe.

By reaſon of errours in the ſix Non-naturals;

Or by reaſon of Poyſons.

Thirdly, Venomous Ferments being inſinuated to the Blood and nervous juice, as firſt of all from the biting of mad Animals, or by the taking of ſome poiſons, are wont to ſtir up Madneſs. Concerning the reaſons of the former, we have propoſed our conjectures in another place. Of late a very Noble Lady, and to be credited, told me from her own knowledge, that a certain Gentleman, having eaten at dinner time the tender leaves of Wolfs-bane, in a Sallad with other herbs, in the Evening found himſelf ill, and complaining of a great unquietneſs and agitation of his Blood and Spirits, he deſired his Friends to ſend for a Chirurgeon to let him blood, or that otherwiſe he ſhould grow Mad; which indeed, as he ſaid, came to paſs; for before he could be let blood, he fell into Madneſs, and dyed in a nights ſpace: This kind of deadly Diſtemper ſo ſuddenly happened, for that this poiſon had not only perverted the Blood and Animal Spirits, as to their temper, but had ſlain or beat them down immediately, with its malignant Ferment.

An Hiſtory of a Mortal Madneſs, from eating the leaves of Wolfs Bane.

Thus

Thus much for the formal Reaſon, and Cauſes of *Madneſs*. The *primary Symptoms* of it, we have mentioned to be a *Delirium* and a *Fury*; the reaſons of which appear clear enough from what has been already ſaid. To theſe we may moreover add Boldneſs, Strength, and that they are ſtill unwearied with any labours, and ſuffer pains unhurt, of which we will ſpeak briefly. *The Reaſons of the ſymptoms of Madneſs explained.*

Mad-men are not as *Melancholicks*, ſad and fearful, but audacious and very confident, ſo that they ſhun almoſt no dangers, and attempt all the moſt difficult things that are. The reaſon of which is, becauſe the Animal Spirits being very fierce and provoked, both fortifie the Imagination, that no object may ſeem greater or bigger than it is wont to be, and actuate alſo the *Præcordia* with vigor, ſo that they caſt forth the Blood ſtrongly and ſwiftly, and drive it forwards lively to the utmoſt borders of the Body. In this Diſtemper the Soul endeavours to be carried forth, and to leap beyond the compaſs or ſphere of the Body, and ſo ſtriving on every ſide, againſt the incurſions of any exterior things, bears it ſelf without fear. 1. *Wherefore Mad-men are audacious.*

Secondly, *Mad-men* are ſtill ſtrong and robuſt to a prodigy, ſo that they can break cords and chains, break down doors or walls, one eaſily overthrows many endeavouring to hold him. The certain cauſe of which is, becauſe in the Blood and nervous juice of Mad people, are contained Particles as it were *Nitro ſulphureous*, or otherways moſt ſharp, and as it were *Stygian*; from whence the Animal Spirits are indued, or are ſtrong with an *Elaſtick* or *Exploſive* force, ſtupendous, great, and far beyond what's natural. 2. *From whence their immenſe ſtrength.*

Thirdly it is obſerved, that *Mad men* are almoſt never tired; for although by playing mad pranks, and ſtriving many days and nights they ſtrongly exerciſe their members, and live in the mean time without ſleep or eating, yet they ſcarce languiſh at all, nor deſiſt from their agonies for want of ſtrength. Which without doubt comes to paſs, for that the Animal Spirits, though very moveable and *Elaſtick*, are not however volatile and eaſily diſſipable, but by reaſon of the *Saline* Particles being depreſſed from their volatileneſs into a flux, being joined with the *Sulphureous*, become firm and more fixed; and therefore continue longer in their activity. In like manner as we have obſerved in *Aqua fortis*, which though it be contained in a veſſel that's open, perpetually ſends forth very many Effluvia's, and yet ſtill retains its ſubſtance unwaſted, and its corroſive force, otherwiſe than the ſpirit of Wine or Blood, the virtue of which ſoon evaporates. 3. *Wherefore they are never tired.*

In the fourth place, almoſt for the ſame reaſon, *Mad-men*, what ever they bear or ſuffer are not hurt; but they bear cold, heat, watching, faſting, ſtrokes, and wounds, without any ſenſible hurt; to wit, becauſe the ſpirits being ſtrong and fixed, are neither daunted nor fly away. Further, the blood having gotten a *Nitro ſulphureous Dyſcraſie*, is incapable of any other ſudden mutation; wherefore, although inſenſible tranſpiration be hindred, and other uſual evacuations ſuppreſſed, or the ſupplies of the nouriſhing juice degenerated, yet neither a *Catarrh*, nor *Feavour*, nor *Atrophy*, or *evil digeſtion* eaſily comes upon *Madneſs*. For in this Diſtemper, although the Particles of the Blood do greatly ſwell up, yet by reaſon of the abundance of Salt they do not conceive a Feavouriſh burning. Even as alſo *Aqua fortis*, though it grows very hot and burns other ſubjects, yet it ſelf is not at all inflamed, but rather reſiſts burning. 4. *Wherefore they are not eaſily hurt.*

The differences of this Diſeaſe are eaſily gathered from what hath been before ſaid; for firſt as to its beginning, it is either *occaſional*, which ſometimes quickly ceaſes, the evident cauſe being taken away preſently; or *habitual*, depending upon a foregoing cauſe lying in the Blood, and that either *hereditary*, or *acquired*. *The Differences,* 1. *In reſpect of the Original.*

Secondly, by reaſon of the *magnitude*, *Madneſs* is either highly furious, that the diſtemper'd ought to be bound or lock'd up, leſt they ſhould attempt any miſchief to themſelves or others; or elſe it is more gentle, in which the ſick, being converſant with others, abſtain from any malice or hurt. Thirdly, in reſpect of time, *Madneſs* is wont to be long or ſhort, continual or intermitting. Fourthly, As to the various kinds of *Deliriums*, the ſhapes or *types* of this Diſeaſe are almoſt innumerable; all which to run thorow, is neither poſſible, nor worth the while; but moſt commonly, the diſtemper'd are mad alike in all things, or elſe chiefly as to one particular thing, having their judgment concerning other matters for the moſt part right. 2. *By reaſon of the Magnitude.* 3. *In reſpect of Time.*

As to the *Prognoſtick* of *Madneſs*, if the diſtemper'd be not obnoxious to a *Feavour*, nor any other Diſeaſes beſides, nor eaſily hurt by external accidents the Diſeaſe is not mortal of it ſelf; yet the Cure is very difficult, becauſe there is made a great alteration in the Blood and Spirits, and the ſick reſiſt every method of healing, and are enemies to *Phyſicians* and to themſelves. *The Prognoſtick.*

If *Madneſs* be inveterate or hereditary, or is cauſed by the biting of a Mad-Dog, it

is

is hardly or not at all to be cured. What is excited upon ſome occaſion, or from a ſolitary evident cauſe, or ſucceeds a Feavour, alſo upon which comes a Mangineſs, Whelks, the *Hæmorrhoids*, or ſpots in the skin, is eaſily cured.

Thoſe who are obnoxious to this Diſeaſe at intervals, about *Midſummer*, or when the Dog Star ariſes, are in greateſt danger; alſo thoſe who are altered according to the changes of the Air, or when long cold and foul weather are oppoſite in the conſtitution of the Heaven.

The Cure. As there are two kinds of *Madneſs*, to wit, Continual, and Intermitting; ſo the means of healing ought to be twofold.

What the indications are of continual Madneſs. 1. The *Curatory* method to be adminiſter'd, as to continual *Madneſs*, ſuggeſts the commonly noted three primary Indications, *viz.* The firſt *Curatory*, which reſpecting the Diſeaſe it ſelf, endeavours to correct or allay the furies and exorbitances of the Animal Spirits. Secondly, *Preſervatory*, which being levelled againſt the cauſes of the Diſeaſe, endeavours to take away or amend the ſharp and *Nitro-ſulphureous Dyſcraſies* of the nervous Juice and the Blood, as alſo the *Stygian* diſpoſition of the Spirits. Thirdly, *Vital*, which directs ſuch a means of dyet and reſtraint, which is only fit in this Diſeaſe, for the nutritive and vital function to have and be ſuſtained with.

1. The Curatory Indication. The firſt Indication, *viz. Curatory*, requires threatnings, bonds, or ſtrokes, as well as *Phyſick*. For the *Mad-man* being placed in a Houſe convenient for the buſineſs,

As to Diſcipline. muſt be ſo hand'ed both by the *Phyſician*, and alſo by the Servants that are prudent, that he may be in ſome manner kept in, either by warnings, chiding, or puniſhments inflicted on him, to his duty, or his behaviour, or manners. And indeed for the curing of Mad people, there is nothing more effectual or neceſſary than their reverence or ſtanding in awe of ſuch as they think their Tormentors. For by this means, the Corporeal Soul being in ſome meaſure depreſſed and reſtrained, is compell'd to remit its pride and fierceneſs; and ſo afterwards by degrees grows more mild, and returns in order: Wherefore, Furious Mad-men are ſooner, and more certainly cured by puniſhments, and hard uſage, in a ſtrait room, than by *Phyſick* or Medicines.

As to Medicine. But yet a courſe of *Phyſick* ought to be inſtituted beſides, which may ſuppreſs or caſt down the Elation of the Corporeal Soul. Wherefore in this Diſeaſe, Blood-letting, Vomits, or very ſtrong Purges, and boldly and raſhly given, are moſt often convenient; which indeed appears manifeſt, becauſe *Emperick*s only with this kind of *Phyſick*, together with a more ſevere government and diſcipline do not ſeldom moſt happily cure Mad folks. But indeed, this more ſharp handling is not convenient for all Mad people, but to the moſt furious. Others more remiſsly Mad, are healed often with Flatteries, and with more gentle Phyſick.

Phlebotomy. In moſt Mad folks the taking away of Blood copiouſly ought to be in the beginning of the Diſeaſe, as it is the common practice and vogue of the people. And indeed, while there is ſtrength, the opening a vein ought to be repeated, ſometimes in the Arm, ſometimes in the Neck Vein, Forehead, or Foot; and ſometimes it is expedient for the *Hemorrhoidal* Veſſels to be opened by Leeches; for theſe evacuations being timely made, both the raging of the Spirits and the lifting up of the Soul, are beſt of all ſuppreſſed; then beſides the *Dyſcraſies* or evil habits of the Blood (for that what was ſharp and Corroſive in it being drawn forth, a new and gentler comes in its place) are amended.

Vomiting Medicines. That Vomiting Medicines are highly profitable for the curing of Mad people, it is almoſt a Proverb, ſo that the moſt part of *Hellebore*, yea almoſt all *Anticyra* is allotted to them. By what means *Emeticks* do often help in *Cephalick* Diſeaſes, we have ſhown already. *Quack-ſalvers* in this caſe, give with ſucceſs many times, though raſhly and with danger, a large Doſe of *Stibium*: But *Chymical* things are here more convenient, both becauſe they move more ſtrongly, and becauſe alſo the ſick may be more eaſily deceived by them.

Take *of the Sulphur of Antimony eight grains to ten, of the Cream of Tartar half a ſcruples; mix them together by pounding them; make a Powder; let it be given in a ſpoonful of grewel*; or if it be to be given deceitfully, to one not knowing of it, let it be put into a bit of white Bread, and ſo let it be taken in Milk or Broth. Let this Vomiting Medicine be often repeated, to wit, once in four days.

Take *ſix or ſeven grains of Mercurius Vitæ; let a Powder be made, and given after the ſame manner.* The *Emetick Tartar* of *Mynſicht*, and of *Hercules Bovius*, and other various preparations of *Mercury* may be given after the ſame manner. *Aurum vitæ* or the *Solar* Precipitate, alſo the *Lunar* Precipitate, are eſteemed by *Chymiſts* for ſpecifick Remedies againſt madneſs; and indeed, *Mercurial* Medicines, for that they operate not only by Vomit and Stool, but oftentimes by Sweat, Urine, or Salivation, do notably help. A long and plentiful ſpitting or flux at the mouth hath perfectly cured ſome Mad people.

3. The

3. The more ſtrong Purging Medicines, (where ſtrength and the conſtitution may bear them) becauſe they depreſs the raging of the Spirits, and of the Blood, and very much evacuate the *Emunctories*, that are for the receiving the recrements of the Blood, and nervous Juice, do often bring help in this Diſeaſe. For this uſe preparations of black *Hellebore*, as chiefly its extract, and Wine of the Infuſion of its ſtrings, or the pulp of an Apple with the roots of it boiled together are much praiſed. *Purging Medicines.*

Take *of the Extract of black Hellebore, of Calamelanos of each one ſcruple: make a Bolus.*

Take *Calamelanos one ſcruple, of Diagridium from twelve to fifteen grains; make a Powder.*

Take *of Confectio Hamech, or of the Electuary of the juice of Roſes half an ounce to ſix drams: let it be given in broth.*

Take *of the Decoction of Senna Gereonis, or of Epithimum (with the roots of black Hellebore two drams) ſix ounces; make a draught.*

Take *of the Powder of Diaſenna two drams: let it be taken in Poſſet-drink.*

In the mean time, whilſt theſe things are doing, let the Preſervatory Indication reſpect the cauſe of this Diſeaſe. Wherefore, with theſe frequent purgings and letting of Blood, between whiles let altering Medicines or Remedies be uſed, which may attemper the Blood and nervous juice, and reduce them to their due temper; if that the ſick be tractable and orderly enough, they will not refuſe to take ſuch things methodically. *The preſervatory Indication. Altering Medicines.*

Take *of Cryſtal Mineral, or of the beſt purified Nitre two ounces, of Pearls powdered two drams, of Sugar Candy two drams and a half, of Camphor half a ſcruple; let them be all beaten together to a moiſt fine Powder: let two drams of this be put into a glaſs veſſel that will hold two quarts of Spring-water, or of clear ſmall Ale, or Beer and mild; let it be given for ordinary drink at pleaſure.*

Put to *Whey* being made hot the flowers of *Violets* or *Water-Lilies*, and after they have infuſed for two hours, let them drink it plentifully; alſo the *Spaw* Waters are convenient for Mad people to drink orderly, and plentifully. *Whey.*

Take *of the tops of green and the tendereſt Borrage, and Bugloſs, each four handfuls; three Apples pared, of Sal Prunella two drams, of Sugar half an ounce; let them be bruiſed together, and pour to them of Spring-water three pints; make a ſtrong Expreſſion: take half a pint thrice in a day or oftner.* *An Expreſſion.*

Take *of the Conſerves of Borrage flowers, and of Violets, each three drams; Confectio de Hyacintho, of Alchermis, each two drams; of Coral prepared a dram and an half, of the Powder of Pearls one dram, of the Salt of Coral one dram, of the Syrup of red Poppies what will ſuffice; make an Electuary, of which take two drams twice or thrice in a day, drinking after it of the following liquor four ounces.* *An Electuary.*

Take *of the waters of the flowers of the Water-Lilie, Borrage, Bugloſs, and of black Cherries, each four ounces; of red Poppies ſix ounces, of red Roſe-water two ounces, of Camphor tyed in a rag and hang'd in the glaſs half a dram, of the Syrup of Coral one ounce and a half; mix them and make a Julep.* *A Julep.*

Take *of the yellow flowers of the Willow-tree what will ſuffice, let them be diſtilled in a common Still, and let the Diſtillation be repeated, by putting to it freſh flowers for three times: Give of it four ounces twice or thrice in a day, ſweetning it with the Syrup of Water-Lilies.* *Diſtilled Waters.*

Take *of the leaves of the Willow, Meadowſweet, Pimpernel, Borrage, Balm, each ſix handfuls; of the flowers of the Water-Lilie, of the tops of St. Johns-wort, each four handfuls; of Camphor powdered three drams, all being bruiſed together, pour to them eight pints of new Milk; let them be diſtilled in common Stills.*

Let the brains of Weathers be diſtilled with Milk, and give of the water three or four ounces thrice in a day.

Further there are to be uſed Specifick Remedies, ſo called, of which is famous, a Decoction of *Pimpernel* with the purple flower, alſo the tops of *Hypericon* or St. *Johns-wort*, and other Decoctions, Opiates, and Powders of *Antilyſſa* are frequently noted among all the famous *Empericks*. *Specifick.*

Concerning the cure of *Madneſs*, excited from the biting of venomous or mad Animals, for that it is almoſt only *Emperical*, and commonly known, we ſhall not diſcourſe of it in this place, and ſince we have elſewhere propoſed our conjectures concerning it. But a Decoction or an Infuſion of Apples, either raw or boil'd in Spring-water, the liquor *A Decoction and Infuſion of Apples.*

quor of *Tea*, Emulſions, with many other things, whoſe forms we have ſhewn in the Cure of *Melancholy*, are convenient in this caſe.

Other Chirurgical Remedies. Moreover, from *Chirurgical* Remedies, beſides opening of a Vein, many other helps are wont to be had for the curing of this Diſeaſe. *Cupping-glaſſes* with Scarification, often help. *Bliſterings*, *Cauteries* both actual and potential are praiſed of many. Others commend cutting an *Artery*, others *Trepaning*, or opening the Skull, others *Salivation*. But theſe kind of adminiſtrations, beſides that their effects are uncertain, can hardly be performed, or not at all ſafely, by reaſon of the intractability of the ſick; wherefore, it were here ſuperfluous to inquire into the reaſons of help or cure to be expected from them. The hair being ſhaven off, ſometimes it is expedient to apply to the forepart of the Head the hot Lungs of a Lamb or Weather, and other Fomentations, and ſo to change them. But theſe ſorts of Remedies alſo are hardly to be applied and repeated methodically, becauſe of the reluctancy of the ſick, and ſo often afford more hurt than help.

3. The vital Indication. 3. The vital *Indication* inſtitutes how mad people ought to be handled, concerning their government, dyet, and ſleep. In this Diſeaſe there is no need of keeping up the fleſh, as in moſt other Diſeaſes: For the ſpirits ought not to be refreſhed with Cordials, nor ſtrength to be reſtored with Medicines; but on the contrary, both being too raging of themſelves, things are to be adminiſter'd as it were for the ſuppreſſion or extinction of a flame raging above meaſure. Therefore let the diet be ſlender and not delicate, their cloathing courſe, their beds hard, and their handling ſevere and rigid. But ſleep, for that it is very neceſſary, ought to be cauſed ſometimes by *Anodynes*; for which end, *Hypnotick* Remedies or Medicines above preſcribed for *Melancholy*, are alſo convenient in this Diſeaſe. In inveterate and habitual Madneſs, the ſick ſeldom ſubmit to any *Medical* Cure; but ſuch being placed in *Bedlam*, or an *Hoſpital* for Mad people, by the ordinary diſcipline of the place, either at length return to themſelves, or elſe they are there kept from doing hurt, either to themſelves or to others.

Hiſtories and Examples of mad people are to be ſought in Bedlam, or Hoſpitals for mad people. There is no need to illuſtrate the nature of this Diſeaſe with Hiſtories and Examples, or to deſcribe the manifold Types of it; but rather let them go to the *Hoſpitals* of Mad people, where they may behold, not without a wonderful ſpectacle, as it were a new and monſtrous nation of men, contrary to rational people, and as it were our *Antipodes*; all which, if they were gathered together in one place, and that all, Madmen and Fools were joyned to them; I know not whether this world would not be equally divided between them and the ſober and prudent.

The Cure of Intermitting Madneſs. Thus much concerning the cure of continual *Madneſs*. The intermitting, either has perfect lucid intervals, in which the ſick return to themſelves, or the fury only ceaſes, the *Delirium* being ſtill left, inſomuch that the diſtemper'd become gentle and tractable, yet ſtill they continue amiſs, as to their imaginatiou and judgment, and ſpeak and do many abſurd or incongruous things, and afterwards ſometimes again become furious.

The Curatory Indication. The Cure of either of theſe Diſtempers, as to the Curatory Indication, is the ſame, as in continual *Madneſs*, ſo that there is no need to ſhew here any other Medicines, or method. But as to what reſpects the *Prophylaxis* or Preſervatory Indication, by which the means of healing is inſtituted out of the fits, cautions and threatnings are to be given them; in whom only the Fury intermits, the *Delirium* remaining, the very ſame Remedies of Medicine, which we have preſcribed for the taking away the foregoing cauſe of *Melancholy* are convenient.

Preſervatory. In *Madneſs* which perfectly intermits, as to all its *Symptoms*, at the chiefeſt convenient times, to wit, Spring and Fall, they ought to enter into a ſolemn courſe of *Phyſick*; and beſides, there is a continual need of looking to, or governing the ſick, both as to diet and to their manner of living, that they may be always preſerved in an equal and a moderate temper; and alſo, that as ſoon as the ſigns of the approaching fit appear, its coming may be hindred by Blood-letting, and by adminiſtring of Medicines.

Therefore, in the times of the *Æquinoxes*, let Blood be taken out of the Arm, and ſeven or eight days after out of the *Hemorrhoidal* Veins by Leeches. Let Purges and Vomits be given twice or thrice at due intervals. Moreover, between whiles, let them take in order altering Remedies, at *Phyſical* hours. The *Formulas* or *Recipes* of theſe are ſet down both in this Chapter and in the former for the cure of *Melancholy*. Let the dyet be ſlender and of good digeſtion; as concerning exerciſe or motion, ſleep, and other *non-naturals*, let them be all moderate. When the approach of *Madneſs* is ſeen to be at hand, and conſtantly before the Summer *Solſtice*, let *Phlebotomy* be celebrated, with Vomiting, and a more ſlender or ſparing diet.

CHAP.

CHAP. XIII.

Of Stupidity, or Fooliſhneſs.

Stupidity, or *Moroſis*, or Fooliſhneſs, although it moſt chiefly belongs to the Rational Soul, and ſignifies a defect of the Intellect and Judgment, yet it is not improperly reckoned among the Diſeaſes of the Head or Brain; foraſmuch as this *Eclipſe* of the ſuperior ſoul, proceeds from the Imagination and the Memory being hurt, and the failing of theſe depends upon the faults of the Animal Spirits, and the Brain it ſelf.

Stupidity ariſes chiefly from the failing of the Imagination and Memory.

We have before clearly ſhewed, that the Rational Soul doth ſubſiſt in a ſenſitive or corporeal Soul, and that its principal ſeat is the Imagination: Further from *this*, and the *Memory*, either the notions themſelves, or their occaſions of all things are ſupplied, which the Mind beholds; wherefore, when it happens that theſe Corporeal Functions are defective or hindred, forthwith the eye of the Intellect, as if covered with a vail, is wont to be very much dulled, or wholly darkned. Therefore, that the reaſon of *Fooliſhneſs* and *Stupidity* may be rightly delivered, firſt we ought to inquire by what means, and from what cauſes, the *Imagination* and the *Memory* are often defective or fore-hindred.

Wherefore the Organs of theſe Faculties labour in this Diſeaſe:

That we may proceed methodically, concerning theſe, hither ought to be referred, what we have diſcourſed before concerning the Functions of the Corporeal Soul, and their ſubjects and inſtruments. we have at large declared that the *Callous* Bodies, or the middle of the Brain is the ſeat of the *Imagination*; and the Cortical Marrows of the Brain, the ſeat of the *Memory*; and further, that the Animal Spirits are the immediate organs of either. Wherefore, becauſe their powers being hindred (which are the firſt or chief movers of any other Function, both rational and ſenſitive) the Imbecillity and dulneſs of the mind, the ſlowneſs of the ingenuity, ſtupidity and madneſs at length do often ariſe; the fault is either in the Brain it ſelf, or the Animal Spirits, or both together, and at firſt now theſe, now that.

1. As to the Animal Spirits, we have largely enough declared, of what ſort they ought to be, of their proper and genuine nature, and what they are by reaſon of their preternatural diſpoſition, in the *Phrenſie*, *Melancholy*, and *Madneſs*. But beſides (which we before mentioned) it may be ſuſpected, that theſe Spirits being ſometimes almoſt deſtitute of active Particles, become as it were liveleſs or vapid; to wit, when the ſpirituous Particles ought to excel, and to get to themſelves volatile Salts; in *Stupidity*, both theſe, together with the Sulphureous, being too much depreſſed, they are almoſt drowned and overwhelmed with the watery and terreſtrial. For indeed, Fools are not ſo dull or of ſuch thick underſtanding, as their ſoul ſeems to be indued with, and their Animal Spirits are rather formed of clay than their Heart. There are many occaſions or evident cauſes, by which the Animal Spirits acquire ſo deadiſh a texture, the chief of which we ſhall touch on by and by.

2. But it doth not frequently come to paſs, that *Stupidity* is excited by the mere ſolitary fault of the Spirits, or of the Corporeal Soul it ſelf, but more or rather the Brain it ſelf is found to be firſt in fault: For as there are many things requiſite, by which this exact ſubject or machine of the Animal Function is conſtituted, if by chance any thing of them be deficient or depraved, it eaſily follows, that ſuch ſo diſtemper'd have little wit.

1. As to Magnitude.

Firſt, It is a vulgar obſervation, That the wit and ingenuity doth depend ſomewhat on the magnitude and figure of the Head, and conſequently of its Brain; for as to its bulk, it is a Proverb, that it argues little of Brain or too much Fooliſhneſs. And although this does not always happen, yet it does for the moſt part. The reaſon of which is, becauſe in a little Brain but a few Spirits are begotten and exerciſed; but in a greater, conſiſting for the moſt part of a vile or baſe texture or frame, it is leſs fitted for the quickneſs or ſharpneſs of the mind.

2. By Reaſon of the Figure.

Secondly, The genuine and beſt figure of the Brain ought to be globous; to wit, for the end that the Spirits may be poured forth with an equal efflux on every ſide, from its middle part to the whole compaſs, and may be from thence retorted every where by equal angles of reflections. But thoſe who have a flat head, or too ſharp, or otherways improportionate, are affected for the moſt part with ſome noted fault of the Animal Function; for theſe kind of Brains, like diſtorted Looking-Glaſſes, do not

rightly collect the Images of things, nor truly object them to the Rational Soul.

3. As to its Subſtance or Texture.

Thirdly, The ſubſtance of the Brain ſhould be well temper'd, and of a laudable frame; not only as to the qualities of heat and cold, of drineſs and moiſture, but its *Syſtaſis* or Conſtitution conſiſting of plenty of a volatile Salt and Spirit, with a moderate proportion of the reſt ſhould be thin and airy, that the Spirits may paſs thorow the whole, and cut out to themſelves paths; alſo it ſhould be moderately firm and compacted, that the tracts and paſſages being made, may remain, and not be preſently blotted out again, by the ſinking of the too ſoft parts. But in *Stupidity*, it is to be ſuſpected, that there is in the Brain an exceſs of ſome manifeſt quality, as of moiſture or coldneſs; for which reaſon, Children and old people are wont to be affected with a dulneſs of their ſenſes; or ſometimes, the Texture is too thick, and Earthy; ſo that the ſpirits do not eaſily irradiate it, or cut tracts for themſelves; to wit, they cannot penetrate an opacous or thick body, no more than rays of light. To this kind of deadiſh Texture of the Brain, thoſe that are born of Plowmen and Ruſticks, as if they were formed of a worſer clay, are obnoxious; hence in ſome Families, reckoning many deſcents backward, there is ſcarce one witty or wiſe man found. In ſome places, the influences of the Heaven and Air incline, as it is thought, the Inhabitants to Stupidity; ſo, to be born in *Batavia*, is proverbially, as much as to ſay, a Fool.

4. The evil conformation of the Brain, as to its pores and paſſages.

Fourthly, Beſides theſe vices of the Brain, which are for the moſt part original and born with it, ſometimes its evil conformation, as to its Pores and Paſſages, by reaſon of ſome acquired inordinations, is a cauſe that the Animal Function is not rightly performed. For firſt of all, as to what appertains to the ſmaller Paſſages and Pores of the Brain (which the ſpirits themſelves frame every where thorow its whole ſubſtance, and perpetual flow into them for the exerciſe of the Animal Functions) it ſometimes happens that theſe are either defective or perverted, and ſo bring on a dulneſs of mind, or *Fooliſhneſs*. Theſe little ſpaces are defective, becauſe the conſiſtency of the Brain being either too obdurate or too fluid, it will not indure to be cut thorow after a due manner, or to remain or continue ſo bored thorow. But we ſuſpect thoſe Paſſages to be perverted, either becauſe they are too looſe or too ſtrait, or elſe, for that their making is unequal. Too ſtrait Pores do not ſufficiently admit ſtore of matter for a good plenty of Spirits: Thoſe looſe above meaſure, receive together with that matter, *Heterogeneous* Particles, and infeſting the Animal Regiment. They ſeem to be unequally formed, where they are more open in one part of the Brain, and more ſtrait in another. For this cauſe we think it to be, that ſome underſtand, or know things well enough, but ſtill judge evilly; for that their notions and conceptions, like the viſible Images, paſſing thorow a diverſe Medium, become diſtorted. Further, perhaps for this reaſon it comes to paſs, that ſome excel, or are ſtrong in Imagination and Phantaſie, yet are very deficient in Memory, and others on the contrary.

3. Stupidity ſometimes proceeds from both of them being in fault together.

3. It ſometimes happens, that both theſe conjunct cauſes do concur together to Fooliſhneſs, to wit, becauſe both the Animal Spirits are dull and torpid, and alſo the Brain evilly conformed. And in truth, which part ſoever is firſt in fault, it quickly will make the other in like manner guilty. Becauſe when the Spirits being blunt and ſluggiſh do not freely paſs thorow the Brain, the Pores and Paſſages in it are not either ſufficiently cut thorow, or elſe they cloſe again; and the Spirits if they cannot expand themſelves, by reaſon of the evil texture of the Brain as they ſhould do, they at length becoming ſlothful and idle, grow heavy, and acquire a vicious diſpoſition.

What the Antecedent Cauſes of Fooliſhneſs, are,

Thus much concerning the Conjunct Cauſes of *Fooliſhneſs*, as to its *Procatartick* and *Evident*, there belong more occaſions, by reaſon of which the aforeſaid evils are wont to be brought to the Brain, or the Spirits, or to both together.

1. An Hereditary Diſpoſition.

For in the firſt place, *Stupidity* (as we but now obſerved) is ſometimes original or born with one, and ſo it is either *hereditary*, as when Fools beget Fools, the reaſon of which is clear enough, to wit, the ſame weak Particles flowing for the conſtituting the Animal Organs in the Son, which were in the Father: or *Stupidity* being born with one, is as it were accidental, to wit, it frequently happens, that wiſe men and highly ingenious, do beget Fools and Changelings, or heavy witted: which we ſuppoſe ſo to come to paſs ſometimes for this cauſe, for that the Parents being too much given to ſtudy, reading, and meditation, the Animal Spirits that inhabit the Brain, are ſo much waſted, that for the ſupply of them, the moſt generous Particles of the Blood are ſtill carried to the Head, and but few only, and ſmall, are permitted to deſcend to the *Spermatick* Bodies. When the rational Soul becomes greatly ſolicitous in bringing forth its child (which are the works of the Intellect) then the Corporeal Soul (the Spirits being called away to wait on the other) becomes not at all, or very weakly prolifick.

Why ſtrong or wiſe men are not always begotten of ſtrong and wiſe Men.

The firſt Reaſon.

A Second Reaſon.

Beſides this reaſon, there is another frequently to be met with, wherefore the firſt implanted ſagacity of men, as well as of *Brutes*, is not often propagated from the

Parents

Parents to the Children. For when as we preſume certainly, the Colt of a generous Horſe, or of a delicate ſtrain, or the Chickens of a Game-Cock, that they will *patriſſare*, or be like their Sires, ſo that they are ſold at a great rate, and the virtues of theſe, if not broken by inordinate and preternatural feeding or bringing up, deſcend by a long ſeries to their young from age to age: This often happens otherwiſe to men, to wit, becauſe the Parents do ſo enervate and weaken their bodies by intemperance, luxury, and evil manners, that they beget only languiſhing and unhealthy Children. Hence it is, that for the moſt part, thoſe who are born of Parents broken with old age, or of ſuch as are not yet ripe or too young, or of drunkards, ſoft, and effeminate men, want a great and liberal ingenuity or wit. Nor does there happen a leſs detriment to them of the Animal Faculty, whoſe ſires are obnoxious to evil affections of the Brain, as the *Palſie*, *Epilepſie*, *Carus*, *Convulſions*, and the like; ſo that to be born of Parents who *have a ſound mind in a ſound body*, is far beyond a large patrimony.

Secondly, There are more evident cauſes, by which *Stupidity* is wont to be induced, to ſome originally whole. Some at firſt crafty and ingenious, become by degrees dull, and at length fooliſh, by the mere declining of age, without any great errors in living; to wit, becauſe the nervous liquor, and the blood, (whoſe evil diſpoſitions the Animal Spirits partake of) like ſome Wines, and other fermented liquors, depart from their vigor after a perfect Fermentation, and by little and little degenerate into a dead and pallid ſubſtance. For it is obſerved, the wits of ſome people do receive a various increaſe and decreaſe, according to the periods of their Ages. I have known many in their childhood very ſagacious, and extreamly docil or apt to learn, that by their literature and diſcourſe have cauſed admiration, who afterwards becoming young men, were dull and heavy: and thoſe who at firſt were very beautiful, were afterwards not at all handſome, or beautiful in their aſpect. In like manner, it often happens on the contrary, that many at firſt indocil or unapt to learn, and wholly unfit for literature, and ſeeming of an ill favour'd countenance, when they have become young men, or have put off their childhood, have had both an excellent wit, and become beautiful. The reaſon of the former is, that ſome ripe wit, or ingenuity, like garden fruit, does not remain long in the ſame condition, but ſoon declining, quickly withers. For in every mixture or concretion rightly made, there is required, that a progreſſion from crudity to maturity be made gently and by little and little, that is, the active elements do not at firſt ariſe above the reſt, and ſhew themſelves above meaſure, but being involved with the others, riſe up and put forth themſelves by little and little; for otherwiſe, being too free in the beginning, and made looſe, they eaſily fly away, leaving their ſubject almoſt dead or taſte leſs. Wherefore, Boys who are ſeen to be dull in their firſt Age, may be hoped afterwards, when the temper of the Brain (the ſuperfluous moiſture being evaporated) is come to maturity, to become ingenious enough.

2. *Ripeneſs and the Declination of Age diſpoſe ſome to Fooliſhneſs.*

Thirdly, Sometimes great ſtrokes or bruiſing of the Head, eſpecially ſuch as happen from a fall from ſome high place, do bring hurt or debility to the Animal faculties. I have known ſome very learned, and men of great wit and judgment, who outliving ſome of theſe falls by chance, afterwards were of a heavy and dull ingenuity. It is commonly ſaid of ſuch ſo diſtemper'd, that their Brain is turned; and indeed a vehement Convulſion or ſhaking of the Brain, greatly perverts, and not ſeldom preſſes together, or ſhuts up the accuſtomed tracts and paths of the Spirits, ſo that they perform the acts of the Memory and the Imagination for ever after, hardly, and amiſs; ſo as ſome by ſome great wound inflicted on the Head, have become ſottiſh, and afterwards mad.

3. *Great hurts of the Head ſometimes cauſe Doting, or want of Ingenuity.*

Fourthly, Frequent Drunkenneſs and Surfeiting, eſpecially if they ſleep in their Cups, and lie as it were buried in Wine and Sleep, do very much decay the wits of ſome, and make infirm the uſe of their Reaſon; to wit, becauſe by them, *Heterogeneous* little Bodies, and infeſting very much the Animal Regiment, are introduced. Almoſt for the ſame reaſon, the frequent uſe of *Opiates* very much troubles the ſharpneſs of the mind.

4. *Frequent Drunkenneſs.*

Fiftly, Violent and ſudden paſſions, as in the firſt place, an unexpected and very great affright, or terror or vehement ſadneſs, have cauſed Sottiſhneſs or Fooliſhneſs in ſome, ſo that they have been ſcarce able to expreſs the ſenſe of their mind in words, or to perform the familiar actions of life. Which certainly comes to paſs, foraſmuch as the ſpirits inhabiting the Brain upon ſuch an occaſion, are very much diſſipated and drawn aſunder one from another, and afterwards, are not able to repeat the the former footſteps of their motions; in like manner as Souldiers, being put to flight by a ſudden and violent attack of the enemy, recover not eaſily their orders and ſtations.

5. *Vehement Affections.*

Sixthly, It is obſerved, that ſome men have contracted alſo *Fooliſhneſs*, by reaſon of cruel Diſeaſes of the Head. This frequently happens in a great and long *Epilepſie*, for that this Diſtemper, poſſeſſing the middle part of the Brain, perverts, and ſo fills and ſtuffs

6. *The more grievous Diſeaſes of the Head, oftentimes excite Fooliſhneſs.*

ſtuffs up with feculencies, all the Pores and paſſages, the Spirits being thereby frequently and vehemently thruſt forth, that the tracts of the Spirits being ſhut up; the acts of the internal Senſes and Motions are hindred. I knew a young maid, at firſt of an acute wit, and lively ingenuity, who after ſhe had long laboured with the Falling-ſickneſs, became ſottiſh and fooliſh, like a changeling. Further, I have taken notice in many, that *Stupidity* hath accompanied the *Palſie*, or has gone before it (as we mentioned in the Chapter of the *Palſie*) to wit, the ſame matter which brings a reſolution or looſning, being in the Streaked Body, being heaped up in the *Callous*, cauſes often, if not an *Appoplexy*, or *Carus*, a *Fooliſhneſs*.

The Differences of this Diſeaſe. Many differences of this Diſeaſe are to be met with; and firſt, there is commonly wont to be a diſtinction between *Stupidity* and *Fooliſhneſs*, for thoſe affected with this latter, apprehend ſimple things well enough, dextrouſly and ſwiftly, and retain them firm in their memory, but by reaſon of a defect of judgment, they compoſe or divide their notions evilly, and very badly inferr one thing from another; moreover, by their folly, and acting ſiniſtrouſly and ridiculouſly, they move laughter in the by-ſtanders.

How fooliſhneſs and ſtupidity differ. On the contrary, thoſe who are *Stupid*, by reaſon of the defect of the Imagination and Memory, as well as of the Judgment, do neither apprehend well, or quickly, nor argue well; beſides they behave themſelves not as the others by toying and geſticulation, but ſottiſhly, fooliſhly, or like a dull Aſs; ſo that the *ſimplicity* of theſe is the more miſerable, who ſhew ſo the Diſeaſe in their countenance and behaviour. In *Fooliſhneſs*, it ſeems, that the Animal Spirits being ſomewhat active, though leſs firm, do paſs thorow only more ſhort and oblique tracts, and do not beam thorow the Brain, with an equal and conſtant irradiation, but leaping forth, or running out deſultorily or after a leaping manner, ſometimes here ſometimes there perform the acts of the Animal Functions, perfunctorily only, or ridiculouſly. But in *Stupidity*, the Spirits being obtuſe and dull of their own proper nature, and flowing, very little pervious in the more thick Brain, cannot exerciſe themſelves rightly, for the performing the offices of the Animal Regiment.

Degrees of ſtupidity. Stupidity (whoſe *Pathology* we here chiefly deliver) hath many degrees; for ſome are accounted unfit or incapable, as to all things, and others as to ſome things only. Some being wholly fools in the learning of letters, or the liberal Sciences, are yet able enough for *Mechanical* Arts. Others of either of theſe incapable, yet eaſily comprehend *Agriculture*, or Husbandry and Country buſineſs. Others unfit almoſt for all affairs, are only able to learn what belongs to eating or the common means of living: Others merely *Dolts* or drivling Fools, ſcarce underſtand any thing at all, or do any thing knowingly.

The Prognoſtick of the Diſeaſe. As to what belongs to the *Prognoſtick*, *Stupidity* being contracted from the birth or hereditary, or happening from unknown cauſes, if it ſtill perſiſts to ripe age, it is almoſt never healed: but when it happens that Children being at firſt dull and almoſt inſenſible, by reaſon of the complexions of both their Brain and Spirits being ripened, they are made ingenious and docil enough.

Evil if from an hurt of the Head. This Diſeaſe excited from an evident ſolitary cauſe, as from an hurt of the Head, or a violent paſſion, alſo coming upon an inveterate *Epilepſie*, if it continues for ſome time, it is afterwards incurable.

What is excited from a Lethargy admits a Cure. What ſucceeds a *Lethargy*, and any other ſleepy Diſeaſes, depends chiefly on the hurt of the Memory, and ſometimes vaniſhes of its own accord, thoſe Diſtempers being cured. Therefore, when in theſe caſes the cure of *Stupidity* is inſtituted, here are convenient almoſt the ſame method of healing and Remedies, which we have preſcribed in the Preſervatory *Indication* of the *Lethargy*; the chief intentions of which are, that the Animal Spirits being freed from any torpor or benummedneſs, cut forth or frame Pores and paſſages within the tranſlucid Brain, and may be expanded truly in them.

Sometimes it is cured by a Feavour. Sometimes a *Feavour* has cured ſome Fools, and ſtupid, and render'd them more acute. *Huartus* tells of a certain man that was a Fool in the Court of *Corduba*, that being diſtemper'd with a malignant Feavour, came ſo much to himſelf in the midſt of the Diſeaſe, and with that judgment and diſcretion, that the whole Court ſtood in admiration; and ſo remained his whole life afterwards, one of the moſt prudent men of his time. We our ſelves have known a certain man of a very blunt, *Bœotick* or dull wit, who talking idly in a Feavour, moſt ſuddenly brought forth moſt acute ſpeeches, and ſeaſoned with a great deal of ſalt or ingenious wit. Further, we before ſpoke of a generous old Gentleman, who having loſt his memory, and ſo the uſe of diſcourſe, received great help by the diſtemper of a Feavour happening afterwards; the reaſon of which ſeems to be, becauſe the feavouriſh burning ſometimes rarefies and diſpels the darkneſs covering the Brain.

As to what reſpects the cure of this Diſeaſe, *Stupidity*, whether innate or acquired (if it be not plainly *Madneſs* or *Stolidity*, uncapable of all learning) though it may not be cured, yet is often wont to be amended. Wherefore it muſt be the work both of a *Phyſician* and a *Teacher*, that the wit of ſuch that are ſo affected, may be ſomewhat trimmed, and they being at leaſt brought to the uſe of reaſon in a little meaſure, may be accounted out of the number of *Brutes*. *The Cure requires both a Maſter and a Phyſician.*

For this end, becauſe dull or ſenſeleſs Beetles, or the more dull Loggerheads or Blockheads, do not readily learn the common notions of things, no more than Children the firſt elements of letters, therefore they are to be inſtituted in all things, by the frequent care of a Maſter, and the ſame things are again and again to be inculcated to them. For by this means, the Spirits, though ſlow and torpid, are a little ſharpened by perpetual exerciſe, and they being continually excited in the Brain, how rude and craſſe ſoever they be, do cut forth at length for their expanſion, ſome tracts or paſſages, though more imperfect. But that this may the more happily and eaſily ſucceed, medical Remedies ought to be adminiſtred, which may purifie and volatize the Blood and nervous Liquor, together with the Animal Spirits; and alſo, that may clarifie the Brain, and render it as it were *Diaphanous*. *what the labour of the former ought to be.* *What the Medical intentions are.*

For the purifying the Blood, let there be ſometimes adminiſter'd a gentle Purge, and *Phlebotomy* in a ſmall quantity, if there be ſtrength, ſeveral times; for that end alſo Iſſues are convenient, in the Arm or Leg, or both, for the driving the filthineſs from the Brain: In fat folks, and ſuch as are indowed with a moiſt Head, let them ſometimes be made between the ſhouiders. Further, ſome in this caſe cry up with wonderful praiſes a *Trepaning*, by which the Brain may more freely breath forth, and evaporate. Let their diet be light and attenuating; their dwelling in a free air, and dry; their ſleep moderate. *What kind of Remedies are ſhown.* *1. Evacuating Remedies.*

After theſe have for ſome time been adminiſtred, in the ordinary and uſual manner, *if that in the left part of the breaſt there is no beating of the heart in the Arcadian youth*, or if there be no ſign of hopes, it will be in vain to ſpend labour and pains, and Medicines any further on them: but if by the uſe of theſe, any ſigns of help, or any hopes appear, ſometimes it will be to the purpoſe to add to theſe, altering Remedies, to be daily taken at medical hours, for a long time. The *Recipes* or *Formula*'s of theſe are already delivered in our *Pharmaceutice* for the taking away the foregoing cauſes of moſt *Cephalick* Diſeaſes; and thence may be taken: moreover what do beſides reſpect this particular caſe, we think here good to add, being ſome magiſterial Receipts. *2. Altering Medicines.*

Take *of the Spirits of Armoniacum, ſuccinated, or with Amber ſix drams; let it be given from fifteen to twenty drops Evening and Morning, in three ſpoonfuls of the following diſtilled water; drinking after it ſeven ſpoonfuls of the ſame.* *Spirits.*

Take *of the freſh leaves of Miſletoe of the Apple tree ſix handfuls; of the leſſer Sage, Roſemary, Savory, the greater Rocket, Mother of Thyme, Calaminths, Penyroyal, Marjoram, each four handfuls; of the roots of Angelica, of Imperatoria, each ſix ounces; of Zedoary, the leſſer Galingal, of the Aromatick Reed, of Winterans Bark, each two ounces; of Cloves, Nutmegs, Mace, Cinnamon, Ginger, each one ounce; of Cubebs, Cardamums, Grains of Paradiſe, each ſix drams; all of theſe being cut and bruiſed ſmall together, poure to them twelve pints of the beſt Canary; let them be digeſted cold, and cloſe ſhut in a veſſel for three days, then diſtilled according to art: let the whole liquor be mixed together, and ſweetned with Sugar when it is taken: The Doſe is two or three ounces.* *A Diſtilled Water.*

After the uſe of the *Spirits of Armoniack* for fifteen or twenty days, other Medicines about that time may have their turns, ſuch as *Spirits* of *Harts-horn*, of *Sal*, *Humane Skull*; *Tinctures* of *Coral*, *Antimony*, *Caſtor*, *Amber*; the *Elixir Vitæ Quercitani*, *Elixir Proprietatis*, Spirits of *Lavender*, *&c.* *Tinctures, Elixirs.*

Or Take *of the Conſerves of the flowers of the Lilie of the valley ſix ounces, of the roots of Acorus veri preſerved ſix drams, of Ginger preſerved in India, of preſerved Nutmeg, each half an ounce; of Species Diambræ two drams, of Lignum Aloes, yellow Saunders, the pioki roots of Zedoary, of Cubebs, of Jamaica Pepper, each one dram and a half; of Coral prepared two drams, of the Syrup of Candied Ginger what will ſuffice; make an Electuary. The Doſe two drams Morning and Evening, drinking after it of the diſtilled Water three ounces.* *An Electuary.*

For thoſe whoſe Brain is too abounding with moiſture, let them drink every Morning a draught of *Coffee*, with Sage leaves boiled in it: For thoſe who have their Animal Spirits too poor and liveleſs, let them take *Chocolate*, as we have deſcribed it above, which *Coffee.* *Chocolate.*

which ſeems moſt profitable. For ordinary drink let ſmall Ale or Beer be prepared in a veſſel containing three or four Gallons, and after it has work'd, put into it in a little bag, theſe following things. Take *of the leaves of Sage, the ſharp leaved and dryed, four handfuls; of Cubebs one ounce, of Cloves and of Nutmegs bruiſed,* &c. Mix them according to art.

Phyſical Beer.

Outward Applications.

Outward Applications have alſo a place here; ſuch are a quilted Cap, Plaſters, and Liniments: and ſometimes let theſe, ſometimes thoſe or others be adminiſter'd.

A Cap or quilted thing for the Head.

Take *of the flowers of the Lily of the valley, Roſemary flowers, Stœchadoes, each one handful; of Celtick Spike two drams, of the roots of Cypreſs, the leſſer Galingal, the Florentine Iris, each three drams; of Labdanum, Benzoin, of Toluvian Balſam, of Amber, each two drams; of Nutmegs, Cloves, Mace, Cinamon, each one dram and a half: make of them all a fine powder, quilting it in a Cap with ſilk between.*

A Plaſter.

Take *of the Plaſter of Floris unguent. ſo called, two ounces, of Tachamahac, of Carrane, of the Balſom of Tolu, each three drams; of the Powder of Amber, Myrrh, each two drams; of Cloves, Nutmeg, Mace, each one dram; being all liquefied or melted together, let them be made into a maſs, of which make a Plaſter, ſpread it on leather, and the head being ſhaved, put it to it.*

A Liniment.

Take *of the Oyl of Palms half an ounce, of Capive Balſom three drams, of the Balſom of Peru one dram, of the Oyl of Nutmeg, by expreſſion two drams, Oyl of Amber half a dram; make an Ointment for the Head.*

I might here add many other Medicines, and ways of Adminiſtrations, but in this almoſt deſperate caſe, where oftentimes no Remedies are wont to help, and the Cure never perfected, theſe may ſuffice.

CHAP. XIV.

Of the Gout.

The Diſtempers of the Gout and Colick are Diſtempers of the nervous Stock.

AMong the Diſeaſes of the Head and the nervous ſtock, we may refer hither ſome Diſtempers that are chiefly wont to infeſt the Feet and the Belly, to wit, the *Gout* and the *Colick*. That the ſeat of either is in the nervous parts, we may very well conclude from the primary *Symptom*, to wit, pain. The cauſe of this latter, *Charles Piſo* has affirmed to exiſt within the Head, and *Fernelius* affims the ſame of the other. Wherefore we ſhall endeavour to deliver the *Pathologie* of either, together with the appoſite means of healing them; and firſt we ſhall ſpeak of the *Gout*.

The Subject of the Gout.

The name of the *Gout* denotes plainly its ſubject; becauſe that it is almoſt only *Articulate*, or is in the ſpace where the heads of two or more Bones meet together. This Diſeaſe is wont to be excited more frequently about the *Internodia* or knittings of the Bones of the Feet; becauſe this part being greatly declining, and remote from the *Præcordia*, and the fountain of Heat, receives readily the Morbifick matter, and does not eaſily overcome it, or quickly put it off. Yet the *Gout* often happens in the jointings of the Hip or huckle bone, the knee, the bending of the arm, the ſhoulder, the wriſt, the ancle, and of other parts.

Its appearances rehearſed.

The fits of this Diſeaſe (which are almoſt ever intermitting) invade either wandringly, or periodically; which being finiſhed, ſometimes ſooner, ſometime more ſlowly, the intervals happen lucid or quiet enough; preſently after the firſt aſſault of it, for the moſt part pains ariſe without any tumor; though afterwards, about the height of the Diſeaſe, the diſtemper'd part often ſwells up; the pains in the beginning yield to no Remedies, but are made more cruel by *Cathartick*s, and are not preſently put to flight by *Topick*s, or wont to be allayed. The Fit moſt often falls upon one without any previous diſtemper, but ſuddenly; yet ſometimes there will be an heat of the blood, or a little feavourish diſtemper going before. The diſpoſition to this Diſeaſe is ſometimes hereditary, and ſometimes acquired, by reaſon of an evil manner of living. The occaſions or cauſes, which being wont to move this diſpoſition, ſtir up the *Gouty* pains, are all violent alterations or paſſions, inflicted on the humors or ſpirits. Hence Surfeiting immoderate drinking, eſpecially of ſharp and thin Wines, tranſpiration being hindred, wrath or indignation, immoderate Venus or Luſt, ſadneſs, alſo the changes of the air, and of the year, and any great mutations ordinarily induce fits of this Diſeaſe. Thoſe obnoxious

to

to this diſeaſe, are ſometimes in danger to be diſtemper'd alſo with the *Stone*, or Gravel in the Reins; and ſo on the contrary, thoſe obnoxious to the Stone, are wont to be troubled with the *Gout*. Yea the *Gout* growing grievous, it every where heaps up about its neſts, to wit, in the joynts, a calculous or ſtony matter, and there excites a ſtony or hard bulk.

The parts affected.

The diſtemper'd parts, whoſe pains are ſtirred up in the hauled Fibres, for the moſt part are the *Perioſtea*, or the heads clothing the Membrane of the Bones, and perhaps the *Tendons* and Ligaments there planted about. But ſometimes the pain in theſe parts, wholly depends upon a breach of the unity, and this proceeds from a certain matter being impacted in thoſe Bodies, or lying upon them; firſt of all we ſhall inquire, what ſort of morbific matter this is; ſecondly, from whence it comes; and thirdly, by what means it ſo ſtirs up periodical *Gouty* Fits, by breaking the unity in them.

The Morbifick Matter.

As to the *Morbifick* Matter it ſeems, firſt that it is not the Blood or nervous juice of it ſelf; nor is it one only ſimple humor laid up a part from the others. We deſervedly excuſe the Blood from this cenſure, becauſe theſe pains only infeſt Bodies for the moſt part without Blood; yea, and almoſt them only. For although in the neighbouring parts, by reaſon of the courſe of the Blood being hindred, ſometimes a tumor happens with an inflammation; yet this is not the Diſeaſe, but a *Symptom*, and for the moſt part comes upon the *Gout*. Further it appears, that the nervous juice (how ever ſharp, or biteing, or pricking, or pulling it is ſuppoſed to be) does not excite of it ſelf the pains of the *Gout*; becauſe then the Diſtemper would cauſe pains alſo, or as much in ſome other paſſages of the nervous parts, and alſo in the *Internodia* or knittings of the Bones.

It is not any ſimple or ſingular Humour ſuggeſted from any of them.

It is improbable, for the ſame reaſon, that any ſingular, excrementitious, or ſuperfluous Humor or Matter depoſited from the Blood or nervous juice, to cauſe the pains of the *Gout*. For if ſuch were only carried thorow the Nerves, it would excite pains by order, and a continual tract, not firſt in the feet or extream joints, but by irritating the nervous Stock in its whole journey. If that according to the opinions of *Hollerius*, *Sennertus*, and other Moderns, it be affirmed, that ſome impurities falling off from the heated Blood, and received by the joints, is the material cauſe of the *Gouty* pain; then it ſhould follow, that all who are greatly obnoxious to the *Gouty* Diſtempers, are alſo moſt prone to Feavouriſh burnings or heats; and that a Feavouriſh heat ſhould precede every aſſault of this Diſeaſe; neither of which to be true, common obſervation doth witneſs. For thoſe troubled with the Gout, as it were with a priviledge (to wit, by reaſon of the *Saline* diſpoſitions of the Humors) are free from a *Feavouriſh* Diſtemper. Further, the Fits of the *Gout* moſt often ariſe of a ſudden, without any great ſwelling up or ebullition of the Blood, and preſently at the beginning become very cruel; which alſo argues, that the Morbific Matter is not by degrees laid up in the diſtemper'd part, as in a Mine, and then to excite pains by its fulneſs. For if it were ſo, the beginnings and the increaſe of the Diſeaſe, being always made *gradatim*, they would be longer and more durable; nor doth the diſtemper (as it often is wont) being preſently vehement, by and by change its ſeat, and quickly vaniſhing in one place, anon ariſe up in another.

In the Mine of this Diſeaſe two humours concur, and mutually grow hot.

When therefore any ſingular humor (of which ſort ſoever it be ſuppoſed) ſeems not efficacious enough, for the proviſion of the Fits of the *Gout*; we may affirm, That in the neſt or mine of this Diſeaſe, (whether it be one or many), that many fermentative juices, and thoſe not eaſily to be mixed, do meet together; then from the ſtrife and growing hot of theſe, the painful Vellications or pullings of the nervous Fibres do ariſe.

In like manner, as when the Spirits of Vitriol are poured upon Oyl of Tartar.

Formerly diſcourſing of the wandring *Scorbutick Gout*, and the *Rheumatiſm*, we plainly ſhewed what was alſo the cauſe of this *Gout*, of which we now treat; *viz.* foraſmuch as it appears by a very vulgar experiment, that ſalts being put in a diverſe ſtate, to wit, ſome of them being fixed or *Alchalizate*, and others having gotten a flux, or ſharp, or acetoſous things, being put together, do very much boil up and grow hot, and their humidity cauſing a white and hardiſh *Coagulum* or curdling; as for inſtance well known, when the ſpirit of *Vitriol* is poured to oyl of *Tartar*, it manifeſtly appears; and why may we not think, that in the fits of the *Gout*, there is ſomething like it? to wit, that from the fighting and mutual conflict of the Liquors, which are of a diverſe *Saline* nature, the nervous Fibers are pricked and provoked, and at length, from the various *Coagulations* of either juice, that there is ſometimes heaped together in the diſtemper'd places, a *Calculous* or ſtony matter.

A Vitriolick Matter partly ſupplied from the Nervous Liquor.

That we may ſhew the genuine matter of the *Gout*, we ought to referr hither, what we have elſewhere ſaid, concerning the nouriſhment of the ſolid parts. For indeed, we have ſhewed, that to that office both the Blood, and the nervous Liquor do bring their

their tributes; to wit, when the nouriſhing juice is carried from the Blood, thorow the Arteries, to all the parts of the whole body, another liquor being depoſited from the Brain, thorow the Nerves, and their dependences, doth actuate that former, as it were with an inſpired ſpirit, ſo that it is made full and fertil, and ſo more eaſily inſinuates into the Pores and paſſages of the part that is to be nouriſhed, and is aſſimilated into its ſubſtance. There will be no need to repeat here what we have formerly diſcourſed at large; as to what reſpects the preſent matter, we ſhall take notice, that the nutritious humor, diſtributed from the blood, conſiſts of a little Spirit, but of more plenty of Water, Earth, and Sulphur, and moderately of Salt, ſomewhat volatile; further, whilſt the nutritious humor is diſtributed, for that its Particles, which are for the cheriſhing or nouriſhment of any part, ought to be proportionate, and to remain like it ſelf; therefore, whilſt the ſpirituous are deſtinated to the Brain, and the ſulphureous to the fleſh, the inwards and the fat, it is behoveful, thatthe moſt *Saline* and more fixed, ſhould be laid up about the jointings of the Bones, and then growing full with the nervous liquor, to be aſſimilated with them.

Either Matter, growing degenerate or depraved, turns to the Gout.

But if by reaſon of the vitious *Dyſcraſie* of the Blood, it happens that Particles ſaltiſh above meaſure, and fixed, ſhould be laid up in the joints, and by reaſon of their inconguity are not preſently aſſimilated; they ſoon after grow together into an heap, or a certain Morbific mine. But the Fit of the *Gout* is not wont for that reaſon to be excited, but an heavineſs only and languiſhing of the diſtemper'd member, which is oftentimes taken away by abſtinence, or exerciſe, or Phyſick; the ſtrange Particles being diſcuſſed, or ſupped back again into the Blood.

1. From the Blood, for that it becomes full of a fixed Salt.

But if the Particles of the nervous liquor degenerate from a volatileneſs into an acetous Flux, a flowing ariſing from thence, they fall down in too great plenty into the little joints, and becauſe they there grow hot, with the *Saline* or *Lixivial* Mine, there before laid up, they ſtir up the Fits of the *Gout*.

2. From the nervous Liquor, for that it is acetoſous or ſharp.

The former is, as it were, the ſeminine Seed of the Gout;

The *Saline* or *Tartarous* Matter therefore being laid up from the Arterous Blood, about the jointings together of the Bones, is as it were the ſeminine ſeed of this Diſeaſe; which notwithſtanding, though there be heaped together a great plenty of it, is of it ſelf wholly unfruitful, like an Egg without a Cock; until the nervous liquor growing turgent, ſends its acetoſous Recrements falling from it, into the neſt of the former; which immediately, as it were the maſculine ſeed, renders the other prolifick. For inaſmuch as thoſe two Particles which are of a different ſtate and original, do meet together, and mutually concur, they pull or haul the Fibres of the Membranes and Tendons, and ſo ſtir up the fit of the Gout; the allaying of which, wholly depends upon the mutual ſubaction or bringing under, and the diffiation or blowing away of the moſt ſharp Particles of either kind.

The other maſculine.

The Procatartick, or foregoing Cauſes of the Gout.

Theſe things concerning the formal reaſon, and the conjunct cauſe of the *Gout*, being thus laid down, we will proceed to the further unfolding its *Procatartick* or foregoing cauſes: And we ſay, that theſe are a *Saline* matter, laid up from the Blood in the joints, and *acetous* or ſharp Recrements, ſent into the ſame neſt, from the ſwelling up of the nervous liquor.

1. A Mine of fixed Salt laid up about the Internodia, or Knitting together of the Bones.

Firſt therefore, that this ſort of *Saline* Mine is laid up about the jointings or knitting of the Bones together, is plainly argued by the ſudden and unlook'd for aſſault of this Diſeaſe, and from its difficult cure; for the matter doth not flow into the diſtemper'd part altogether, and at once, in ſuch abundance, that it ſhould excite a fit ſo grievous and tedious; beſides, for that the pains are repeated ſtill within the accuſtomed neſt, it ſeems that their fetation or hatching doth moſt certainly depend upon the Egg ſomewhere laid up before hand. But that this matter is not merely Excrementitious, but a portion of the nouriſhing juice, degenerate towards a fixed Salt, being deſtinated to the ſame bony parts, we may lawfully conjecture, becauſe an humor merely Excrementitious, would cauſe in the diſtemper'd place, a continual trouble and tumor; moreover, this plainly convinces, from the cure of the *Gout*, by torture or cutting of the part: For *Authors* worthy to be believed, have told us in their writings, that the Member being cut off, in which the ſickneſs uſes to be, or greatly wounded, that the Diſeaſe has ceaſed without any relapſe; in like manner as a moſt grievous Tooth-ack, and continual, is moſt often cured by pulling out the diſtemper'd Tooth.

This Matter is not meerly Excrementitious,

nor a Bilous or Phlegmatick Humour.

If that the *Gouriſh* humor were (as it is commonly ſaid) a *Cholerick*, or a *Phlegmatick* humour, or any other merely Excrementitious, it flowing afterwards to ſome other member, after the former diſtemper'd were cut off, would there excite a new Morbific Mine; but this happens only in ſome accuſtomed joints, for that this or that part is become more weak, and ſo admits into it ſelf the more eaſily, all other filthy portions; and neither aſſimilating nor ſending them away, ſuffers them to increaſe into a Morbific Mine. Further, the Recrements alſo of the nervous juice, that are ſharp and acetous, fall down more readily into the ſame part by reaſon of its debility. But

But to the *Saline Procatarxis*, or foregoing cauſe of this Diſeaſe, lying in the Joints; not only the weakneſs of the diſtemper'd member, but much more and firſt of all, the evil diſpoſition of the Blood doth help. We ſhall weigh a little the reaſons, and the manner how it is done; of either.

To this previous procatarxis, to wit, a fixed Salt, the Diſcraſie of the bloud, and the debility of the Diſtemper'd Member doth help.

1. And in the firſt place, the fault of the Blood is, that its elementary Particles, and chiefly the Saline, are not in a fit ſtate or condition. For they ought to be within the maſs of the Blood, in the middle betwixt a fixed and a volatile conſtitution: they are called fixed, ſo long as the Sulphur and Earth being combined, do pertinaciouſly adhere to them; as it is obſerved in freſh and raw Urine, from which you ſhall not eaſily draw by diſtillation, either Salt or Spirit: But the ſaline Particles are votatiliſed, when leaving the Sulphur and Earth, they adhere to the ſpirituous, and with them fly away; as it is ſeen in the ſpirit of Urine, being diſtilled after a long digeſtion. Then there is a middle conſtitution between theſe, when the Saline Particles are ſo looſned and diſlocated from the Sulphureous and Earthy Particles, that upon occaſion they may be eaſily laid hold on by the Spirituous, and aſcend together with them; as it is in Urine putrefied by digeſtion, from which with a very little heat, you may force out Spirit and Salt. In like manner the Saline Particles in a living body, ſeem firſt of all to be in a degree of fixity, within the *Chyle*; from which, notwithſtanding, through Concoction in the Bowels, being rightly made, they begin to come forth a little. Secondly, theſe are made volatile in the nervous juice: And, Thirdly, they are of a middle conſtitution in the bloody maſs; to wit, which are exalted by a continual circulation or digeſtion, ſo that they are in ſome manner volatile, that being aſſociated, partly with ſpirituous particles, and diſtilled forth with them into the Brain, they go into Animal Spirits; and partly going into the nutritious juice, together with the ſulphureous and others, they increaſe in their nouriſhing the ſolid parts.

What the Saline Particles of the bloud ought to be, to wit, in a middle ſtate, between fixation and volatiliſation.

But ſometimes it happens, that the ſaline Particles (at leaſt not all) are not rightly exalted within the bloody maſs, but remaining in a ſtate of fixity, give a beginning or cheriſhing to many Diſeaſes. That we may ſay nothing of the *Scurvy*, *Dropſie*, and many others, we only ſay for the preſent, it may be ſuſpected, that the firſt ſeeds of the *Gouriſh* diſtemper depend upon this cauſe; for when the nervous juice, being deſtinated to the heads of the bones (where it is chiefly received) ought to conſiſt of very much Salt, there is a neceſſity, that its Particles, becauſe they are too fixed and thick, cannot be admitted preſently into the Pores and paſſages, ſhould increaſe into a Morbific Mine. Beſides, that more eaſily and more often happens, if the weak or broken Fibres of the bodies, planted near, cannot by wrinkling themſelves, ſhake off what is troubleſome or ſuperfluous.

When, being too fixed, they become Morbifick.

And ſo they bring forth the Scurvy, Dropſie, and other Diſeaſes, and eſpecially the Gout.

As to the ſecret leading or evident cauſes, from which the nutritious liquor being brought from the blood to the joints, is imbued too much with a fixed Salt, and by reaſon of which, theſe parts become too prompt and eaſie for the receiving what is improportionate to them, the chief of theſe, for that they are various and manifold, we will briefly touch upon.

The Saline fixed, or Arthritical Diſpoſition of the Blood, proceeds from various Cauſes.

1. And firſt of all, an hereditary diſpoſition is wont to produce either evil. For thoſe troubled with the *Gout*, for the moſt part beget Gouty Children, and this Diſeaſe deſcending from the Parents to the Children, is wont not only to have the like fruits in both, and alſo to ripen about the periods of the ſame age; but for the moſt part, it hath its firſt roots in the ſame members, and obſerves every where the like progreſſes: concerning the reaſon of which, I think, we have already ſaid enough, being the ſame as other Diſeaſes propagated *ex traduce*, or from the Parent.

1. Sometimes it is Hereditary.

2. But indeed, the *Gouty* diſpoſition is brought in oftentimes without any original fault, by reaſon of an evil manner of living, and errors in the ſix *non-naturals*. For thoſe who are given to Surfeiting and drinking much, and indulge their appetites by an inordinate eating and drinking, and eſpecially if they feed on ſalt and ſpiced meats, and guzle down great plenty of Wine, eaſily contract this Diſeaſe. For by this means, the *Chyle* is indigeſted, and indued with very unfit and untameable Particles, and ſo ill prepared in the Bowels; and then from a more liberal drinking of Wine, ſaltiſh ſettlements and heterogeneous feculences or dregs, which ſubſiſt ſomewhere in the firſt paſſages, being too much exalted, are carried into the Blood: to which enormities of living, if a ſedentary life, idleneſs, or ſleeping at noon be added, ſo that the ſuperfluities neither exhale, nor the *Saline* impurities are diſſipated by exerciſe, but left to ſettle about the joints, certainly too much of this *Alchaliſure* ſeed is ſowed for a plentiful harveſt of this Diſeaſe of the *Gout*.

2. Oftentimes acquired, by reaſon of an evil manner of living.

3. The debility of the little joints, and *Gouriſh* diſpoſition is not only hereditary, but excited frequently by reaſon of various occaſions. The falling down of the Morbific matter often induces this: for if by chance it happens, that at firſt, the fit of the *Gout* comes

From what cauſes the debility of the Joynts is excited.

comes in this or that part, afterwards the peccant humor more eaſily falls down into the ſame member; and quickly conſtitutes, as it were, a neſt, where the Eggs may be continually laid up. Beſides, a ſolution or breach of continuity alſo, or ſome hurt inflicted on any joint, by wet, or cold, by a blow, or putting out of joint, oftentimes ſtirrs up the *Goutiſh* diſpoſition.

2. The other foregoing Cauſe of the Gout, from the acetous part of the nervous humour.

Secondly, But indeed, as the Blood brings a *Saline* Mine for the Morbid ſeed, and the Joints receive and hide it readily; yet this proviſion, without the coming of the other ſeeds, is like an addle Egg, wholly barren and unfruitful; becauſe, for the conſtituting of this Diſeaſe into act, it is required, that the nervous liquor, by chance ſwelling up or growing turgid, pours forth *Saline* impurities of another condition, to wit, acetous, falling away with a certain efferveſcency, or heat, and as it were a firing of the other Mine. Wherefore, we think good to ſet down this other foreleading cauſe of the *Gouty* Diſeaſe in the nervous humor, and its acetous or ſharp affluxions, or flowing to the parts.

Such an acetous diſpoſition does not come upon the whole Maſs of the nervous humour, but only ſome portions or recrements of it.

And indeed, that the *Saline* Particles of this Liquor degenerating from a *volatilization* to a flux, do become acid, we have ſhewed by very many inſtances and reaſons; both formerly, and alſo in this Tract. But for the proviſion of this Diſeaſe, it is not requiſite that the whole Maſs of the nervous juice ſhould be acetous; but it is ſufficient, that ſome portions of it in the Brain, or elſewhere in the nervous ſtock, being depraved, or that its Recrements laid up here and there, had contracted this kind of Nature, from which afterwards growing turgid, when as the acid Particles run together to the *Saline* Mine laid up in the Joints, they ſtir up the *Gouty* fit after the manner aforeſaid.

It is ſhewn that acetous fluxions do proceed from the nervous humour.

But truly, it manifeſtly appears, that *acetous fluxions* being brought from the nervous humor, do frequently happen; by a notable inſtance or experiment, often cited by me; *viz.* I have often obſerved, That thoſe obnoxious to the paſſions or pains of the Nerves, have ſuffered or felt a light rigor or ſtiffneſs in their whole Body (which is a corrugation or wrinkling of almoſt all the nervous parts) and then preſently, the Convulſive Diſtemper would follow; at which time the Urine was rendred very copiouſly and clear, which being without any lixivial or nitrous ſavour (which otherwiſe it always has) was very ſharp, like mere Vinegar: indeed by this moſt clear ſign it appears, that the humor being riſen up to a fulneſs in the nervous parts, and moved by its ſwelling up, doth bring in the Convulſive Diſtempers; and when a portion of the ſame ſweating or dropping forth, is laid up in the *Glandulæ*, immediately being reduced thence into the Blood, by the paſſage of the Veins and *Lymphæducts*, it did excite the flood of the ſharp Urine: Indeed in like manner, from the ſame humor ſwelling up in a leſſer meaſure, and ſtill remaining within the nervous paſſages, and ſetling in the Joints, we think the *Gouty* fits do ariſe.

And ſo part of the Gouty Mine is ſent from the Brain and Nerves.

Indeed it is an argument, that part of the *Goutiſh* matter doth proceed from the Brain and Nerves, becauſe for the moſt part, thoſe obnoxious to this Diſeaſe, do complain a little before the fit, of an heavineſs of the head, and of a dulneſs, with a *Vertige*, and ſleepineſs; but as ſoon as they begin to ſuffer the pains of the *Gout*, as if the Clouds were blown away from the Brain, they enjoy a more free underſtanding, with a great and unwonted ſharpneſs of wit. Beſides, when as there are ſometimes many *Saline* Mines of this inveterate Diſeaſe, depoſited in diverſe Members, it is obſerved, that the pains do very much invade, firſt the ſuperior places, and then by degrees deſcend to the reſt; wherefore, when perhaps at firſt the *Vertebræ* of the neck were troubled, a little while after the ſhoulders, or other members of the Arm were poſſeſſed, then the Diſeaſe reached to the Loins, or the Hips, and laſtly the joints of the Legs, and ſo to the loweſt joints, ſometimes theſe, and ſometimes thoſe.

The evident Cauſes of the Goutiſh Fit.

The *Evident Cauſes*, which in reſpect of the nervous liquor ſtir up the *Gouty* Fits, do either pervert the Particles and portions into an Acetouſneſs, or elſe ſtir them up before degenerated into Fluxions.

1. The drinking of ſharp Liquors.

1. Acid liquors, as thin Wines, Cyder, ſtale Beer (experience being miſtreſs) are to be ſhunned by *Gouty* perſons, more than a Mad-Dog, or a Snake. For theſe kind of Drinks do not only bring into act the cauſe of this Diſeaſe, but contribute more Acetous Particles, (by carrying them to the Brain, and nervous Fibres) to its neſt, and increaſe the Morbific matter.

2. Immoderate Exerciſe.

2. Immoderate or unſeaſonable exerciſes of the Body, violent paſſions, immoderate Venus, and a diſorderly feeding, and whatſoever beſides greatly diſturbs the ſpirits and humors or ſhakes them, and by that means ſtir up the fluxions of the nervous juice or its recrements, induce the pains of the *Gout*.

3. Evacuations being ſuppreſſed.

3. Uſual evacuations being ſuppreſſed, alſo taking of cold and wet, for that by this means the blood, and by conſequence the nervous liquor, conceive efferveſcencies and fluxions, do bring on the fits of this Diſeaſe.

4. For

4. For the ſame reaſon, the changes of the Heaven and of the Air, as alſo the *Tropicks* of the year, are wont to bring on the pains of the *Gout*; ſo that it is become a Proverb, That *Gouty* perſons carry their *Almanack* in their joints; and deduce moſt certain *Prognoſticks* of the weather, from their pains: For as often as the humid conſtitution of the year, or the blowing of the Southern, or the Northern Winds, or Snow, are at hand, they are wont to predict theſe from the coming of their pains. Further, every Quarter of the Year, eſpecially Spring and Fall, they are more grievouſly tormented. Wherefore the *Æquinoxes* are always religiouſly obſerved by them. The reaſon of theſe conſiſts partly in this, foraſmuch as inſenſible perſpiration is variouſly altered, by reaſon of the mutations of the Air and Year; therefore the Effluvia's which are wont to tranſpire, being reſtrained, do ferment the Blood and the nervous Humor, and eaſily ſtir them up into *Gouty* Fluxions. Beſides, the humors of our Bodies, even as the Sap of Vegetables, and other natural and artificial Liquors do diverſly grow hot, about the changing of times, and enter various ſtates or conditions of either fixation, or ſometimes of volatileneſs, or of a flux. *4. The Circulations of the Heaven, Air and Year.*

The chief differences of this Diſeaſe, are taken from the diſtemper'd places, and ſo there are ordained as it were diſtinct *ſpecies* of the ſame, to wit, the *Chiragra* or Hand *Gout*, the *Iſchia* or Hip *Gout*, the *Gonagra* or Knee *Gout*, and the *Podagra* the Foot or Toe *Gout*; in the mean time, pains are wont to be excited in ſome other members, and are noted by the common name of the *Gout*. Whether the pains of the Teeth, or of the Loins, and pains of other parts ought to be referred hither, we have not now leaſure to inquire. *The differences of the Gout.* 1. *As to the places affected.*

This Diſtemper, as to its original, is ſaid to be hereditary, or acquired; as to the temperament of the ſick, it is Hot or Cold, or *Sanguine*, *Cholerick*, or *Phlegmatick*, to wit, becauſe the Blood being hindred in its circuit, about the diſtemper'd places, ſometimes an Inflammation, or a watry ſwelling come upon the pains. 2. *As to its Original.*

As to the relation of other Diſeaſes, the Diſtemper of the *Gout* is either ſingular, or elſe complicated with other Diſeaſes, and chiefly with the *Scurvey*, or the Stone. Of which kind of combinations, becauſe they are intimate and frequent (as if they were of kin to this Diſeaſe) it will ſeem to the purpoſe, for us to inquire into the reaſons. 1. *In reſpect of other Diſeaſes.*

A long *Gout* oftentimes gets to it the *Scurvey*, and ſome *Scorbutick* Diſtempers are ſo like the *Gout*, that they are not eaſily diſtinguiſhed. The reaſon of the former is, both the like *Dyſcraſie* of the Blood in either Diſtemper, depending upon a fixed Salt, as alſo for that *Gouty* people, being for a long time fixed either to their Bed or Chair, the *Scorbutick* diſpoſition eaſily comes upon them. Secondly, The *Scorbutick* Diſtempers which imitate the *Gout* are the *Rheumatiſm*, and the wandring *Scorbutick* Gout; the reaſons and cauſes of which, and how they may be diſcerned from the *Gout*, we need not repeat here, having already delivered them in our tract of the *Scurvey*. *It is wont to be complicated with the Scurvy.*

The *Gout* hath ſo near a relation to the *Stone*, or *Gravel* in the Reins, that either diſtemper, as if they had the ſame original, moſt often meet together; for ſcarce any is ſick of the *Gout*, but is found to be alſo obnoxious to the other Diſeaſe. Further, an inveterate *Gout* is wont to excite ſtony Concretions in the Joints, ſuch as the *Stone* doth in the Reins. Hence I think it is moſt likely, that the *Stone* or Gravel in the Reins, doth ariſe from a like, if not wholly the ſame cauſe, that we aſſigned for the *Gout*, to wit, the Saline fixed matter, being depoſited from the Blood, in the Reins, doth grow hot with the acid humor, being there poured forth thorow the nervous paſſages, and by that means doth frequently induce *Nephritick* pains, or of the Reins; then, from either matter being coagulated, after growing hot, doth form the Stone. For the illuſtrating this *Pathology* farther, (here being no place for it) it ſhall be deferred to another time. 2. *With the Stone.* *The Reaſon of this is ſhewed.*

Every Body is wont to give a *Prognoſtick* of the *Gout*, to wit, that it is ſafe enough, but moſt hard to be Cured. 1. As to the former, this Diſtemper is not only free of it ſelf from danger, but on the contrary, preventeth moſt other Diſeaſes. For *Gouty* people, by reaſon of the *Saline* fixed *Dyſcraſie* of the Blood, are little obnoxious to *Feavours*; but for the moſt part live free from a Conſumption, and other more grievous Diſtempers of the Bowels or Head; becauſe the Recrements of the Blood and nervous Juice are continually laid up in the Joints. 2. But as to the latter, the ſo great difficulty of Cure, the reaſon is, that for the taking away the foregoing cauſe of this Diſeaſe, there is required a moſt perfect amendment, of a double Humor, *viz.* of the Blood and nervous Juice; to wit, that they may beget no *Saline* fixed or plainly acid Particles; and moreover, a reſtitution of the weakned Joints; neither of which can ever be eaſily obtained. And beſides this, it happens, that the Conjunct Cauſe of this Diſeaſe ſubſiſts in places greatly at a diſtance, ſo that the virtues of no Medicine are able to reach them. *The Prognoſtick of this Diſeaſe.*

The Gouty Matter being restrained, or any other way translated, oftentimes excites dangerous Distempers.

Sometimes it happens, by reason of the fluxions of the *Gouty* Matter, being suppressed or beat back, that sometimes torments of the Ventricle, of the Bowels, and of the Belly, sometimes a straitness of breathing, an *Asthma*, or other Distempers of the Breast, and sometimes also an *Apoplexy*, and other sleepy, or Convulsive Diseases are excited; which being observed, it may be objected, that the Mine of the *Gout* is not the same as we but now described: because its *Saline* part, if it were the same which is destinated for the nourishing of the joints, would not be from thence expelled or deferred, or laid up elsewhere; then as to the other part, to wit, the laying up of the acid seeds in the accustomed place, it seems that it should not be easily repercussed, or of it self suppressed in its way, or any where else translated, to be very hurtful to any part. But indeed, it is easie to reply to this, that an acetous portion of the *Gouty* Matter, may be repelled or suppressed, flowing thorow the nervous passages, and so it being poured into other parts, doth oftentimes excite most grievous evils. Indeed the nervous Liquor and its Recrements, for that they consist of very subtil and active Particles, upon every light stop or repulse, are driven into diverse deflections and flowings; moreover, when these grow turgid, or meet with the Particles of humors of another kind, and grow hot with them, they stir up various Distempers, or such as are painful and Convulsive; and not rarely, because the dissimilar Particles are mutually congulated, sometimes *Strumæ*, sometimes *Cancres*, or otherways malignant Tumors arise. Instances very remarkable of these kind of effects, we have shewn in our Treatise of *Convulsive Diseases*; But especially concerning a Maid, who by reason of the *Inguinal Glandules*, or the Kirnels about the Groin, being hardly pressed and hurt with a Truss for a Rupture, fell into a *Vertigo*, and Convulsive Distempers, and shortly after had great *Scrophulæ* or running Sores, growing on the same side, in the Neck. After the same manner, by reason of the *Gouty* Mine being restrained from its wonted place, and suppressed within the nervous Passages, or otherways translated sometimes most wicked Distempers arise.

The acetous recrements of the nervous Liquor do chiefly effect this.

The first Instance of such an Effect.

A second Instance.

Whilst I was writing these, I was sent for to a Noble Matron, who sometimes past being obnoxious to the *Gout*, and that very much, after about three months last past, she had laboured almost continually with a languishing of the Ventricle, with a queasiness, nauseousness, and vomiting; at length, I know not upon what occasion, falling into frequent swoonings or loss of spirits, a little after she was troubled with a *Vertigo*, with a loss of memory, and sometimes with a light *Delirium*; and when she had continued thus for some days, and free in the mean time from the *Gout*, and growing well in her stomach, she eat with an appetite broth twice or thrice in a day, and once a day flesh meat, and digested it without any trouble: by this manifest sign indeed it appears, that the Recrements of the nervous humor, which were wont before to fall down by the *Spinal* Nerves into the Feet, to the Mine of the *Gout*, afterwards being deposited in the *Ventricle*, thorow the Nerves of the wandring pair, and the *Intercostals*, did stir up the continual troubles in it; which at last partly restagnating in the Brain, and being partly translated into the *Cardiack* Nerves, (or those going to the Heart) those last Distempers of Swooning, of the *Vertigo*, and the *Delirium* succeeded.

The Cure.

The *Curatory* method suggests three primary *Indications*, the first of them *Curatory*, to be administer'd only in the Fits, for the allaying the pains, and for the sooner ending of them. Secondly, *Præservatory*, being destinated for the intervals of the fits, endeavours the taking away of the foregoing cause of the Disease, that the fits of the pains may more rarely, or less, or not at all be repeated. Thirdly, *Vital*, which institutes, by what kind of food, and by what Remedies, strength may be sustained in the cruel Torments, and life be prolonged, and also refreshed or cherished, notwithstanding the frequent and almost continual troubles of the Disease.

Three primary Indications.

1. Curatory, for the allaying the pains in the Fits.

1. The first *Indication*, to wit, the allaying of the pains, contains these two chief intentions, to wit, that the breach of the unity be taken away; and in the mean time, that the irritation, or the growing hot of the Fibres, or of the Spirits flowing in them, may be quieted or appeased.

1. For the taking away of the Breach of the Continuity.

1. For the taking away of the breach of the unity in the distemper'd places, both the flowings of the humors, which are apt to tend thither, ought to be hindred, and the Mine already impacted to be dissipated, and shaken off, and its Particles suppressed, from their mutual effervescencies or growing hot. For these endeavours destinated, evacuating and altering Remedies, and of either both internal and external. We shall here add some forms of these, and the more select ways of administration, in their order.

Phlebotomy.

Phlebotomy or letting of Blood, in a fresh *Gout*, or not very inveterate, and especially in a more hot constitution, being used about the beginning of the Disease, doth often bring help; but in an habitual Disease, and in a frigid temperament, and old age, it

is

is wont to be more hurtful than profitable; because it depresses the vigor of the Blood, and of the Spirits, not too much raging, without a lessening of the Morbific matter.

Purging. The business is very much controverted concerning Purging about the beginning of the Disease, whilst some *Physicians* most strictly abstain from all Purging, before the declination or end of the fit; others on the contrary, constantly give strong Purges about the beginning of the Disease, and oftentimes with good success. The reason of the difference seems to be placed chiefly in this, to wit, because some *Gouty* persons are yet firm in the constitution and tone of the humors, and the Vessels containing them, and being not yet weakned in their joints, as often as the Blood and nervous Liquor are disturbed by Medicines, their superfluities and recrements are not presently precipitated into the Mine of this Disease, yea these being provoked by the Medicine, and also obeying the incitement, are drawn forth by the mouths of the Arteries, into the cavities of the *Intestines*; and in the mean time, the Vessels being emptied, they draw or sup back a certain part of the Morbific Matter. But it is otherwise in tender and weak Constitutions, for from the least commotion of the Medicine, the purgings of either humor fall down into the *Gouty* place. Therefore to whom Purging is convenient, it ought to be instituted with the more strong Medicines, and *Elaterium*. For this matter, these are of known use. The Electuary *Caryocostinum*. The Purging Syrup *de Ramis*. Pills of *Hermodactyls*. The Compounded Pill *ex Duobus*. The Pill of *Rhasis*; which if we may believe the Author, will quickly make the sick to walk. Take *of the best Aloes half an ounce, of red Roses two scruples, of Hermodactils barkt one dram and a half, of Diagridium one dram, of Honey of Roses what will suffice; make a Pill.* Roderick of *Fonseca*, wonderfully crys up the root of black Hellebore, and among other things, an Apple with its small strings put into it, to about half a dram, roasted under the ashes, and so eaten.

Forms of Purgets.

Take *of Calomelanos one scruple, of the Resine of Jalap three grains, or of Scammony three grains, of the Oyl of Cloves one grain, of the Balsom of Peru what will suffice; make three or four Pills, for one Dose.*

In the time of Purging, it will be of some moment, perhaps, as *Solenander* advises, to restrain the falling down of the humors into those places, by a Plaster, or other defensive Medicine, laid upon the distemper'd places.

Vomiting. Vomiting, to whom it is wont to be safe and easie, may be also convenient in this Disease; for which end, the *Emetick Tartar* of *Mynsicht*, the *Sulphur* of *Antimony*, or its *Flowers*, *Mercurius Vitæ*, *Vinum Emeticum*, *Gambogia*, may be administer'd.

Altering Medicines, or such as preserve from the Gout. But in the *Goutish* fit, the Powders of Stones, Bones, and Shells, as also of sharp Vegetables, do help; which being called the *Alexiteria* of this Disease, subjugate all the Particles, and by growing hot with them, do as it were mortifie them, and at last they being overcome, they carry them forth either by Urine or Sweat.

Pills. Take *of the Powder of Crabs claws compounded two drams, of Ivory, of the Root of Cretick Dittany, of the Root of male Pœony, each one dram; of the Wood of Aloes, of yellow Saunders, each half a dram; make a Powder, let it be taken half a dram or a dram, either by it self, in a spoonful of red Poppy Water, drinking after it six spoonfuls of the same, or let it be reduced into a Bolus, or Pills, with Andromach Treacle, or Venice Turpentine what will suffice: the Dose one dram twice a day, drinking after it of the distilled Water afterwards described two or three ounces.*

An Electuary. Or Take *of the same Powder six drams; of the Conserves of Gilliflowers, and of Betony, each one ounce and a half; of Diascordium one dram, of the Syrup of Poppies what will suffice; make an Electuary: the Dose one dram to two, Evening and Morning.*

In the mean time, while these things are doing, besides, altering Medicines, and allaying, have their turns, for the calling away to some other place, the flowing of the Morbific matter into the places distemper'd, or for the carrying it forth; such as may allay the swelling up of the Blood, and the nervous Juice, and stop the Fluxions of the Recrements falling from them; for this end a slender diet, and spoon meat (if it be convenient) being ordered; let *Emulsions*, *Julips*, and *Apozems* made of gentle things, and *Anodynes*, be prescribed.

a. The Spirits ought to be allayed, or quieted. As to what belongs to the other intentions of healing, *viz.* the Discussion of the impacted Mine, and for the allaying the burning or growing hot of the Fibres and the Spirits; this latter must be endeavoured, without which, being performed, the other intention will not satisfie: for this end therefore it is expedient, to give both external Medicines, *viz. Topicks* of a various kind; as also internal, *viz. Hypnoticks*.

1. By Topick Remedies. For that there are an immense company of *Topicks*, these are only *Anodynes*, which respect

ſpect only the pain by it ſelf, or are ſuch as aim at this together, and the tumor; or they are repelling, or reſolving, and diſcuſſing: There are various *Formula's* of every one of theſe, and ways of adminiſtrations: But the chief in uſe are *Fomentations*, *Pulteſſes*, and *Plaſters*; of theſe we ſhall ſhew the moſt celebrious; and firſt of all, *Anodyne* Applications, which pleaſe the Fibres with a certain delight. For this uſe the moſt common practice with the vulgar are, *Cataplaſms* or Pulteſſes of Milk and crums of Bread, or of thoſe with a *Muccage*, or jelly of the leaves and of the roots of Mallows, and Marſh-mallowes, and ſuch like.

Pulteſſes.

Others praiſe a Pulteſſe of the freſh dung of a Cow applied warm.

A Fomentation. Take *of the Water of Nightſhade, and of the Sperm of Frogs, each ſix ounces; mingle them: Lint being dipt in this, let it be applied warm.*

Take *of red Lead three ounces, of diſtilled Vinegar one quart; let them digeſt for ſeveral days; and uſe this liquor by it ſelf, or elſe the water drawn of by diſtillation.*

Alſo a *Water* diſtilled, made of a *Tincture* of *Verdigriſe*, diſtilled in *Vinegar*, often times allays the pains.

I had from a Gentleman, oftentimes heavily obnoxious to the *Gout*, that he in the moſt cruel torments of this Diſeaſe, had always preſent eaſe, from a Fomentation, of the water diſtilled from the contents in the ſtomach of an Ox freſh killed.

Outward Narcoticks. For the extream torments of the *Gout*, outward *Narcoticks* ought ſometimes to be applied. Take *of the leaves of Henbane, and of Hemlock, each three handfuls; let them be put into boiling water, and as ſoon as they grow tender let them be taken out:* Theſe being bruiſed, add to them, *of the Powder of Chamomel flowers about two drams, and the yoalk of one Egg; make a Poulteſſe.*

Or take *of the Tincture of Saffron, made in the Spirit of Wine four ounces, of Camphor, of Opium, each one dram; let them digeſt cloſe ſhut and warm, till they are diſſolved*; anoint the pained part with this liquor. There are to be found other innumerable Medicines of this ſort in Medical Books, and are every where ordinary, and wont to be preſcribed almoſt by every vulgar perſon; which alſo ſuffices for the fulfilling of the other Intention, to wit, the repercuſſion of the Humors, when it is ſeen neceſſary.

Reſolving Topicks conſiſting chiefly of Saline Particles, even analogic, or correſpondent to the Morbific Mine. As to what reſpects *Reſolving* and *Diſcuſſing Topicks*, they are not required to be of the ſame kind, which open only the Pores, and evaporate the *Serum*, and make the Blood circulate, as in an Inflammation, or a white hard ſwelling; but whoſe *Saline* Particles, being deſtinated for the oppoſing thoſe Salts of the *Goutiſh* Mine, may either by embracing them carry them forth of doors, or by precipitating them may ſuppreſs them from their painful heats. Wherefore in this Diſeaſe, when Fomentations or Pulteſſes of *Chamomel*, *Mallows*, *Marſh-mallows*, *Line* and *Fenegreek* ſeeds, bring little or no help; yea by looſning the nervous parts, do oftentimes much hurt; the Salt of *Armoniack*, or Sea Salt, or *Nitre*, or of *Vitriol*, quick Lime, and diſſolutions of the like, or diſtilled Liquors, always troubleſome to other humors or pains, are wont to give the greateſt help.

Forms of theſe. Theſe kind of Liquors in the *Goutiſh* Fits, to be applied to the grieved part, are variouſly preſcribed, by *Quercitan*, *Collins*, *Hartman*, and other *Chymiſts*; and as other famous *Phyſicians* have often found them by experience good, and approved of them, we may conclude that they are helpful for the aforeſaid reaſon.

There will be no need here to repeat the forms of theſe, though I could eaſily ſet down many other preparations of this ſort; yet I ſhall here give you one or two of them only.

Take *of Sal Tartari, and Armoniac powdered, each two ounces; put them into rain or ſpring water two quarts, and with a linnen cloth dipt in it warm, apply it.*

Take *of the Spirits of Vitriol not rectified one pint, of Sea Salt calcined and powdered one pound; diſtil them in a Glaſs retort in ſand; a very pure Spirit of Salt will come forth, which being expulſed from its lodging by a Vitriolick Stagma, leaving the poſſeſſion, eaſily aſcends: To the dead head pour two pints of the Spirit of Wine, digeſt it cloſe and warm, adding of Camphor two drams; let it be applied warm to the grieved part with linnen rags.*

Take *of the Filings of Iron, of the Flowers of Sal Armoniack, each ſix ounces; mingle them well by pounding them together; let it be diſtilled in a Glaſs retort till the Flowers are ſublimated; to the Caput Mortuum being pounded, pour the Spirits of Wine, digeſt it, and keep it for uſe.*

I have

I have heard of ſome that for the allaying of the pains of the *Gout*, have incloſed the diſtempered foot in a little Bay, filled with Sea Salt calcined and powdered; from which they have ſtill expected a certain and ſudden help.

Plaſters in the declination of the Fit.

In the declination of the Fit, for the ſtrengthening the part, and for the ſhaking off the reliques of the Morbific matter, Plaſters are profitably applied; which however are not all convenient to all, but for ſome more, for others leſs hot; But the moſt efficacious to moſt people are thoſe in which are *Red Lead*, *Ceruſe*, and *Soap*, boiled with *Oyl*. Or Take *of the Plaſter of Red Lead two parts, of Paracelſus one part, mix them, and ſpread them upon Leather.*

Opiates.

2. Internal Remedies for the pains of the *Gout*, that are made uſe of, are only *Narcoticks*, or ſuch as ſtupefie, which ſought to be adminiſter'd in cruel and long torments. Of theſe we ſhall chiefly commend Preparations of *Opium*, with *Salt* of *Tartar* or its *Tincture*. Further, for this uſe, the *Laudanum* of *Paracelſus*, or that of *London*, Pills of *Styrax*, and *Cynogloſs*, or Dogs Tongue, Syrup *de Meconio*, or of Poppies, *Treacle Andromach*, and *Diaſcordium*, are wont to be helpful or give eaſe.

2. The preſervatory Indication, out of the Fit.

The Indication *Preſervatory*, or ſo called, reſpects the taking away of the foregoing cauſes of the *Gout*; wherefore, that the fits of pains may more rarely, or leſs or not at all infeſt them: For this end, *Evacuating*, *Altering*, and *Corroborating* Remedies, together with an exact dyet, are preſcribed to be given out of the Fits.

Uſual Purging and Vomiting.

1. *Gouty* people therefore ought conſtantly to be purged Spring and Fall; and then alſo it will be expedient to Vomit, if nothing gainſays it; and ſometimes afterwards at intervals, to repeat them. Let thoſe who are indued with a more ſtrong ſtomach and *Præcordia*, take Emetick Minerals prepared out of *Antimony* or *Mercury*. Thoſe who are of a more tender conſtitution, may take after the eating of ſlippery meats, Wine of *Squills*, or the Salt of *Vitriol* with Poſſet-drink; and then the ſtomach being filled with warm water, or ſimple Poſſet-drink, or with the leaves of *Carduus* boiled in it, let Vomiting be twice or thrice or oftner provoked. For Purging to be often celebrated alſo at convenient times, between, the forms of purging Medicines already preſcribed are convenient enough. Or Take *of the ſtrings of black Hellebore cleanſed one ounce, of Lignum Aloes and of Cloves, each two drams, bruiſe them, and pour to them of the Spirits of Wine, not rectified, one quart; let them digeſt warm and cloſe ſhut, for ſeveral days.* The Doſe two or three ſpoonfuls in the morning, twice or thrice in a week; and let Vomiting and Purging be always begun before the *Æquinoxes*, leſt perhaps the Fit being firſt begun ſhould pervert the courſe of the Medicine.

Phlebotomy.

Letting of Blood, or the opening of the *Hemorrhoidal* Veſſels, are ſometimes convenient Spring or Fall, in an hot temperament, and for ſuch as are indued with a more ſharp Blood. *Cauteries*, made in the Arms, and between the ſhoulders, are profitable to every one almoſt obnoxious to this Diſeaſe.

Altering Medicines called Antidotes of the Gout.

But beſides, altering Medicines, *Antidotes* ſo called by the Ancients, againſt the *Gout*, are of known uſe; and in a long time, together with an exact method or Government concerning the ſix *non-naturals*, often bring great help; in this rank the chief are Medicines indued with a *Volatile Salt*, and *Balſamick Sulphur*, foraſmuch as theſe exalt the fixed Salt, and reduce what is *Acetous*; beſides, bitter and aſtringent things, as theſe Herbs, *Chamepitys*, *Centaury*, *Germander*, the Roots of *Gentian*, and *Ariſtolochia*, or *Birthwort*, *&c.* (as by experience has been approved of in this Diſeaſe) for this reaſon ſeem to be profitable; becauſe they help the offices of *Concoction*, and *Chylification*, or making of *Chyle*; and reſtrain the *Saline fixed feculencies* or dregs, that they may not be carried into the Blood. We ſhall here ſet down ſome forms of each of them.

Pills.

Take *of the Powder of Chamepitys ſix drams, of Crabs Eyes two drams, of Venice Turpentine what will ſuffice, make ſmall Pills, take three or four Morning and Evening, for thirty or forty days, drinking after them of the following diſtilled water two or three ounces.*

A Diſtilled Water.

Take *of the leaves of Cypreſs Tree, of the Aſh, and of Miſleto of the Apple tree, each ſix handfuls; of the roots of ſweet ſmelling Avens, Burdock, each one pound, the outer rinds of ten Oranges, and of ſix Lemons, of Nutmegs, and Mace, each one ounce; let them be all cut and bruiſed, and pour to them ſeven pints of new Milk, and of Malaga one pint; let them be diſtilled according to art, and the whole liquor mixed together.*

Or let there be a ſimple Water prepared of the leaves of Burdock, by pouring it twice or thrice upon freſh leaves.

Take *of the Powder of the Seeds of Burdock ſix drams, of Crabs Eyes two drams, of Nutmeg half a dram, of Capive Balſom what will ſuffice to make a Maſs, which form into ſmall Pills; let four be taken Evening and Morning for many days.*

Tinctures.

Take *of the Tincture of Antimony one ounce; the Doſe twenty drops to twenty five, Evening and Mornings, with three ounces of the water but now deſcribed.*

For

Powders.

For poor people I was wont to preſcribe after this manner. Take *of the Powder of the leaves of Sage half a pound, of Crabs Eyes, and of the Sugar of Cryſtal, each two ounces; mix them; let it be kept in a Glaſs, and take one ſpoonful twice in a day, with a draught of a Decoction of the leaves of Sage, or of the roots of the Burdock.*

Or of the Powder of Dorncrellius preſcribed to be taken after the ſame manner.

Take *of the Powder of the leaves of Germander, of Gout Ivy, of the leſſer Centaury, of Marjoram, of Sage, of Betony, of the roots of Gentian, and of round Birthwort, each one ounce; of Sugar one pound; mix them and make a Powder.*

Or of the Powder of John Anglicus, *called by himſelf Saracenick.*

Take *of the Powder of the leaves of Chamæpitys, one ounce, the bones of a Mans foot burnt two drams, of Liquoriſh three drams, mix them.*

Medicated Beer.

For ordinary drink, let there be prepared a *Bochet* of *Sarſaparilla*, of *Saunders*, wood of *Rhodium*, ſhavings of *Ivory*, *Harts-horn*, *&c.* or let there be prepared *ſmall Ale*, in a Veſſel holding about four gallons, inſtead of *Hops* let their be boiled the leaves of *Germander* and *Chamæpitys*, and after it has work'd, put into it of the leaves of dry *Sage* four handfuls, of *Saſſaphras* two ounces, of the roots of ſweet ſmelling *Avens* eight ounces.

A Milk Diet.

Among *Altering* Medicines a *Milk dyet* has not the laſt place, that the Patient ſhould uſe for three or four Months, no other food: let him drink Morning and Evening new Milk from the Cow; about noon, and at other times, let him eat white Bread boiled in Barly, or Water-gruel of Oatmeal: I have known ſome by this kind of dyet to have received notable help; but others, to have received much hurt or to grow worſe, by the uſe of Milk, and the *Gout* being nothing cured, to have contracted great obſtructions of the *Viſcera*, and a *Cachochimical* diſpoſition or fulneſs of evil humors. Therefore this method is not raſhly to be entered upon, without the counſel of a prudent *Phyſician*, and by a ſedulous obſervation, whether it be convenient or not.

Drinking of ones own Urine.

Of late it has been a common cuſtom, for people having the *Gout*, to drink every Morning their own Urine; which I know has been beneficial to ſome. The reaſon of which help ſeems to be, becauſe the *Saline Latex* of the *Urine*, paſſing thorow the Blood, doth carry with it to the Reins, the *Saline fixed* Particles that were before wont to be carried into the joints. Wherefore, this method, when it is helpful to the diſtemper of the *Gout*, for the moſt part encreaſes the *Stone*: which I think ſufficiently appears from the following Hiſtory.

A notable Hiſtory of the Stone converted into the Gout, and on the contrary of the Gout into the Stone.

A very Learned and Pious Man of this Nation, and alſo the glory of Learned Men Dr. *H. H.* after he had lived for many years, grievouſly obnoxious to frequent fits of pains, of Vomiting, and a making of bloody Urine, at length by the conſtant uſe of the following Remedies, he lived above ſeven years almoſt free from the *Stone*, and without any grievous Fit. The method of Cure which had been taught him by a certain Gentleman, was after this manner, without any *Phyſick* or medicine, abſtaining from Wine and Cyder, he drank for his ordinary drink ſmall Ale, made of Oaten Malt; further, once in a week in the Morning, he took a draught of the ſame Ale, to about a pint, with the Powder of ſmall old rotten Bones three ſpoonfuls diſſolved in it: By the uſe of theſe, within a few months he ſeemed to be in health, and freed from the *Stone*, but ſhortly after he began to be ſick of the *Gout*, and was infeſted with moſt grievous Fits of it, all the time he was free from the *Stone*; and at length upon every light occaſion, was become ſo obnoxious to them, that preſently after feeding, if he exerciſed either his body or mind, by walking or ſtudy, he moſt certainly expected the Fits of his pains. The reaſon of which was, becauſe the Blood being filled to a plenitude with *Saline* fixed Particles, and the nervous Liquor ſtill with *Acetous*, when being inciſed, and alſo poured forth on the freſh nutritious juice, they grew turgid, preſently they depoſed their ſuperfluities, *viz.* the Morbific matter of either kind, into the very weak Joints.

This venerable perſon therefore, being tyred out with ſo frequent and almoſt continual torture, by the counſel of a certain Friend, drank every morning of his own Urine, by the uſe of which, within a month or two, he was leſs tormented with the *goutiſh* Fits, but with an evil turn, the Diſtemper of the Stone began to grow again upon him, for he was from thence troubled with a pain about his Loins, with Vomiting, and a pain in making water, and a little after a total ſuppreſſion of Urine followed, which being not to be helped by any Remedies, in about a fortnights time this Reverend Gentleman dyed.

The reaſon of this ſhewed by Anatomical Obſervation.

The Carcaſe being opened, all the *Viſcera*, except the Reins appeared moſt ſound and firm, but the right Kidney was almoſt conſumed, a ſmall heap of the *Glandula's* being only left, all the Veſſels and the *Ureter* being joined together, and wholly ſhut up,

ſo

ſo that no Urine at all had paſſed there of a long time: The left Kidney being large enough, contained within the cavity and its paſſages, a great heap of Sand or Gravel, and little Stones; beſides there was a round hard and whitiſh ſtone fallen into the *Ureter*, three inches deep, and there fixed, and had wholly ſhut out the paſſage of the water; the *Membrane* of the *Ureter*, where the Stone ſtuck, was become ſo thick and callous, and ſo free from pain, that here it could by no means be moved either upwards or downwards.

It ſeems in this caſe, that when the coagulated Particles of the Blood and nervous juice, to wit, the *Saline fixed* and the *Acetous*, meeting together at firſt in the Reins, did ſtir up for a while the Diſtemper of the *Stone*; afterwards, by the uſe of the above-ſaid Powder, the *ſaline* Particles being ſtill thruſt forward into the habit of the Body, and not eaſily rendred, heaped together the *Gouti ſh* ſeed plot in the Joints, the Reins being in the mean time free. But at length, when by the drinking of his own Urine, the *ſaline* Mine was brought back into the Reins, the Diſeaſe of the *Gout* was changed into the mortal Diſeaſe of the *Stone*.

CHAP. XV.

Of the Colick Paſſion.

Why the Colick is counted among the Diſtempers of the Brain, and the nervous Stock.

IT has been mentioned in the former Chapter, by what right we have referred this Diſeaſe among the Diſtempers of the Brain and nervous Stock, to wit, both in reſpect of the *Symptoms* urging, which are pain, and Convulſive motions, as alſo from the reaſon of the cauſe, by *Charles Piſo* placed in the head, and truly not improbably.

From whence the denomination.

Concerning the word *Colick*, from the *Inteſtine* called the *Colon*, we ſhall not ſtrive, for that it is ſuppoſed, though wrongfully, to be chiefly affected in this Diſeaſe. The Diſtemper may be deſcribed, That it is an hauling or notable pulling of ſome parts of the *Abdomen* or the Belly; from whence a very acute pain ariſes, and with it for the moſt part, a Vomiting, as alſo Convulſions, and Contractions almoſt of the whole *Viſcera* of the Belly, are wont to be joined. And for that the Navil, and its neighbouring parts, are ſometimes as it were with a Perforation, or boring thorow, drawn inwards, and ſometimes ſwell out, with an inflation or blowing up, and as it were with a great leaping forth; the *Inteſtines*, by an inverſe motion of the Fibres, are oftentimes pulled together upwards: wherefore the Belly being extreamly bound together, renders little or nothing; yea although it be often provoked by Clyſters, it doth not eaſily part with its contents: It appears clearly, that the Ventricle, with the *Duodenum*, and the bladder of *Gall*, are in like manner pulled, by Vomiting, and by the caſting forth of great plenty of yellow or green *Choler*: Sometimes the *Ureters*, and the bladder of the Urine, are ſo contracted, that in all the fit, the Urine is wholly ſuppreſſed, or but very ſparingly rendered: Beſides, a *Vertiginous* Diſtemper of the Head, frequently preceeds, or follows the fits of this Diſeaſe: yea, the *Colick* growing worſe, and inveterate, oftentimes cauſes pains in the outward members, and at length ends in the *Palſie*: Therefore, foraſmuch as very many parts are wont to labour in this Diſeaſe, we ſhall inquire, which is primarily affected, and by what means the other ſuffer; then what is the conjunct cauſe of the Diſeaſe, in what place it ſubſiſts, and from whence it draws its original.

A deſcription of the Diſeaſe.

The ſeat of the Diſeaſe is not always, or often in the Inteſtine, or Gut Colon.

As to the part primarily or firſt of all diſtemper'd, though the Diſeaſe being urgent, the whole region of the Belly is wont to be diſturbed, yet its primary ſeat ought to be placed, where the pain chiefly infeſts, and pertinaciouſly ſticks: But this, by the conſent of very many *Phyſicians*, is ſaid to be ſome where in the Gut *Colon*. Wherefore *Celſus* ſaith, *That the Colick is a Diſtemper of the greater Inteſtine*; which alſo reaſon ſeems to perſwade, ſomething; for whether the *Morbific* Matter is ſuppoſed to be heaped up in the Cavities of the Inteſtines, or to be wholly fixed in their Membranes, certainly there are extant deep little Cells in the folds of the *Colon*, for its receptacles, and thick coats of this *Inteſtine*, in which the peccant humor may be deeply faſtned. But indeed this opinion (to which we cannot eaſily aſſent) as alſo the denomination of the Diſtemper, ſeems to have grown in credit in the Schools of the *Phyſicians*, from this only, becauſe we ordinarily obſerve, that the *Inteſtines* enter into pains and torments, being irritated by wind, medicines, *Choler*, and perhaps other humors, contained within their cavities;

viz. neither in its Cavity or Coats.

hence, as it is obvious, may be inferred, that the *Colick* pains do ariſe from the ſharp and provocative contents of the *Inteſtines*, and eſpecially of the *Colon*. But if it were ſo, without doubt, thoſe things which looſen the Belly, and draw forth plentifully the wind, and the dregs or *Faces*, ſhould give certain eaſe; the contrary of which often happens, to wit, by ſome more violent, or often Purging, the Diſeaſe has grown worſe.

Pains commonly taken for Colicks.

Wherefore, that the ſeat of this Diſeaſe, and the nature of it may be truly known, we ought firſt of all to diſtinguiſh here, concerning the torments of the Belly, or pains commonly eſteemed for *Colicks*: to wit, theſe are either meerly occaſional, ariſing from a ſolitary evident cauſe, and ordinarily happen without any previous diſpoſition to ſome men, and eſpecially to thoſe who being of a tender conſtitution, have very ſenſible Fibres, and Spirits quickly diſſipated; after this manner, diſagreeable or unwonted eating or drinking, alſo medicines, taking of cold, and many other alterations about the ſix *non-naturals*, oftentimes excite great perturbations, with pains in the *Viſcera* of the lower part of the Belly: which kind of Diſtemper, ought to be eſteemed, not the Diſeaſe, but only *Symptoms* excited from a manifeſt cauſe.

Theſe are meerly accidental or habitual.

Theſe latter are properly the Diſeaſe.

But beſides, the *Colick* properly ſo called, happens to ſome, not only produced by an accidental cauſe, but falling upon ſome men prediſpoſed by a peculiar right, depends wholly upon a foregoing cauſe ripened by degrees. The more grievous fits of this Diſeaſe, for the moſt part, have their periods, and obſerve the changes of the Air and Year; further, being excited, they do not eaſily give place to any Remedies, nor quickly paſs over; but notwithſtanding the uſe of Fomentations, and though the Belly be taken down very much by *Clyſters*, or Purging, they oftentimes continue with great fierceneſs for many days, and ſometimes weeks. The pains in every fit ſtill repeat the ſame part, and are followed with a concourſe, for the moſt part, of other the like *Symptoms*: But the pains of the *Colick*, though they have not the ſame ſeat in all, but ſometimes exerciſe their cruelties under the *Ventricle*, ſometimes about the *Navel*, or the *Hypochondria*, and ſometimes in the lower part of the Belly, or about the Loins; yet as often as they are repeated in the ſame ſick perſon, they moſtly obſerve the ſame neſt.

The conjunct cauſe of the Diſeaſe are not the Contents of the Inteſtines.

For the unfolding the *Ætiology* of this Diſeaſe, it is not enough to affirm, that the Inteſtines are pulled, either by their ſharp contents, or irritated by the Blood, and other humors poured into them, and breaking the continuity. For as to the former, it is extreamly improbable, that the *Bile*, or *Choler*, or *Phlegm*, or the *Pancreatick* Juice, or any other ſimple humor, or growing hot or fermenting with others, ſhould be able to excite ſuch fixed, cruel, and long continuing pains: Beſides, becauſe the *Inteſtines* being beſmeared with their own dung, cannot be eaſily pricked by the Contents, though ſharp; nor are they wont to be exaſperated by them; inſomuch that the ſharpeſt ſtools, which oftentimes fetch off the skin at the Fundament, very little trouble, or not at all, the paſſages of the Guts; further, theſe being grievouſly provoked, whatever is troubleſome, contained in their cavity, is eaſily ſhaken forth, and either by driving it forward, upwards, or downwards, is quickly thruſt forth; as is plainly perceived in the Diſeaſe of the *Choler*, and other *Dyſentrick* Diſtempers; nor indeed is there almoſt any loading of theſe provoking the Membranes, and ſtirring up pains, which may not be exterminated or carried forth of doors by one purge or other. Then, ſecondly, as to what reſpects the ſuffuſions of the Blood, or *Serum*, within the coats of the *Inteſtines*, by which an Inflammation or painful Tumors are excited; Indeed we grant, that ſometimes it may ſo come to paſs, yea I have known it by ocular inſpection; but from thence we have obſerved, not the *Colick* but the *Iliack* paſſion to have been excited. For when I have opened ſeveral dying of the *Iliack* paſſion, I found almoſt in all, that the cauſe of the Diſeaſe, and of their Death, was an Inflammation or Ulcer of ſome Inteſtine; neither is this any wonder, becauſe a *Solution* of the continuity, in a very tender and highly ſenſible Membrance, doth ſtir up Convulſions, and painful Corrugations or wrinklings together, and ſo continual and cruel; that therefore the *Periſtaltick* motion of the diſtempered Inteſtine, whereby the dung or dregs of the Belly are carried forward toward the *Anum* or Arſe-Gut, ſhould be hindred and wholly inverted.

Not the humors impacted in the Membranes.

The nervous Liquor ſeems moſt of all to contribute to the cauſe of this Diſeaſe.

Therefore, that we may thorowly inquire out both the Matter and Mine, as alſo the ſeats, and the ways of flowing to them, of this Diſeaſe of the *Colick*, by ſome other means; it may deſervedly be ſuſpected, that it is the nervous Juice, and its Recruments; and that the rather, becauſe this paſſion hath ſo intimate an agreement or conſent with the other Diſtempers of the Brain and the nervous Stock, as we have already ſhewed. *Charles Piſo* hath affirmed, That as moſt diſtempers of the whole Body, ſo alſo the pains of the *Colick*, are excited by a *Serous* heap or deluge gathered together in the head; and he contends, that the ſeat of this Diſeaſe, is neither in the coats nor cavities of the *Inteſtines*, but in the *Peritonæum* or inner rim of the Belly, and

that

that the cauſe ſticks wholly in the Brain, near the original of the Nerves. To wit, he ſuppoſes, (which he ſaith he hath found by *Anatomical* obſervation) "The ſeroſities "laid up in the hinder region of the Brain, to beſet the little heads of the Nerves of "the wandring pair, and ſo ſome of the utmoſt branches and ſhoots of them inſerted in- "to the *Peritonæum* or inner rim of the Belly by the Caul, to move into Convulſions; "and from the contraction or drawing together of this, moſt cruel pains, both in it, "and in the underlying *Viſcera*, as it were breaking them to pieces, to be excited. For the proof of this opinion, he brings an example of a certain man diſſected, being dead of a moſt grievous fit of the *Colick*, in whom *the binder region of the head near the Cerebel, was ſo much drowned with a clear water, as alſo the nervous original of the wandring pair, that the marrowy ſubſtance appeared very much moiſtened, like wet Paper*, Sect. 4. Chap. 2. Charles Piſo's *Opinion cited,*

But indeed, though we ſhould grant, that the *Colick* ſhould ariſe from the humor of the Brain, and from the default of that watering the nervous parts; yet we think that this painful paſſion is excited, not after that manner as this *Author* has laid down. Becauſe we think neither the ſeat of this Diſeaſe to ſubſiſt in the *Peritonæum*, nor its primary cauſe to be within the head. For as to this, although the *Morbifick* matter being heaped up in the head, near the origine of the Nerves, doth ſometimes produce in the parts at a great diſtance, Numneſſes, Cramps, and Convulſive motions, as we have elſewhere ſhewn, by many inſtances, with the reaſons of the Diſtemper; yet it is much otherwiſe in a very cruel pain, ſuch as the *Colick* is wont to be: For as to this being excited, which always proceeds from a breach of the continuity, it is required, that the dolorifick cauſe or improportionate object, ſhould be fixed in the diſtemper'd member it ſelf, or at leaſt a certain part or portion of it: Neither is it ſufficient to ſay, that the Convulſion proceeds from a remote cauſe, and ſo the pain from the Convulſions: For although pain oftentimes doth produce Convulſive motions, yet theſe do not produce pain of themſelves, at leaſt great and continuing long. Wherefore in the pain of the *Colick*, the matter drawing aſunder the ſenſitive Fibres, and pulling them one from another, and ſo provoking them into painful Corrugations or wrinklings, doth not ſtill ſtay in the Brain; but deſcending from thence, thorow the nervous paſſages, towards the *Inteſtines*, ſeems to be heaped up ſomewhere in their neighbourhood, nigh to the pained parts, and there either growing turgid or ſwelling up, by reaſon of their fulneſs, or growing hot with ſome other humor, do bring in the fits of this Diſeaſe. *and examined.* *The ſeat of the Morbifick Matter not in the Brain.*

We indeed reject the Mine of the *Colick*, from the *Peritonæum*; becauſe this Membrane being very thin, and gifted but with very few and only ſmall Veſſels, is neither capable of any great affluxions of Humors, neither can it ſelf, though pulled together, be able to urge the *Viſcera* lying under it, into pains, by compreſſing or drawing them together. But the Morbific matter being ſlid down from the Head, by the Nerves, into the Belly, finds very convenient neſts in the *Meſentery*; in which very many and great Nerves have there their noted infoldings and diſtributions: Wherefore, as this part is very ſenſible, and very much obnoxious to the flowings in of the humors of the nervous Stock, it may be deſervedly affirmed to be the ſeat of this Diſeaſe of the *Colick*. *The part primarily affected in the Abdomen, not in the Peritonæum. But more rightly it ſeems to be the Meſentery.*

We have ſhewn formerly, the cauſes of ſome Convulſive motions in the *Abdomen*, which are commonly called *Hyſterical*, to lye hid in the *Meſenterick* Infoldings; moreover, in the ſame places, we did then aſſert, That the *Colick* pains had ſometimes their neſts, and confirmed it ſufficiently by *Anatomical* obſervation. But the matter is ſomething diverſe, and not the ſame, that is wont to excite the ſo different Diſtempers of either, under the ſame roof. In the Paſſions called *Hyſterical*, we have largely declared in a former Treatiſe, That the Animal Spirits being burthened with an *Elaſtick Copula*, are let off, or as it were exploded one from another, and ſo the containing bodies are unwillingly forced into irregular or preternatural Motions. But in the pains of the *Colick*, the ſame Spirits, by reaſon of the matter troubleſome to them, and improportionate, being provoked, and ſo pulled and diſtracted one from another, do put the ſenſible Fibres into very troubleſome Corrugations, or wrinkling themſelves together: By what means this comes to paſs in the pains of the *Colick*, alſo what are the conjunct, and the foregoing cauſes of this Diſeaſe, and the reaſons of the *Symptoms*, we ſhall a little further explain. *Where the ſeat of the Diſtempers called Hyſterical, often lyes hid.*

Therefore we ſhall ſuppoſe, that for a Seed-plot or Mine of the *Colick* Diſtemper, ſome Recrements of the nervous humor being fallen from the Brain, thorow the Nerves, and ſlid down into the *Meſentery*, and other infoldings of the *Abdomen*, are there heaped up; which if they be thick, and very viſcous, ſo that they cannot be received by the *Lymphæducts* or water-carriers, and ſo ſent away, or that they cannot ſweat forth by the ſmall ſhoots of the Veſſels into the cavities of the *Inteſtines*, ſtagnating in thoſe parts, and being by degrees heaped together, do ariſe at length to a provocative *The Colick-mine is affirmed to be within the nervous, and other meſenterick infoldings of the Abdomen.*

fullneſs; then this matter growing more degenerate by ſtanding, and becoming more infeſtous, grows turgid occaſionally, or of its own accord, or perhaps grows hot or ferments with a *Saline fixed* humor, poured forth thither, from the Blood, torments the ſhoots of the Nerves, and the nervous Fibres (of which the *Meſentery* hath an infinite number) with very troubleſome and painful Corrugations; which kind of Diſtemper of theſe, doth not plainly ceaſe, till the hot or Fermentative matter being ſhaken off, or preſſed forth into the cavities of the *Inteſtines*, is at length overcome.

From which, planted thereabouts, the Colick Symptoms are excited.

Further, foraſmuch as from the *Meſentery* and its Infoldings, nervous ſhoots and Fibres are moſt thickly put forth into the bottom of the Ventricle, the bladder of the *Gall*, the *Choledoch* paſſages, all the *Inteſtines*, and on every ſide almoſt into all the *Viſcera* of the whole *Abdomen*; therefore whilſt the *Colick* matter grows hot or ferments in its Mines, it there ſtirs up torments, and oftentimes moſt cruel pains; and together with them in many other Membranous parts Cramps, and Convulſive or painful Contractions, are every where excited. Hence, by reaſon of the *Meſentery* being primarily diſtemper'd, a moſt ſharp pain under the Navil ſhews it ſelf, like as if a ſtake were driven thorow it, or a wimble a boring it; then round about almoſt in the whole *Abdomen* or lower region of the Belly, by reaſon of the *Inteſtines* being variouſly drawn down, or backwards, in diverſe places together, wandring pains run about hither and thither; and by reaſon of the motions of the Fibres being diſturbed or inverted, both in theſe, and alſo in the urinary Veſſels, the Belly is almoſt always bound up, and ſometimes a ſuppreſſion of the Urine, or a rendring but a very little ſucceeds: yea alſo the *Duodenum*, the *Gall*-Bladder, with its paſſages, and the bottom of the Ventricle, being diſtemper'd with a *Spaſm* or Cramp, and their Fibres drawn upwards, from thence frequent Vomiting, with a copious caſting forth of yellow or green Choler, doth infeſt during the fit.

The yellow or green Bile or Choler, that is caſt forth by vomiting, in the Colick-Fits, is not the matrial cauſe of this Diſeaſe.

But ſome do contend that this *Bile* or Choler (which is ſometimes caſt forth as green as a Leek) is the material Cauſe of the Diſeaſe; and that abundance of it dropping or diſtilling forth into the *Viſcera*, doth excite the *Colick* pains in the *Inteſtines*. I ſay, that this humor about the beginning of the fit, is contained without any offence in the Bladder or bag of the Gall; but afterwards by reaſon of the Convulſions of the *Viſcera*, being from thence preſſed forth, and as it were drawn or ſtroked out into the Stomach, it is carried from the diſtemper'd Ventricle by Vomit; but there perhaps meeting with ſome other acid humor, it acquires a greeniſh colour, yea ſometimes a blackiſh (as we have ſometimes found by *Anatomical* obſervation.) And indeed, it appears clear from this, becauſe thoſe who are of a more cold temperament, and beget little *Choler*, when they are ſick of the *Colick*, caſt forth by Vomit little or nothing of the yellow or green *Bile*; and yet they are wont to be vexed with as cruel and ſharp pains as others.

Wherefore pains of the Loins often come upon the Colick pains.

In the fit of the *Colick*, to the pains of the Belly, moſt cruel pains, raging about the Loins, in the bottom of the back, are very often joined; which certainly cannot ariſe from the irritation of any *Inteſtine*. But it may be eaſily conceived, that theſe are excited from the Morbific cauſe implanted in the *Meſentery*; foraſmuch as ſome moſt noted Nerves, belonging to the Loins, enter into the greateſt nervous infolding of the *Meſentery*; hence not only painful Convulſions are delivered by conſent from one part to another; but beſides, it is probable, that ſome Recrements of the Back and Loins, are derived by this paſſage into the *Meſentery*; and in ſome meaſure, for this reaſon *Scorbutical* people are ſo very obnoxious to pains of the Belly, and to a Flux.

In what the foregoing cauſe of this Diſeaſe conſiſts.

Thus much concerning the nature and ſeat of the *Colick*, as alſo of its conjunct cauſe, and of the *Symptoms* of the ſame coming into act: As to what belongs to the foregoing cauſe, it conſiſts chiefly in theſe two things, to wit, firſt of all for that many Recrements are heaped together in the nervous Liquor; and ſecondly, becauſe they being chiefly received from the Nerves, deſtinated to the *Viſcera* of the lower Belly, and brought into the *Meſentery*, conſtitute the Morbid Mines there: 1. The former of theſe happens for the moſt part, from the fault and vice of the Brain; to wit, becauſe this admits together with the nervous liquor, *Heterogeneous* Particles, and infeſtous to the Animal Regiment within its borders; beſides alſo, for that it doth not ſend away preſently theſe and other ordinary Recrements by convenient ſinks: Wherefore, the incongruous matter, when it cannot be otherways carried from the Brain, it moſt eaſily ruſhes into the moſt open Nerves of the wandring pair. And for this Reaſon it is, that Women from every inordination of the Brain, frequently contract the diſpoſition called *Hyſterical*; to wit, becauſe the Recrements of the nervous Liquor, whether they are *Spaſmodick* or Convulſive, and *Elaſtick* or letting off, or painful, or provocative only, being more apt to be depoſed into the wandring pair, ſo ordinarily excite Convulſive *Symptoms*, like to the *Colick*. 2. Becauſe this matter running into the pair of the wandring Nerves, is laid up in the *Meſentery*, or in other Infoldings within the *Abdomen*; the reaſon is, that in theſe

1. The nervous Liquor is in fault, becauſe the Morbifick Matter is gathered together in it.

2. The nerves of the wandring pair, and their meſentevick Infoldings, becauſe they receive into themſelves this matter.

theſe nervous Infoldings, many and large Nerves of the ſame conjugation are at laſt terminated: wherefore, if the Recrements of the nervous humor, ſubſiding here as it were upon its bottom, neither can be drawn back by any of the Veſſels, nor paſs into the cavities of the Inteſtines, there is a neceſſity that it muſt erect in this part its morbid neſts.

The evident cauſes are of a double kind, to wit, firſt, thoſe that do injury to the Brain and nervous ſtock, by cauſing a greater proviſion of the Morbific matter: or, ſecondly, thoſe which by agitating or ſhaking the Blood and humors, ſtir up the Mines gathered together, and before quiet, and provoke them into painful heats or fermentings. It would be tedious here to examine the manifold, and diverſe occaſions, by which the *Colick* pains are brought upon thoſe prediſpoſed; for theſe often are cauſed by great inordinations in the ſix *non naturals*, and the mutations of the Air, and the Year; and moreover (by what help ſhould be expected) by the untimely adminiſtring Medicines themſelves. *The evident cauſes of this Diſeaſe.*

From what has been ſaid, the differences of this Diſeaſe may be eaſily known. For, firſt, by means of the cauſes, we have ſhewn the *Colick* to be either accidental, which is cauſed by reaſon of the *Inteſtines* being provoked by ſharp contents, ſuch as we but now deſcribed it. Secondly, By reaſon of the place affected, the *Colick* is ſometimes ſuperior, ſometimes inferior, ſometimes *lateral* or of the ſide, as the Morbific matter is fixed, either ſometimes in this part, ſometimes in that part of the *Meſentery*, or in other infoldings of the *Abdomen*. Thirdly, By reaſon of the ſickly condition and temperament of the ſick, it is called a *Bilous*, or *Cholerick*, a *Phlegmatick*, or a *Melancholick Colick*; alſo either ſimple, or *Scorbutick*; not that theſe imaginary humors excite of themſelves the *Colick*, but according to the diſpoſitions of the Body diſtemper'd, various *Symptoms* are made, or cauſed to vary. *The differences of this Diſeaſe.*

As to its *Prognoſtick*, it is commonly known, that the accidental *Colick*, to wit, excited from a ſolitary evident cauſe, is moſt often ſafe, and with an eaſie matter cured; but the habitual, as to its diſpoſition, it is very difficult to be rooted out; ſo that the fits may no more return; and its fits ſometimes are pertinacious, notwithſtanding Remedies, and ſometimes continue many days, yea weeks, and months. *Its Prognoſtick.*

2. The *Colick* diſpoſition frequently ſucceeds long intermitting Feavours, and continual, being evilly handled; for that the nervous Liquor being highly vitiated, gathers together many Recrements, which are deeply depoſed into the Infoldings of the *Abdomen*, as it were the more open receptacles. Further, for this reaſon, an *Epidemical* Feavour rages ſome years, to which the *Colick* is joined, as its *Pathognomonick* or peculiar *Symptom*: hence in like manner, a long and grievous *Scurvy* cauſes alſo the *Colick*, becauſe it perverts the nervous liquor.

3. After the *Colick* pains have raged for ſome time in the Belly, they fall oftentimes into the Loins, and then the Diſeaſe increaſing or growng worſe, they enter upon the members, and the muſcles almoſt all in the whole Body, and at length oftentimes end in the *Palſie*; which certainly is a manifeſt ſign, that the Morbific matter is not carried by the Arteries, but by the Nerves; and that its ſubject or ſeat, is not the cavities or the coats of the *Inteſtines*, but the nervous Infoldings of the *Meſentery*: For becauſe the *Lumbary* pains, or thoſe of the ſide, do come upon the torments of the Belly, beſides that the Nerves of either place communicate, the cauſe is further, for that the Morbific matter being much increaſed in the Head, ſlides down, not only into the wandring pair, but alſo into the *ſpinal* Marrow; and entring into it, and ſetling in its bottom, cauſes pains to ariſe in the Loins, and afterwards in many other Nerves, which proceed from the *Spine* or Back-bone, and in other Members and Muſcles diſtemper'd; laſtly, it brings in the *Palſie* by the paſſages of the Nerves being ſtuffed by the Morbific Matter heaped up to a plentitude in them.

4. The more cruel *Colick*, and very much raging, whoſe cauſe is an Inflammation, or an Impoſthum of ſome *Inteſtine*, for the moſt part induces the mortal *Iliack* Paſſion.

The *Curatory* method in the *Colick*, as in moſt intermitting Diſeaſes, ſuggeſts three primary *Indications*: The firſt of which *Curatory*, to be adminiſter'd in the fit, reſpects the allaying of the pains, and for the ſooner and more eaſie taking away the coming of the Diſeaſe. Secondly, *Preſervatory*, which ſhews the taking away the cauſe of the Diſeaſe without the fit, that the fits may not be often repeated, or more grievouſly inſeſt. Thirdly, *Vital*, which ſupplies Remedies for the preſerving of ſtrength in the torments, and moſt cruel Cruciations, and for the cheriſhing of the Spirits. Concerning theſe we ſhall ſpeak a little more fully in order. *The Cure.*

1. We almoſt only reſpect the *Curatory Indication* in the accidental *Colick*; for the evident cauſe, which is an irritation of the *Inteſtines* by ſharp contents, being removed, the pains for the moſt part ceaſe of their own accord, nor do they return without the like *1. The firſt Indication Curatory.*

like occaſion. Wherefore, for the quick curing of this Diſeaſe, the practice is well enough known to every common perſon, among the vulgar, to wit, preſently to adminiſter ſoftning *Clyſters*, *Topick Anodynes*, and *Narcoticks*; to which, if a Feavour be joined or feared, letting of blood is often uſed with ſucceſs. We ſhall ſet down forms of theſe, and the order of uſing them in the Cure of the habitual *Colick*.

What the chief Medical intentions are in the Fit.

Therefore, for the healing of this Diſtemper, in the fit, there are two chief *Intentions*; to wit, both to take away the painful breach or ſolution of the unity, and to allay the burning or growing hot of the Fibres, and the Spirits in them. For the former, you muſt endeavour, both that the matter impacted in one or more Mines, may be ſhaken off or ſubdued; and alſo, that a flowing in of new matter may be hindred. The ſecond *Intention*, which ought chiefly and continually to be inſiſted upon, is performed by *Anodynes* chiefly, and *Narcoticks*: After what manner, and by what Remedies, every one of theſe are methodically to be done, we ſhall now ſhew you.

For the moſt part Clyſters are to be begun with,

Moſt often, the Cure of the pain of the *Colick*, and that rightly, is begun with a *Clyſter*. Let this at firſt be gentle, and only emollient, by which the Corrugations or the wrinklings of the Fibres may be allayed, and the burning Spirits flattered or pleaſed. For this end, warm Milk with Sugar, or *Moloſſus*, or Syrup of Violets, is convenient; as alſo Emollient Decoctions of Mallows, Marſh-mallows, Mercury, with the Flowers of Melilot, and Elder, with the Oyl of Almonds, or of Olives; alſo a Decoction of a Sheeps-head, or Calves-feet: ſometimes a *Clyſter* of mere Oyl of Olives, or of Linſeed Oyl, is wont to help before any others.

Which are at firſt to be gentle;

afterwards more ſharp Clyſters.

But if the more gentle *Clyſters* do not looſen the Belly, nor are eaſily ejected, there muſt be given ſuch as will more provoke, and preſs, or as it were ſtroke forth the humors, by the little mouths of the Arteries: For which end, let there be prepared *Carminative* Decoctions, or ſuch as expel wind, or bitter Decoctions; in which are diſſolved *Electuary Diacatholicon*, *Diaphœnicon*, or of *Laurel berries*, or *Species Hiera*: Alſo to theſe Liquors it is uſual to add the Infuſion of *Crocus Metallorum* three or four ounces, or of the *Emollient* Decoction one pint: add of *Venice Treacle* diſſolved with the yolk of an Egg one ounce or an ounce and a half; or Take *of ſound Urine one pint, of Venice Turpentine diſſolved one ounce and a half, of Moloſſus one ounce*, mix them, and make a Clyſter. I have known this oftentimes to bring great help; the reaſon of which ſeems to be, for that the Balſamick Particles of the *Turpentine* comfort the *Inteſtines*; and beſides, being received by the Blood in the Veins, and with it circulated thorow the whole Body, moves the Urine, ſo that by ſuch a *Clyſter*, plenty of water follows, and always is rendred with a ſmell like Violets. Perhaps alſo, the Particles of the *Turpentine* being every where diffuſed, either move the ſtagnating Morbific matter, or incline the acetous, or otherways degenerate, to a better diſpoſition.

Fomentations.

Whilſt the *Inteſtines* are thus waſhed with *Clyſters*, and are cheriſhed within, Fomentations are likewiſe to be applied to the outer parts of the Belly. Take *of the leaves of both the Mallows, of Mercury, of Pellitory, each four handfuls; of the Flowers of Elder, Chamomil, and Melilot, each two handfuls: the head of a Sheep cut in pieces.* Let them be boiled in as much Spring-water as will ſuffice; ſtrain it, and uſe it for a Fomentation, with hot linnen ſtuphes dipt in it, and wrung forth, and ſhifting them apply them by turns. Repeating them as often as the more ſtrong pains do come upon them: In the intervals, *Pulteſſes* or *Oyntments* may be adminiſter'd.

Pulteſſes.

Make a Pulteſs of bruiſed Herbs, adding to it of oaten meal what will ſuffice; which may be laid to the belly, covering it with little ſquare bags made for that purpoſe. Let one of theſe at a time be made hot in a pan ſet over hot coals, with the Oyl of Earth-worms, or of Frogs; lay them on warm, ſhifting them as ſoon as one grows cold.

An Oyntment.

Or Take *of the Oyl of Earth-worms or of Frogs what will ſuffice; and anoint the pained part, after the Fomentation, and lay upon it a thin ſheet of fine brown paper dipt in it.*

The Caul of a Lamb, or the Lungs, or the Inwards of any other Beaſt, being laid warm to the Belly, and ſo ſhifted, ſometimes wonderfully eaſes the pain.

Cold Fomentations.

I have obſerved in ſome Conſtitutions and temperaments, that *Fomentations* or Bathings made of hot things, and applied hot, have rather made the pains worſe than eaſed them: wherefore in theſe caſes, it will ſeem good to preſcribe Fomentations of the ſolutions of *Nitre*, or of *Sal Armoniack*, or other *Chymical* Liquors, as in the pains of the *Gout*, and ſometimes (as *Septalius* ſays) of pure cold water.

But if the torments of the Belly do not remit by the uſe of theſe, *Hypnoticks* muſt be uſed; which being given in a juſt Doſe, oftentimes give great truces: In the mean time, that the tired Spirits may be refreſhed, and ſtrength preſerved, there muſt be yet inſtituted a farther proviſion againſt the Diſeaſe.

Take

Take *of liquid Laudanum Tartariſated, from ſixteen drops to twenty, let it be given going to ſleep, in a ſpoonful of the water of Chamomil flowers, drinking after it ſix ſpoonfuls of the ſame water: Let it be repeated every other, or every third night, if the pains be very great.* *Opiates.*

In a more hot Conſtitution, Take *of the water of Chamomil flowers three ounces, of the Syrup of Poppies half an ounce, of Aqua mirabilis two drams; make a draught, to be taken at the hour of Sleep.*

In the mean time, whilſt theſe things are doing, for the allaying the pains, evacuating Remedies have their turns, for the diſcuſſing, or at leaſt for the looſning the matter impacted in the morbid neſts; to wit, that both the *Colick* Mine may be wholly extirpated; and alſo that the ſupplements or its cheriſhment be cut off, that they may not more increaſe. For theſe ends a *Vomit* (where it is convenient) and a gentle purging, ought to be ordered; and alſo in an hot temperament, where there is a Feavour, or where it is feared, letting of Blood. *Evacuating Medicines.* *Vomiting Medicines.*

Take *of the Sulphur of Antimony, from five grains to ſeven or eight, of the Conſerves of Borrage one Dram; let it be given in the Morning with government.* In this caſe may be given, according to the judgment of the *Phyſician* preſent, either an Infuſion of *Crocus Metallorum*, or of *Mercurius Vitæ*: The *Emetick Tartar* of *Mynſicht*, the expreſſion of the leaves of *Aſarum*: and in more tender Conſtitutions, Salt of *Vitriol*, and Wine and *Oxymel* of *Squills*.

Purges muſt be given only in a ſmall Doſe, and ſuch as are choice, leſt they move a nauſeouſneſs in the ſtomach of the ſick. *Purges.*

Take *of the Reſine of Jalap, of Scammony, each five grains, of the Cream of Tartar one ſcruple, of Cinnamon powdered four grains; make a Powder, or let it be reduced into Pills, or into a Bolus, with the Conſerves of the Flowers of Borrage, or Damask Roſes.*

Take *of Scammony ſulphurated half a ſcruple, of the Cream of Tartar fifteen grains, of Diaphoretick Antimony one ſcruple; make a Powder, and let it be given after the ſame manner.*

If there be not a Feavour, a Doſe of Stomach *Pills cum Gummi* may be given, or of *Amber* by it ſelf, or with the *Reſine* of *Jalap*.

Take *of Pill. Rudii twenty five Grains, or half a dram, of Laudanum one grain; make four Pills, let them be taken at the hour of reſt:* Theſe at firſt cauſe ſleep, and Purge in the morning. Or, Take *of Calomelanos one ſcruple, of the Reſine of Jalap ſix grains, of Scammony four grains, of Ammoniacum what will ſuffice; make four Pills to be taken going to reſt.* *Salivation.*

In a long and tedious *Colick*, when all other Remedies help little or nothing, I have often known this Medicine, being once or twice given, to have moved *Salivation*, with the greateſt eaſe to the ſick. For when the morbific matter, being heaped together, and thorowly impacted in the nervous Infoldings, and other places about the *Abdomen*, could not be moved by any other Medicines; the *Mercurial* Particles every way unfolding themſelves, eaſily diſſolve it, and divide it into ſmall bits, and drive it up and down hither and thither, and at length wholly diſſipate it. Wherefore in a long and pertinacious *Colick*, a gentle *Salivation* ſometimes may be very happily adminiſter'd.

Baths, and *Sweating* Medicines, are ordinarily wont to be preſcribed in the pains of the *Colick*; but as to our obſervation, very rarely with ſucceſs: For that theſe, by ſhaking the Blood and nervous humor, cauſe them to lay up ſtill more matter into the *Colick* Mine, yea and that matter there depoſited, to grow more hot and raging, and very rarely wholly ſhake it off. *Baths.*

Diureticks are wont much more profitably to be given, by which when the Blood is poured forth, and its ſeroſities plentifully precipitated, the nouriſhment of the Diſeaſe is cut off, and the bloody Maſs being emptied, receives part of the Morbific matter, ſo that its reliques are more eaſily ſhaken off. For this end, *Diureticks.*

Take *of the beſt Spirit of Tartar rectified half an ounce; let half a dram be given twice or thrice in a day, in a ſpoonful or two of the following Julap, drinking after it five ſpoonfuls of the ſame.*

Take *of the Water of the leaves of Burdock, or of Aron, or of Arſmart, one pint; of the Water of the flowers of Elder and of Chamomil, each four ounces; of the compound water of Gentian, of the compound Water of Raddiſhes, each two ounces, of Sugar ſix drams; mix them together.*

After

After the ſame manner as the *Spirit* of *Tartar*, may be given in a juſt Doſe, ſometimes the *Tincture* of the *Salt* of *Tartar*, ſometimes the ſimple mixture, or the Spirit of *Sal Armoniack* ſuccinated, or impregnated with *Amber*.

Take *of Millepedes prepared two drams, of the flowers of Sal Armoniack Tartarized one dram, of the Oyl of Nutmegs half a ſcruple, of Turpentine what will ſuffice; make a Maſs, and let it be made into Pills; take three or four once or twice in a day, drinking after it a Doſe of the Julep, or of the following diſtilled water five or ſix ſpoonfuls.*

Take *of freſh Millepedes or Hog-Lice cleanſed one pint and a half, the outer rind of ſix Oranges, and of four Lemons, ſix Nutmegs; let them be cut ſmall, and add to them one pound of the crumbs of ſtale white Bread: all being bruiſed together and well mixed, pour to them four pints of new Milk, and of Sack one quart; let them be diſtilled according to art, and the whole liquor mixed together; you may ſweeten it with Sugar, or the Syrup of Violets as you pleaſe.*

Mineral Purging Waters. In a long and pertinacious *Colick*, to thoſe who are of a more cold temperament and *Viſcera*, Purging *Spaw* Waters, or Whey with the Syrup of Violets, are wont to be given oftentimes with great help; for both liquors, where they are agreeable, being plentifully drunk, refrigerate the ſtomach and the hot Inteſtines, and preſently looſen and help them in their painful Cramps and wrinklings, or from the Convulſive winds or blaſts that extend them; beſides, they chiefly help (as I ſuppoſe) for that they tame and ſubdue the *Saline* Particles of another nature, inſinuating themſelves into the Morbific Mine, and other *Saline* and irritative Particles inhabiting it, and oftentimes carry them forth by Purging.

In this Diſeaſe, as all things are not convenient for all men, yea neither the ſame thing always for the ſame perſon; there is dayly need of the careful obſervation of a prudent *Phyſician*, that by the co-indications from things taken, that hurt or help, a right method of healing may be inſtituted, and varied as occaſion ſerves.

2. The Vital Indication ſuggeſts Remedies. 2. The *Vital Indication* ought to be joyned to the *Curatory*, and that between whiles. For when the ſick, being afflicted with torture, watching, Vomiting, and abſtinence almoſt continual, often fall into languiſhment, and ſometimes in danger of their lives; Remedies which ſuſtain ſtrength, refreſh the Spirits, and procure ſome truces againſt the fierceneſs of the Diſeaſe, to wit, *Cardiacks* or *Cordials*, and *Hypnoticks* or ſuch as cauſe reſt, have here their turns.

Cardiack. Take *of the Water of the flowers of Chamomil, and of Elder, each four ounces; of Barlyed Cinnamon, and of the whole Citron, each two ounces; of Pearl powdered one dram, of Sugar three drams; make a Julep, take of it five or ſix ſpoonfuls.*

Take *of the Powder of Pearl, and of Crabs Eyes, each one dram; let it be divided into four parts; let one part be given twice or thrice in a day, with the Julep, or with a Decoction of the roots of Contrayerva.*

Take *of the Conſerve of Clove-Gilliflowers one ounce, of the Confection de Hyacintho, of Alchermes, each two drams; of Pearl powdered half a dram, of the Syrup of the juice of Citrons what will ſuffice; make a Confection, give of it the quantity of a Nutmeg, three or four times in a day with the Julep.*

In leſs hot Conſtitutions, *Spirits* of *Harts-horn*, of *Sut*, of *Sal Armoniack* impregnated with *Amber*, alſo the *Tincture* of *Antimony*, or of *Coral*, do oftentimes give notable help.

Hypnoticks. *Opiates* are of neceſſary uſe in the Diſeaſe of the *Colick*, without which, the ſick cannot live, nor the *Phyſicians*, nor thoſe who attend them be at quiet, or have any leaſure time. Take *of the water of Cowſlip flowers three ounces, of the Syrup of Poppies half an ounce, of Aqua Mirabilis two drams; mix them and make a draught to be given going to ſleep.*

If the pains be very ſtrong, and yield to no ſuch Remedy, prepared *Opium* and its compoſitions ought to be given. The *Laudanum* of *Paracelſus*, or the *London Laudanum*, Pills of *Styrax*, or of *Hounds-tongue* are convenient; a Solution of *Tartariſated Opium* from ſixteen to twenty grains is much uſed by me. Which Medicine indeed I have given with very good ſucceſs, to ſome, that for a long time have been miſerably vexed with this Diſeaſe, ſometimes a great while every night or every other night.

3 The Preſervatory Indication, by which are indicated, 3. The *Preſervatory Indication* hath only place in the intervals of the fits, and endeavours the taking away the preſent foregoing cauſe of the Diſeaſe, and hindring it for the future, ſo that the fits of the pains may ſeldom or never afterwards return: For which end, the Blood and the nervous liquor ought to be purified, leſt they ſhould beget the morbific matter, and conſerved in its due temper, and the Brain and the nervous Infoldings

foldings of the *Abdomen* corroborated, leſt they ſhould too readily receive it. For theſe ends, a ſtrict dyet being ordered, let them enter into a courſe of *Phyſick* Spring and Fall; ſuch as we preſcribed for the prevention of the *Gout*.

Vomiting in this caſe is never to be omitted, if it be agreeable, to wit, by which the Emunctories of the *Viſcera* being emptied, the Recrements of the Blood, and the nervous Liquor, which otherwiſe would augment the morbific matter, may be received more plentifully; beſides the nervous Infoldings, and all the parts are ſo ſhaken, that nothing of that which is about to go into the Mine of the Diſeaſe, is ſuffered to ſtagnate or to be heaped up there. *Vomiting.*

Let Purging for three or four times, with due intervals, and alſo in a hot Conſtitution, *Phlebotomy* be celebrated; moreover, let altering Remedies, and eſpecially *Chalybeats*, or ſuch as are made out of Steel, when they do not Purge, be daily taken at medical hours. *Purging.*

But before all other Remedies whatſoever, the drinking of Mineral Waters, ſuch as come from Iron, for a month, in the Summer time, is wont to give the greateſt help: But when theſe are drunk, you muſt take heed, that they be rendred well and quickly by Urine or Stool, leſt if they ſhould chance to ſtay long in the body, by running into the Head or Feet, (as they often do) they ſhould cauſe a *Vertigo* or the *Gout*. *Altering Remedies.*

Take *of our Tincture of Steel one ounce, and let fifteen to twenty drops be taken twice in a day in ſeven ſpoonfuls of the following Julep.*

Take *of the Waters of the leaves of Aron, and of Burdock, each half a pound; of the Magiſterial of Earth Worms, of Gentian compound, of Pœony compound, each two ounces; of Sugar half an ounce; mix them.*

After the ſame manner, here deſervedly have place the Tincture of *Antimony*, and of *Amber*, yea and many other altering Remedies above preſcribed for the Diſtempers of the Head, may alſo be uſed for the preſervation from the *Colick*, whoſe foregoing cauſe proceeds from the Brain.

As to *Charles Piſo*'s Obſervation, by which he endeavours to prove, that the cauſe of the pain of the *Colick* remains wholly in the Brain, becauſe he had found a *Serous* deluge in the Head of a certain perſon dead of that Diſeaſe: I ſay, that this *Serum* being heaped up in the head, was the remote and antecedent cauſe of this Diſeaſe, and not the conjunct cauſe. But indeed it is probable, that from this firſt ſpring a certain portion of this ſuperfluous and ſharp Serum did deſcend, by the nervous paſſage, into the nervous Infoldings of the *Abdomen*, and there conſtitute the Mines of the *Colick* Diſtemper. Further, although the Morbific matter there ſliden down, becauſe of the tenuity of the parts, and the ſmallneſs of the neſts, can rarely be ſeen with the eyes, yet I have plainly ſeen and handled ſuch a Mine of this Diſeaſe become inveterate and very cruel, not long ſince, in the *Meſentery*, opening the dead body of a certain Gentlewoman, of whom I have elſewhere made mention. *The Objection of Charles Piſo ſolved.*

Being ſometimes ſince conſulted with, concerning the curing of a Reverend old Man, grievouſly obnoxious for many years to the Diſeaſe of the Colick; I adminiſter'd to him the ſame method of healing, and the Remedies I but now deſcribed; by the uſe of which, he found himſelf much better after a month or two, and within half a year he ſeem'd to be perfectly well, ſo that he lived afterwards wholly freed from any fits of the pains: But the *Colick* diſpoſition had not long ceaſed, and he had omitted the uſual courſe of Medicine, but he ſuffer'd about his throat a reſolution or looſning in the Muſcles ſerving for ſwallowing, which troubled him oftentimes, ſo that he was in danger to be choaked by Food, and chiefly by liquid things ſticking in that place. Againſt this evil receiving help by *Antiparalytick* Remedies, he continued from thence ſix or ſeven years in moderate health; at laſt, being taken, the firſt time in the midſt of a journey with an *Apoplexy*, he dyed. It is obvious enough in this caſe, that the Recruments of the nervous liquor, that were wont to be depoſed about the nervous Infoldings of the *Abdomen*, did at firſt ſtir up the Diſtemper of the *Colick*; then the ſame being ſhut forth from that part, getting another neſt for themſelves about the *Ganglioform* nervous Infoldings of the Throat, brought in the reſolution or ſhort Palſie of the *Oeſophagus*; and laſtly, by reaſon of the ſame matter reſtagnating in too great a plenty in the middle part of the Brain, that deadly ſenſleſneſs followed. *The firſt Hiſtory.* *The Reaſon of it.*

A certain cunning and crafty little Lawyer, about fifty years of Age, was wont to be troubled for many years with a periodical Headach, and with a ſtupor or numneſs of his Senſes, and a great weight of his head; about the middle of Summer labouring very much with the aforeſaid Diſtempers, he perceived a ſudden eaſe from the applying of Topical Remedies; but a little after, he was taken with a very cruel *Colick*, then *The ſecond Hiſtory.*

being the first time; whose fit fell upon him with so much cruelty, that his strength suddenly failing, he fell into frequent swooning fits, with a cold sweat, which fit notwithstanding by leasure vanished within twenty four hours, without any breaking of wind, or going to Stool. But after that, he suffer'd frequent fits, and became obnoxious to the Disease; all which (as I was carefully informed) for the most part were usher'd in with a pain of the Head, with a *Vertigo*, and amazedness, or stupidity, and from hence he was wont to presage the pains of the *Colick* would very suddenly follow. In a certain fit, which lasted for twelve days with great cruelty, the sick person himself observed, and told me, that whilst the distemper troubled him in his Belly, he felt no trouble in his head, but the *Colick* pains remitting, presently the *Vertigo* returned, with the Headach: from which reciprocal translation of these *Symptoms*, from the Head into the Belly, and so on the contrary from the Belly to the Head, we may lawfully argue, that the same Morbific matter, flowing in the nervous Passages, falling down sometimes below, brought in the *Colick* Passion, and sometimes above; and restagnating, caused those distempers of the Head. Hither may be referred, what *Charles Piso* hath accurately observed concerning himself, being wont to be affected with *Cephalick* distempers, and the *Colick* pains by turns, and with a mutual dependency, *Sect.* 4. *C.* 2. *p.* 355.

The Reason of it.

The third History.

Not long since, a certain studious young Gentleman, and living a sedentary life, began to complain of a great stupidity of his senses, and a dulness, as also of a great weight of his Head, and almost continual sleepiness; further, his Ventricle or Stomach was become so slothful and stupid, that he wanted all manner of Appetite, whilst a Cure was instituted against this evil disposition, by Remedies which roused up the Spirits, and shook off their burthens, this Gentleman fell into a most cruel *Colick* Passion (which he was never obnoxious to before) from which a most cruel pain, like the boreing of an Auger, possessed the middle of the *Abdomen*, his Navil being drawn inwards, and notwithstanding the daily use of all kind of Remedies, it continued for three weeks, with great cruelty; that in the time he could take no rest, but what he received from *Narcoticks*, nor could he receive any ease from his pains, unless by an hot fomentation. Certainly in this case it is plain enough to every one, that the impurities of the nervous liquor being gathered to a certain fullness, was the immediate or conjunct cause of the whole sickness; which matter subsisting first in the Head, brought in the notable stupidity of the Brain and the oppression of the Animal Function; then being fallen down, by the passage of the Nerves, into the nervous Infoldings of the *Abdomen*, caused that cruel and daily *Colick*.

The Reason of it shew'd.

FINIS.

A TABLE.

A.

AFfections, *how wont to be iterated, and how allayed or obliterated*, 49. *they are more than eleven*, 54. *the two primary affections or geſtures of the Soul, are pleaſure and grief* 48

Altering *Medicines are of the greateſt moment, in the cure of melancholy Diſeaſes, and not purging Medicines as the Antients thought* 196

Anatomy *of an Oyſter*, 9. *of a Lobſter* 11

Anger, *its character*, 54. *'tis of kin to boldneſs* ibid.

Animals *reduced into claſſes*, 7. *as Fire and Light are chiefly energetical in mechanical things, ſo in Animals. In perfect ones there ought to be many ſenſes* 56

Animal *ſpirits, what they are*, 23. *to what compared*, ibid. *they abound in an objective, and an active virtue*, 24. *they are the efficient cauſe of ſenſe and motion*, 56. *a moſt ſwift communication of them implanted within all the parts*, ibid. *an oppoſite tendency of them effect both ſenſe and motion*, ibid. *they paſs through the ſenſible ſpecies; and not the effluvia of the object, penetrate even to the head*, 59. *they actuate the Rainbow of the Eye very much*, 85. *they are the immediate ſubject of ſleep*, 87. *and the immediate ſubject of the Vertigo*, 147. *their diſtemper being after a diverſe manner, as it is the cauſe of the phrenſy, ſo it is of Melancholy, Madneſs and Stupidity*, 188. *from what diſpoſition of them the primary* Phænomena *of a melancholick Delirium proceed*, ibid. *as they are compared to light, they are call'd opacous or full of darkneſs*, 189. *theſe kind of ſpirits in melancholy compar'd to thoſe in Chymical Liquors*, ibid. *they are not like the ſpirit of Blood as they ſhould be, nor like the ſpirit of Wine, for ſuch is rather in the Phrenſy*, ibid. *they are like acid ſpirits diſtill'd out of Salt, Vinegar, Box, and ſuch like*, ibid. *Stygian Waters are like the nature of the Animal Spirits in madneſs*, ibid. *three chief affections of acetous Chymical Liquors, which agree with them in Melancholy; firſt the effluvias falling away from theſe Liquors are perpetually in motion; in like manner alſo the Spirits in the Phantaſy of a Melancholick Perſon; thence the effluvias from acetous Chymical Liquors do not proceed far; in like manner the imagination of a Melancholick Perſon, though always imployed, comprehends only a few things, and therefore every thing is conceived with a greater Image than it ſhould be: Laſtly, effluvias from acetous Liquors do not evaporate ſo much from open Pores as they make new; and in like manner, whilſt the Animal Spirits form new tracts in the Brain, produce unwonted and incongruous notions*, 190, 191. *after they have for ſome time been vitiated in melancholy, the conformation of the Brain is alſo hurt*, 191. *how they acquire a diſpoſition like to Stygian Water*, 202. *they are the ſubject of Madneſs* 201

FINIS.

Advertiſement.

DOctor *Willis*'s Practice of Phyſick, being all the Medical Works of that Renowned and Famous Phyſician, Containing theſe Ten Treatiſes following, *viz.* I. Of Fermentation. II. Of Feavers. III. Of Urines. IV. Of the Accenſion of the Blood. V. Of Muſculary Motion. VI. Of the Anatomy of the Brain. VII. Of the Deſcription and Uſe of the Nerves. VIII. Of Convulſive Diſeaſes. IX. Pharmaceutice Rationalis, the firſt and ſecond Part. X. Of the Scurvey. Wherein moſt of the Diſeaſes belonging to the Body of Man are treated of, with excellent Methods and Receipts for the Cure of the ſame. Fitted to the meaneſt Capacity, by an Index for the explaining of all the hard and unuſual Words and Terms of Art, derived from the Greek, Latin, or other Languages, for the benefit of the Engliſh Reader. With a large Alphabetical Table to the whole. With Thirty Copper Plates. Done into Engliſh by *S. Pordage* Student in Phyſick. Printed for *T. Dring*, and *C. Harper* in *Fleetſtreet*, and *J. Leigh* at *Stationers Hall*. Price Thirty Shillings.

There is now Publiſhed the ſecond Volume of Dr. *Nalſon*'s Impartial Collections of the Great Affairs of State, from the beginning of the Scotch Rebellion, in the Year 1639. to the Murther of King *Charles* the Firſt; wherein the firſt occaſions, and the whole ſeries of the late Troubles in *England*, *Scotland*, and *Ireland*, are faithfully repreſented, taken from Authentick Records, and methodically digeſted, with a Table. Publiſhed by his Majeſties ſpecial Command. Sold by *Thomas Dring* at the *Harrow*, at the Corner of *Chancery-Lane* in *Fleetſtreet*.

Since nothing could ſo well expreſs the meaning and intention of the Author, as the very *Latin* and *Greek* Words uſed in theſe Tracts, we have continued them expreſly, and though in many Places I have given their meaning by *Synonyma's*, yet for the benefit of meer *Engliſh* Readers, we have here compoſed a Table Alphabetically of all the hard *Greek* and *Latin* Words, uſed in the whole Volume; as alſo of all Terms of Art, and many other Words derived from the *Latin* and *Greek*, tho' uſual among Scholars, yet not frequently known to the vulgar, and therefore we have fully explained them, andrendred them intelligible to the meaneſt Capacity in the following Table.

A TABLE of all the hard words derived from the *Greek* and *Latin*, of all Terms of Art and other words not vulgarly received, with the Explanation of them.

A

ABdomen, *The lower part of the Belly from the Navel downwards.*
Ablution, *A waſhing away.*
Accenſion, *An Inkindling.*
Acceſſion, *A coming to or approach.*
Acme, *The height or top of a thing.*
Acid, *Sharp.*
Acidity, *Sharpneſs.*
Acidulæ, *Medicinal waters running forth from Veins of Iron, Copper, and ſuch like, called* Spaws *from that famous place for Mineral-waters, the* Spaw *in* Germany.
Acrimony, *Sharpneſs or ſourneſs rather.*
Actionoboliſm, *An Irradiation of Beams, or ſhooting forth of the ſpirits like beams of the Sun.*
Acomite, *A venomous poiſonus Herb put for* Libbards *bane*
Acute, *Sharp, or exceſſive painful, or that is quick and dangerous.*
Aculeated, *Made ſharp and prickly like a Needles point.*
Adhæſion, *A ſticking to.*
Adjuted, *Helped.*
Adventitious, *Coming by accident, or by the by.*
Aduſt, *Burnt or parch'd.*
Aduſtion, *A burning or parching.*
Æquilibrium; *An equal or even poiſe when the Balance ſtands bending neither to the one ſide or the other.*
Æquinox, *When the Sun is in the Equinoctial Line and divides the Day and Night into an equal length, and is about the* 12. *of* March *and about the* 12. *of* September.
Ætherial, *Heavenly or belonging to the Air or Skie.*
Ætiology, *The rendring of the Cauſe or Reaſon of a thing.*
Affection, *Taken for the natural Condition, and often ſignifies ſickneſs or diſeaſe.*
Affected, *Diſtempered or diſeaſed. Sometimes natural diſturbance.*
Affuſion, *A pouring forth of any thing.*
Agaric, *A Drug that purges Phlegm.*
Aggeſtion, *A heaping together of any thing.*
Agitated, *A violent ſhaking or jogging together.*
Alembic, *An* Arabic *word for a Still uſed by Chymiſts.*
Alexipharmaca, *Medicines againſt Poiſons and venom.*
Alexiterion, *The ſame, being an Antidote againſt Poiſon.*
Alchaliſat, *A ſalt made of the herb* Kali. *Alſo taken and applyed to ſalts made of Herbs and ſhells of Fiſhes.*
Alible. *Nouriſhable, or that nouriſhes.*
Aliment, *Food.*
Alliſion, *A ſtriking or knocking together.*
Aloes, *A juice made out of a bitter herb uſed in purging Medicines, alſo a ſweet wood.*
Amalgama, *A Chymical Term for the ſetling and mixture of ſeveral Minerals or Metals, or other things whereby a ſeparation and extraction may be made.*
Ambages, *A compaſſing or going about.*
Ambient, *That invirons or compaſſes one about as the Air.*
Amulets, Pomanders *or* Bracelets *made againſt Witchcraft, and Infection and Poiſon.*
Analogy, *Proportion, or agreement or likeneſs.*
Analaſis, *The laying open or unfolding of the matter.*
Anatomy, *A diſſecting the Body, to ſee the ſeveral parts.*
Anaſarca, *The watry Dropſie ſwelling up the whole fleſh.*
Analeſia, *A ſtupifying diſeaſe that takes away the ſenſe from all parts of the Head.*
Angle, *A Mathematical Term, being the nook or ſpace at the cutting of two lines, and is of ſeveral ſorts. A Corner or nook.*

Anhelous, *Short-winded, or that puffeth for want of breath; that breatheth difficultly.*

Annulary, Annular, } *Ringy, or like Rings.*

Anodynes, *Medicines procuring eaſe from pains by ſleep or other means.*

Anomal, *Irregular, out of order.*

Antaſthmaticks, *Things good againſt the Cough or* Aſthma.

Anterior, *The former.*

Antidote, *A Medecine againſt Poyſon or any other diſeaſe.*

Anticipate, *To go before.*

Antihypnotics, *Medecines given againſt too much ſleeping.*

Antipyreuticon, *A Medecine againſt a Feaver, or a Feaver-Curer.*

Antipyreticks, *Medecines againſt burning Feavers.*

Antiſpaſmodicks, *Medecines againſt Convulſions.*

Anus, *The Fundament or Arſe-hole.*

Aorta, *The great Artery the mother of all the reſt, proceeding from the Heart, one branch aſcending, another deſcending.*

Apoplectic, *One ſubject to the Apoplexy.*

Apoplexy, *A diſeaſe that ſtupifies and takes away ſenſe and motion.*

Apozems, *Decoctions or drinking medecines made with herbs.*

Appendixes, *Things belonging or depending on another, as the parts about the heart.*

Aquoſity, *Wateriſhneſs.*

Area, *The void ſpace in a Figure, as a Triangle or Quadrangle: The Plat or Floor of any thing.*

Armoniac, *Salt extracted out of ſtones.*

Arteries, *The Veſſels that carry the blood to the heart.*

Arthritick, *Gouty or belonging to the Gout.*

Arſnick, *Or Orpiment, a poiſonous drug.*

Archeus, *A cheif officer, Workman, or Operator.*

Articulation, *A ſhooting of ſpriggs from the joynts.*

Aſcites, *A kind of Dropſie which ſwells between the skin and the fleſh.*

Aſper, *Sharp, Aſper artery, the wind-pipe.*

Aſſimulation, *A growing or making like.*

Aſſimulate, *To grow or make like.*

Aſthma, *A troubleſome diſeaſe, when the lungs being ſtopped, one cannot take breath.*

Aſthmatical, *Belonging to that diſeaſe, or troubled with it.*

Aſtringent, *Binding.*

Ataxias, *Diſorders, irregularities.*

Atoms, *Small little Bodies, ſuch as motes in the Sun-ſhine.*

Atrabilous, Atrabilary, } *Belonging to the black Bile or melancholy or to the melancholy humour.*

Atrophy, *A diſeaſe cauſing a pining away, or a waſting, or Conſumption of the fleſh.*

Attrition, *A knocking, or bruiſing, or rubbing together.*

Auditory, *An Aſſembly, or thoſe who hear.*

Aurum fulminans, *Or thundering Gold, a metal prepared by Chymical Art, that being heated goes off like a Gun with a Thundering noiſe.*

Auſtere, *Biting, harſh.*

Axillarie, Vein *is a branch of the* Vena Cava *coming thorough the arm-hole from the chanel bone deſcends into the inſide of the arm.* Artery *ſprings from the left ſide of the* Aorta *above the heart, and aſcending obliquely thorow the arm-holes, and thence ſending branches into the upper ribs, ſhoulder and chanel bone, it deſcends down to the bowing of the Elbow.*

Azygos vein, *is a branch of the upper Trunck of the* Vena Cava, *ariſing on the right ſide.*

B

Balneum Mariæ, *Is a way of diſtilling with a Glaſs-belly, holding the Ingredients put into a Veſſel of water, and ſo fire being made under it, it diſtills with the heat of the water.*

Balſamic, *Balſamie or belonging to Balſam.*

Baſilick Vein, *A large Vein into which the* Axillarie *vein is carried, called alſo the* Liver vein.

Baſis, *The foundation or foot of a thing.*

Bechicks, *Medecines againſt the Cough.*

Belly, *Upper, the head ſo called. Middle, the region of the ſtomach. Lower, The parts below the Midriff, containing the Inteſtines.*

Bezoartick, *Belonging or made of the precious ſtone* Bezoar.

Bezoar, *A precious ſtone brought out of the* Indies *very* Cordial.

Bile, *Choler.*

Bilary, *Belonging to Bile or Choler, ſometimes applyed to the veſſel containing the Choler.*

Bipartite, *Divided into two parts.*

Bolus, *Is a Medecine made up into a thick ſubſtance to be ſwallow'd not liquid, but taken on a Knives point.*

Botonick, *Pertaining to herbs or herby.*

Brachial, *Belonging to the Arm.*

Bronchia, *The griſly parts about the wind-pipe*

Buboes, *Filthy ſwellings about the groin.*

C

Cachexia, *An evil diſpoſition of the Body when all the nutriment turns into evil humours.*

Cachectical, *To ſuch evil ſtate or diſpoſition be-*

belonging, or one troubled with ſuch evil diſpoſition.

Cachochymical, *Full of evil and bad juice in the body, of very ill digeſtion.*

Callous, *Hard, fleſhy and brawny.*

Calx, *Aſhes, Lime, ſometime taken for the remaining parts of things Chymically drawn off.*

Capillaments, *Small hairy threds of the Nerves.*

Caput mortuum, *The dead head, being the laſt thing remaining after ſeveral Chymical extractions and good for nothing but to be flung away, all virtue being extracted.*

Carbuncle, *A red fiery ſore; a Plague-ſore.*

Cardiack, *Cordial, or belonging to the Heart.*

Carotides, *Two arteries which ariſing out of the Axillarie Artery, are carried thorow the ſide of the Neck upwards into the skull.*

Carthamums, *A little ſeed uſed in Medecines.*

Caruncles, *Little peices of fleſh.*

Cartilage, *Is a griſtle or tendril, a ſubſtance ſomewhat ſofter than a bone, and harder than a Ligament.*

Cartilaginous, *Griſtly, or belonging to, or full of ſuch griſtles.*

Caſſia, *A ſweet ſhrub like Cinamon, alſo a drug that purgeth.*

Cataplaſm, *A Poultis or aſſwaging Plaiſter.*

Catarrh, *A great Rheum falling from the head into the mouth.*

Cathartic, *A purging Medecine.*

Cava vena, *The great Liver-vein going thorow the Body.*

Cavity, *Hollowneſs.*

Cauſtic, } *A Compoſition made to burn a hole in*
Cautery, } *the skin and fleſh to make Iſſues.*

Celiac veſſels, *Veſſels belonging to the Belly.*

Celebrated, *Performed or done.*

Cephalalge, *The Head-ach.*

Cephalic, *Belonging to the head, a Medecine proper for the head.*

Cephalic vein, *Which ſpringing out of the Axillary vein, paſſes between the firſt and ſecond muſcle of the ſhoulder, and ſo paſſes evidently into the Arm.*

Cephalic Artery, *Conſiſts of two branches which ſpringeth out of the great Artery, aſcend up into the head.*

Cerebel, *The hinder part of the Brain from whence the Nerves proceed that ſerve to the vital function.*

Cervical, *Belonging to the Neck.*

Chalybeat, *A Medecine made of prepared Steel, or belonging to Steel.*

Characteriſtical, *The notes, ſigns or figures belonging to a Character.*

Chloroſis, *The Green-ſickneſs, or the virgins diſeaſe.*

Choleduc veſſels, *The veſſels that hold and ſend forth the Gall.*

Chorodeidal, *Belonging to the Net, like to the infoldings about the Brain.*

Chyle, *Is the juice or ſubſtance of of the meat digeſted.*

Chylification, *The making of Chyle.*

Chyme, *Is the juice of the meat further digeſted.*

Chronical, *Long and tedious diſeaſes.*

Circumpulſion, *A driving about.*

Claſſes, *Forms or Orders.*

Coalition, *Nouriſhment.*

Coagulation, *A curdling like milk, a turning into a Curd, or a ſeparation of the parts like Curds and Whey.*

Coagulum, *Any thing that cauſeth ſuch a curdling, as Rennet.*

Coagulated, *Curdled.*

Coction, *Boiling or ſeething, alſo digeſtion.*

Cohobation, *A dreyning or pouring off from a ſettlement.*

Coindications, *Things to be conſidered with the diſeaſe, alſo ſigns beſides the diſeaſe it ſelf.*

Colcothar, *Droſs of mettals.*

Colical, *Belonging to the diſeaſe called the Colick.*

Colliquation, *A melting together.*

Collation, *A comparing or coupling together.*

Collated, *Compared or Coupled together.*

Colliſion, *A ſtriking or knocking together.*

Colocynthida, *Or Coloquintida, a bitter purging Gourd or Apple.*

Colon, *The fifth Gut, or that great Gut in which is ſeated the diſeaſe called the Colick.*

Colluvies, *A filthy heap of any thing.*

Commiſſures, *The joynting or joyning of things together, as of the skull bones.*

Complication, *A folding together.*

Conarium, *A Kernel ſticking to the outſide of the Brain in form of a Pine-apple.*

Concatenation, *A chaining or joyning together.*

Concatenated, *Joyned, tyed, or faſtned together.*

Conflagration, *A burning out, or being in a flame, as in Great Feavers.*

Conformation, *The framing, faſhioning or diſpoſition of a thing.*

Congelation, *A Freezing or gathering together into an hard ſubſtance, as Ice of water.*

Congeled, *Frozen, ſtiffned.*

Congeſtion, *An heaping or gathering together.*

Conjugation, *A yoking together, a derivation of things of one kind.*

Conſiſtency, *Thickneſs or ſubſtance, as a Jelly.*

Convolutions, *Roulings about or together, a twiſting together.*

Contexture, *A weaving together, or a framing or compoſition.*

Copula, *A Joyning or faſtning together, fettering.*

Corollary, *Addition, vantage, overplus.*

Corroſive, *Gnawing, eating, corroding.*

Corrugations, *Wrinkling together.*

Cortex, *The bark, ſhell, peel, or rind.*

Cortical, *Belonging to the bark, or rind, or peel of a thing*

Craſis, *The diſpoſition, complexion, temperature or mixture of natural humours.*

Craſs, *Thick.*

Craſſament, *A thickneſs or thick ſetling, as of dregs.*

Cribrious, *Sivelike, or that hath holes like a ſieve.*
Crude, *Raw, undigeſted.*
Crudities, *Raw and undigeſted humours, or rawneſs, or undigeſtion of any thing.*
Criſis. *Is the time of the turn of the diſeaſe when it either increaſes or diminiſhes, always obſerved by the Phyſitians.*
Critical, *To the Criſis, or ſuch time belonging.*
Cremaſteral, *Muſcles belonging to the Teſticles.*
Crural, *belonging to the Leg.*
Crucible, *An earthen veſſel uſed to melt Metal with.*
Cucurbite, *A Glaſs-body with a great Belly, uſed in diſtillations.*
Cuneform, *Wedge-like or in form of a Wedge: A bone ſo ſhap'd.*
Cutaneous, *Belonging to the skin, or skinny.*
Culinarie, *Belonging to the Kitchin.*
Cuticula, *The little thin skin under the Cutis or the upper skin.*
Cutis, *The upper or outward skin of the Body.*

D

Dead head, *The ſame with* Caput mortuum.
Decapulation, *A pouring off.*
Defection, *A failing, weakneſs or infirmity.*
Decoction, *A boyling or ſeething.*
Defecated, *made free from dregs.*
Deflagration, *A flaming or burning forth.*
Diliquium, *As of the ſalt of* Tartar, *a clear draining, alſo a ſwooning away, or a failing of the ſenſes.*
Dilirium, *A raving madneſs, as in Feavers.*
Deltoides, *A muſcle in the top of the Arm, having the figure of a* Delta, *the* Greek *D.*
Demerſed, *Drowned.*
Depauperated, *Made poor or waſted.*
Depraved, *Corrupted or marred.*
Depurated, *Cleanſed from dregs.*
Depuration, *A cleanſing or making pure.*
Deſultory, *Leaping, wavering or inconſtant.*
Diabetes, *The Piſſing evil; a diſeaſe that cauſeth the party troubled therewith almoſt continually to piſs, and in a great quantity a clear and ſweetiſh water.*
Diocodium, *A Syrup to procure ſleep, made of the tops of* Poppy.
Diagnoſis, *Dilucidation, or Knowledge.*
Diagridium, *See* Scammony.
Diaphoreſis, *Evaporation, as by ſweating.*
Diaphoretic, *That cauſeth Evaporation or ſweating forth of humours.*
Diaphanous, *Clear and ſplendid.*
Diaphragma, *The Midriff that ſeparateth the Heart and Lights from the ſtomach.*
Diopneon, Diapnoe, *A breathing forth.*
Diarrhæa, *A looſneſs of the Belly, without inflammation, a Lask.*
Diaſcordium, *A Cordial medicine made of* Scordium *and other Ingredients.*
Diaſtole, *The riſing up of the Heart or Artery, the contrary motion of Syſtole.*
Diatheſis, *The affection or diſpoſition.*
Diluted, *Rinſed or waſhed.*
Dilucidation, *An explaining or clearing.*
Dioptric, *Belonging to the Perſpective, or a Mathematical Inſtrument, thorough which they look to take the height of a thing.*
Divarications, *A varying or ſevering into parts running up and down, as the Veins and Nerves.*
Diverſory, *A diverting place, or a place to turn of one ſide out of the way.*
Diureſis, *Evacuation by Urine.*
Diuretick, *A Medecine that cauſeth evacuation by Urine.*
Dogmatic, *Stiff in Opinion.*
Duodenum, *The firſt Gut or Inteſtine of twelve fingers long.*
Dura mater, *The hard membrane or tunicle that encompaſſeth the brain next the skull.*
Dyſcraſie, *Intemperature, as ſome humour or quality abounding in the Body.*
Dyſentery, *A flux of the Belly that corrodes the Bowels and often cauſeth blood, called then the* Bloudy flux.
Dyſpathy, *A contrariety of affection.*
Dyſpnœa, *A purſineſs or ſhortneſs of breathing, and a ſtopping of the Conduits of the Lights.*

E

Ebullition, *A boiling up.*
Eccentric, *Without Centre.*
Eccathartic, *Not purging.*
Eccritic, *Not critical.*
Edulcorated. *Made ſweet.*
Effervency, Efferveſcency, *A being very hot or inflamed.*
Effluvia, *Things that flow out of the Body, as ſteam and breath thorough the pores of the skin.*
Egeſtion, *A caſting forth as ordure from the body, or any excrementitious homour.*
Egritude, *Sickneſs or not being well.*
Elaſtick, *That goeth off with a force like Gunpowder, or ſpreads forcibly forth with a jerk.*
Elaterium, *A violent ſtrong purging Medicine.*
Elixation, *A boyling.*
Elixir, *An* Arabian *word for Quinteſſence, high Cordials ſo called.*
Elogy, *A report in praiſe or diſpraiſe of a thing.*
Emanations, *Things that flow or proceed from the Body or its parts; flowing forth.*
Embryo, *The Child before it hath perfect ſhape in the mothers womb.*
Emiſſaries, *Places that ſend forth any thing as the ſinks of the body.*
Empirical, *Belonging to an Empirick or of knowledge in Phyſick, got by practice only.*
Empiric, *Such a Phyſitian who hath no Judgment, but has all his skill from practice, or by experiments.*

Empyema,

Empyema, *An Impoſthume or collection of corrupt matter with inflammation between the breaſt and the Lungs.*

Empyreuma, *A ſmatch or taſte of the fire, as burnt too, or as in moſt waters newly drawn off by diſtillation.*

Emulgent, Emulging, *Veſſels or Arteries, or veins: two large Arteries ſo called ſpringing out of the great Artery, which being carried near to the back bone are inſerted into the Reins. Alſo two large Veins which ſpringing out of the* Vena Cava *under the Ventricle, are carried into the Kidnies.*

Emunctories, *Sinks or cleanſing places for the Body.*

Encephalon, *The head and all its parts.*

Enema, *A Cliſter.*

Energy, *The force or operation, or virtue of a thing.*

Enervation, *Unnerving, or a looſing of the ſtrength, a weakning or making feeble.*

Enthymiama, Enthymeta, *Medecines uſed to expreſs the flowing of the Blood or other humours to any place.*

Ephemera, *Things of a days laſting: A ſhort Feaver of a day.*

Epidemical, *General, univerſal, publick.*

Ephidorſis, *A ſudden ſweat beginning about the head and breaſt paſſing over the body, unprofitable and of ſmall uſe for that evacuation of the diſeaſe: Sometimes taken for ſweating.*

Epigaſtric, *Belonging to the* Epigaſtrium.

Epigaſtrium, *The ſame with* Abdomen, *or the outward part of the Belly, from the Navel to the privy members.*

Epilepſie, *The Diſeaſe called the* Falling-ſickneſs.

Epiphyſis, *Is an addition of ſome bone of a different deſcription to the true bone to which it is annexed: an addition or augmentation.*

Epiſpaſticks, *Certain Medecines uſed for the drawing forth of ulcerous matter.*

Epithema, *Moiſt Medecines uſed to bathe or foment the parts affected.*

Epithymum, Dodder of Time, *uſed to purge Melancholy.*

Equinox, *When the day and night are of an equal length, about the twelfth of* March, *and the twelfth of* September.

Eradicated, *Rooted out.*

Erratic, *Creeping, wandring, or ſtraying.*

Eſcharotic, *A Plaiſter or Salve to heal up a wound, and to bring it to a Cruſt.*

Etymology, *The true Expoſition or interpretation of a thing.*

Evident, *Plain, clear, manifeſt.*

Eventilated, *Fannowed, or that receives wind.*

Euphorbium, *The Gum of a certain Tree ſo called.*

Excandeſcency, *A growing very hot and burning.*

Excern, *Thruſt out, to purge, or ſift forth.*

Excrementitious, *Belonging to Excrements: filthy, polluted.*

Excretion, *A voiding the Excrements, or ſuperfluities of the body.*

Excretory, *To ſuch a thing belonging, that puts forth the Excrements of the body.*

Exceſcencies, *Things that grow forth out of the body, or any other thing beſides the body, or thing, as Warts or pieces of fleſh.*

Exert, *To ſhew or put forth.*

Exitition, *A ſparkling, boiling, bubling, or leaping up, or forth.*

Exonerate, *To disburden, or diſcharge, to purge forth.*

Expanſion, *A ſtretching forth, ſpreading abroad, or inlarging.*

Expanſed, *Spread out at large, or ſtretched forth.*

Expatiated, *A running forth or about, enlarged.*

Exploſion, *A driving forth with violence.*

Exploded, *Thruſt forth, or driven out.*

Extravaſated, *Put, or let forth of the Veſſels as Blood out of the veins.*

Extraneous, *Strange, or of another kind.*

Extirpated, *Rooted out, or plucked up by the Roots.*

Extricated, *Delivered, or unintangled.*

Exuberances, *Swellings forth, or riſings up, in the fleſh or other parts.*

F

Fæces, *Dregs.*

Fæculencies, *Dregs or ſettlements.*

Farciments, *Stuffing or fillings of any thing.*

Fermentation, *A fermenting or working, like leaven.*

Fibrils, *Little ſmall ſtrings of Fibres, or of the Nerves or Veins.*

Fibres, *The hairy ſtrings of the Nerves and Veins.*

Fibrated, *That has ſmall and hairy ſtrings.*

Filaments, *Little, thin, ſlender Rags like threds, ſuch as appear in Urine.*

Filter, *To ſtrain: A Strainer.*

Fiſſures, *Clefts, chaps, or diviſions.*

Fiſtulous, *Belonging to a Fiſtula, or ſore running Boil.*

Flatulent, Flatuous, *Windy or full of Wind.*

Fluor, *A Flux.*

Fluid, *Flowing or running.*

Fluidity, *Apt to flow, flowing or wetneſs.*

Fornix, *An hollow place in the Brain, bending like an Arch.*

Forum, *A place in* Rome *where Judgments were given, and cauſes decided.*

Friable, *That may be rubb'd to pouder between the Fingers.*

Fricſions, *Rubbings.*

Fuliginous, *Sooty, or belonging to Soot.*

Functions, *The Exercises or discharging of some Offices.*
Fuse, *To melt as Mettals.*
Fused, *Melted or running, as Mettals made liquid.*
Fusion, *A pouring forth, also a melting of Metals or other things.*

G

Ganglia, *Things like the heads of* Mushrumps *in the body.*
Ganglioformi, *Of the shape of* Ganglias, *or the heads of* Mushrumps.
Galen, *An ancient learned Physitian.*
Gargarisms, *Medecines to cleanse the mouth and Throat, and to wash them from filth.*
Genesis, *Beginning, Nativity, or Generation,*
Genuine, *True or natural.*
Germination, *A springing or budding, or sprouting forth, as of Trees in the spring.*
Gesticulation, *A wanton moving up and down of the Legs and Arms or other parts of the body, like a Tumbler or Mimick.*
Glandulas, *Are little round Kernels everywhere up and down in the flesh and other parts.*
Glutæi, *Muscles of the Thigh.*
Gonorrhea, *The running of the Reins, a flux of seed or matter at the privy parts of man or woman.*
Grumous, *Clottery like blood when congealed.*

H

Hæmorrage, *An excessive flux of Blood at the nose or elsewhere.*
Halos, *A Circle about the moon or stars.*
Hellebore, *The root of an herb used in Physick, two sorts, white and black.*
Heptic, *Belonging to the Liver, and a Medecine proper to cure the diseases of the Liver.*
Hermodactils, *Or Mercuries finger, white and red, used in Medecines.*
Heterogeneous, *Of an other kind or Genus, strange, not agreeing.*
Homogeneous, *of the same kind or Genus, agreeable, and sorting.*
Horizon, *The Circle of the Firmament, terminating our sight.*
Humid, *Moist, wet.*
Hydropic, *That hath the Dropsie, or belonging to the Dropsie.*
Hydrotic, *A medicine evacuating watery humours.*
Hydragogues, *Medecines that will draw forth the watery humour of those who have the Dropsie.*
Hyoeides, *A forked bone like the letter* Y, *so called of the* Anatomists, *consisting of divers small bones which are the ground or foundation of the muscles of the* Larynx, *and the Tongue, and helps to breathing, and swallowing down meat and drink.*
Hypercatharsis, *Overpurging, or in extreme.*
Hypochondria, *The* Præcordia: *The forepart of of the Belly and sides about the short Ribs and above the Navel, under which lyeth the Liver & the spleen.*
Hypochondriac, *A windy Melancholy, bred in the* Hypochondria, *from whence a black phlegm arises that infects and troubles the mind, one troubled with such melancholy.*
Hypnotic, *A medecine that causeth sleep.*
Hypogastrium, *The lower part of the Belly, which reaches from the Navel downwards to the privy parts.*
Hippocrates, *A learned ancient Physitian, and the first methodizer of Physick, and made it Artificial.*
Hippocrates sleeve, *A long woollen straining bag, sharp at the bottom, so called, being almost in fashion of a sleeve or Doublet.*
Hypothesis, *An argument or matter about which one may dispute.*
Hypostasis, *A substance or settlement, such as is in the bottom of an Urin.*
Hysterical, *Belonging to the womb or mother, or troubled with the disease called the* Mother.

I

Jalap, *A purging Drug.*
Ichor, *The matter or corruption running forth of a sore or Ulcer.*
Idocrasie, *The proper disposition or temperament of a thing or body.*
Idiosyncrasie, *The property of the Temperament of Bodies.*
Idiopathic, *Belonging to the proper passion of a disease, thing or body.*
Idiopathy, *The proper passion of a disease.*
Idea, *The form or figure of a thing conceived in the Imagination.*
Ilion, *The third Gut from the Ventricle, wherein the digested food or Chyle waxing thicker begins to rest; the thin Gut or small Gut.*
Iliac, *Belonging to the Colick: The Colick in extremity. Iliack passion.*
Imbecillity, *Weakness, feebleness.*
Impervious, *That cannot be passed or gone thorow.*
Impetigo, *A certain kind of dry Itch or scurf like the Leprosie.*
Impetuous, *Violently or with force, as it were rushing upon a thing.*
Impregnated, *Filled full with the vertue of a thing, as when any thing is infused in a liquid body, communicating its vertue to it.*
Inanition, *Emptiness.*
Incitement *A stirring up or provoking.*
Indication, *A shewing or manifesting by sign.*
Indomitable, *Untamable, that cannot be subdued.*
Inflated, *Blown or puffed up as a Bladder with wind.*

In-

Ingeſtion, *A putting or pouring into a thing, as meat and drink into the ſtomach.*
Inguinal, *belonging to the Groin.*
Inordination, *Diſorderings, irregularities, or out of order.*
Inſipid, *Without taſte or ſmack.*
Inſpiration, *A Blowing in, or a drawing in of the breath.*
Intenſe, *Strong, Violent, Great.*
Intercoſtals, *Between the Ribs, Nerves, ſo called, becauſe deſcending from the brain, they run between the Ribs, and ſo deſcend to the Inwards.*
Internodia, *Between the joynts or knots, as the ſpaces in a Ratoon Cane between the joynts or knots.*
Interſtitia, *The ſpaces between other diſtances as the ſpaces between the Ribs, or the joyntings of the back-bone.*
Internuncius, *A meſſenger that goes between.*
Inteſtines, *The entrails or the Guts.*
Intrinſical, *Inward.*
Inverſe, *A turning inſide out, or outſide in, upſide down, quite contrary.*
Inverted, *Turned wrong-ſide out or upſide-down; quite changed from its natural ſcituation.*
Involuntary, *Not with the will, unwilling.*
Irradiation, *A beaming forth or caſting forth beams like the Sun. Sometimes applyed to the ſpirits beaming themſelves forth, or running forth from their centre like beams.*
Irrigation, *A watering, wetting or moiſtening.*
Irritate, *To provoke, anger, or ſtir up.*
Irritated, *Provoked, anger'd, or ſtirred up.*
Iſchuria, *The diſeaſe of the Bladder; the ſtoppage of the water, when it cannot come forth but by drops and with pain.*
Iſchuretical, *one ſo troubled with that diſtemper.*
Jugular, *Belonging to the Throat, the throat-vein and Artery.*
Julap, *A cooling Cordial, or a mixed Potion to cool and refreſh the heated ſpirits, uſed in Feavers.*

L

Lactiform, *Like milk, or in the form of milk.*
Languor, *Feebleneſs, failing or decay of ſtrength, fainting, or weakneſs of Spirits.*
Larynx, *The top of the Aſper Artery, or the head thereof, which reacheth up to the Mouth or Jaw, which with the bone* Hyoides *joyned thereto, ſerves for breathing and forming of the voyce, or the air into articulate ſounds.*
Laſſitude, *Wearineſs and irkſomneſs.*
Lateral, *Belonging to the ſide.*
Latex, *Liquor or Juice of any ſort in the body.*
Laudanum, *A Medecine uſed by Phyſicians to cauſe reſt, given in difficult Caſes.*
Lienary, *Belonging to the Spleen.*
Leipothymy, *A ſwooning or fainting away of the ſpirits.*
Lethiferous, *Deadly, that cauſeth death.*
Leucophlegmacy, *The kind of Dropſie that ariſeth of white Phlegm throughout all the body, and makes the fleſh ſpongy.*
Ligature, *A band or ſtring bound hard about the Arm, Leg or any other part of the Body.*
Limature, *The powder or duſt that cometh of fileing, the fileings of Steel and other mettals.*
Limpid, *Clear, pure, and bright like water.*
Linctus, *A Medecine that is to be lick'd with the Tongue.*
Liniments, *Ointments.*
Lixivial, *Belonging to lie made of aſhes.*
Lobes, *Lappets, or ſuch as the Liver is diſtinguiſhed into.*
Lochia, *All that comes away from a woman after ſhe is brought to bed.*
Locomotive, *That moves from place to place.*
Lucophlegmacy, *See* Leucophlegmacy.
Lumbary, *Belonging to the loyns.*
Luxuriat, *To grow rank or abound.*
Limphic, Limphatic, *Veſſels: That carry or contain the wateriſh humours of the body.*
Limpheducts, *Water-Carriers, or Conveyors, the ſame ſort of Veſſels which carry forth the wateriſh humours.*

M

Magma, *The blended droſs and faces of ſeveral Mettals, as alſo of Chymical Extractions.*
Mammillary, *Proceſſes in the Temples, Bones hanging down like broken brows of Banks repreſenting the faſhion of Teats and Cows Udders.*
Manſorius, Maſſoterie, *A Muſcle, which ſpringing up circularly from the Throat bone of the upper Jaw, moveth the nether Jaw.*
Mandible, *The Jaw wherein the Teeth are ſet.*
Maſtic, *A certain Medecinal Gum.*
Maſticator, *The Pipe or Conduit that conveys the pituitous matter out of the Head into the Mouth.*
Matrace, *A Veſſel uſed for Chymical Diſtillations.*
Maturation, *A ripening.*
Maxilary, Maxillar, *Belonging to the Jaws.*
Mechoacan, *A purging Drug brought from the* Indies.
Meconium, *The juice of the Leaves and heads of* Poppy.
Medaſtinum, *Or* Mediaſtinum: *The thin membrane that divides the middle belly or the Breaſt, from the Throat to the Midriff into two boſoms or hollows: One on the right ſide, the other on the left.*
Medullar, *Marrowy, or belonging to the marrow or pith, or the white ſubſtance of the Brain.*
Membranes, *The little thin skins joyning the bones and ſinews together in ſeveral parts of the body: The upper thin skins of any part.*
Meninges, *The thin skins that enwrap the Brain,*

both of the pia mater & dura mater: *one called the hard, the other the ſoft Meninx.*

Menſtruum, *A preparation made by Chymiſts to diſſolve metals, alſo to extract tinctures and the virtues of medecinal druggs, woods, flowers, herbs,* &c.

Meſentery, *A certain thick fat skin, or the double skin that faſtens the bowels to the back, and each to other.*

Meſeraic, *Veins ariſe, or are rather incloſed in the* Meſentery, *being branches of the great vein, by which the Guts are nouriſhed, and the juice of the meat concocted, is conveyed to the Liver to be made blood.*

Mercurie, *Quick-ſilver, and its preparations of it.*

Metaphyſical, *Supernatural; things of ſublime ſpeculations beyond nature.*

Metaſtaſis, *Is a tranſlation, or when a diſeaſe removes out of one place into another.*

Metatheſis, *Is tranpoſing, the putting of one thing for another.*

Miaſm, *Infection or taint.*

Microſcope, *A Perpective-glaſs to behold minute, and very ſmall bodies, a Magnifying glaſs.*

Millepedes, *The hundred-feeted Creature, and Heſlog-ſows, or Hog-lice.*

Mirabolans, *A certain medecinal fruit brought out of the* Indies.

Modifications, *A meaſuring or bringing into meaſure.*

Morbid, } *Sick, corrupt, filthy, or naughty.*
Morbifick, } *That cauſeth the Sickneſs or diſeaſe.*

Mucilage, *Thick boiling up of a thing to a jelly, or thick conſiſtency.*

Munited, *Defended or fortified.*

Muſcle, *Parts of the body that ſerve for motion, ſofter, and more fleſhly than the ſinews.*

Muſculous, *Full of Muſcles, or belonging to the Muſcles.*

Myology, *The Doctrine of the Muſcles.*

N

Narcotick, *Stupifactive, or that makes the part ſenſleſs.*

Nates, *Two prominences in the Brain, ſo called becauſe in the form of Buttocks.*

Natiform, *In the form of a Buttock.*

Neoterics, *People or men of late Times.*

Nepenthe, *A drink to drive away melancholy.*

Nephritis, *A pain in the reins of the back, alſo the Stone or Gravel in the Reins.*

Nephritic, *One troubled with the pain in the Reins.*

Nerves, *Are the ſinews which convey the ſpirits that ſerve for life and motion through the whole body.*

Neurologie, *The doctrine of the Nerves.*

Nitre, *That is uſually called Saltpetre: A ſalt taken out of the earth.*

Nitroſulphureous, *Nitre mix'd with Sulphur, or of a nitrous and ſulphureous nature or quality.*

O

Oblique, *Croſs, traverſe, aſlope, not ſtraight or right.*

Oblong, *Longiſh or ſomwhat long.*

Oeconomie, *A certain order of doing any thing, an houſhold rule, regiment or governance.*

Oeſophagus, *The mouth of the ſtomack.*

Olibanum, *An outlandiſh Gum.*

Opiologie, *The doctrine of Opium.*

Opium, *Made up of the juice of wild poppie, uſed to ſtupifie and bring into a ſenſleſs ſleep.*

Opiats, *Medecines made of Opium for ſome part if its ingredients to cauſe ſleep and eaſe for pains.*

Optic, *Belonging to the ſight, as the Nerves that bring the vertue of ſeeing to the eyes.*

Opopanax, *The juice made of a certain herb.*

Ophthalmic, *A medicine to cure the diſeaſes of the eyes.*

Orgaſm, *Rage or fury.*

Orifice, *The hole of a wound, or the mouth of any thing.*

Origine, *Beginning, riſe or birth of a thing.*

Orbicular, *Of a round form or ſhape.*

Orthopnœa. *Is ſuch a ſtraitneſs of breath, that one cannot breath, or fetch breath without ſtretching out of the neck, or holding it upright.*

Os Pubis, *Is the bone at the bottom of the belly, juſt above the privie member.*

Os Sacrum, *Or the ſacred bone, is the great bone upon which the end of the ridge or back-bone reſteth.*

Oviparous, *Egg-bearing Creatures, or that lay Eggs.*

P

Panacea, *All-heal, or a plaiſter or medicine to heal all things.*

Pancreas, *Called in a Hog the Sweet-bread. It is a remarkable kernel placed below the Ventricle, and ſerves for a diviſion of the* Vena porta, *as alſo to defend the Ventricle from touching the back.*

Papillary, *Belonging to the Teats, or like paps or teats of a dug.*

Papillæ, *Little paps, or little pieces of fleſh in the body, ſo called of the ſhape of paps.*

Paracenteſis, *Is an inciſion made to draw forth the water from thoſe ſwelled with the Dropſie, vulgarly called a Tapping.*

Paracelſus, *A famous Dutch Emperick,*

Paradox, *A thing contrary to the common opinion,*

Paralytick, *That is troubled with the Palſie.*

Parallel, *Equal, alike, like a line drawn to write by another.*

Parotida, Parotides. } *The two chief Arteries and Veins on the right and left side the throat, going up towards the ears.*

Parotid, *To them belonging.*

Particles, *Little parts or portions of any thing.*

Paroxisms, *Fits, or the returns of fits, as of an Ague or Feaver.*

Pathetic, *To passion belonging, Nerves so called by Dr.* Willis.

Pathologie, *The doctrine of the passions, also as Ætiologie.*

Pathognomic, Pathognotic, } *That moveth the affections, or that properly belongs to the thing.*

Pepasmus, *A kind of a concoction of the humors in the disease.*

Percolation, *A straining thorow.*

Pericardium, *The thin skin or membrane covering the whole heart like a case.*

Peritonæum, *The inner skin or rim of the belly joyned to the Caul, wherewith all the Intrails are covered, called by the Anatomists* Siphach.

Peripneumonia, *An Inflammation or Impostume of the Lungs, with a short ness of breath.*

Perisstaltick, *Motion, a certain motion compassing about as in certain convulsions.*

Perspiration, *Breathing thorow, as sweat through the pores of the body.*

Perturbations, *Disturbings, vexing troubles, disturbances.*

Pervious, *That may be passed through, or that has a passage or way through it.*

Peruvian, *Belonging to the Country of* Perue, *as* Peruvian, *Balsom thence brought.*

Pharmacy, *The Medicines of the Apothecaries; or the art of making them up.*

Pharmaceuticks, *The part of Physick that cureth with Medicines.*

Phænomena, *Appearances of things.*

Philonium, *A Confection made of many ingredients compounded together.*

Philtre, *A potion to cause Love; or poysonous Medicines that operate magically, or not naturally.*

Phlebotomie, *Letting blood or opening of a Vein.*

Phlegmon, *An inflammation of the blood, with a red swelling.*

Phlegosis, *The like Inflammation fiery red.*

Phthisis, *The Consumption of the Lungs, with a wasting away.*

Phthisic, *Belonging to that disease, or that has it.*

Physiologie, *The reasoning of the Nature of a thing, or the searching it out.*

Pia Mater, *The thinner inward soft skin that inwrappeth the pith and marrow of the brain, and is every where joyned to it; called the thinner and soft Meninx,*

Pica, *The longing disease of Women with Child.*

Pineal, *Kirnel in the brain, in form of a Pine-apple, called also* Conarium.

Pituitous, *Snotty thick phlegmatick matter.*

Plastic, *Formative or that worketh and formeth.*

Plenitude, *Fulness or store.*

Plethora, *A fulness or plenty of humours in the body, good or bad.*

Pleura, *A skin or membrane which clotheth the ribs on the inside, which being inflamed by the blood, causeth the Disease called the Pluritie.*

Pneumatic, *Windy or belonging to wind or breath.*

Pneumonic, *One sick of the disease of the Lungs.*

Polypus, *A filthy disease in the nose, breeding stinking and ulcerous flesh within the nostrils.*

Pontic, *Belonging to the Sea or to the Country of* Pontus.

Porta Vena, *Is a Vein that hath many small roots fastened to the Liver, from whence arising grow into one trunck or stock, which going forth from between two eminent lobes of the Liver, passes into the Gall, Ventricle, Spleen, Mesentery, and Caul, and other parts of the body.*

Pores, *Are the little small holes or breathing places in the skin of the body, through which heat and moisture insensibly breath continually.*

Porous, *Full of such like holes or pores.*

Praxis, *Practice or action.*

Præcipitation, *A casting down; used by the Chymists for a certain way of distillation, when the matter is thrown back into the receiver.*

Præternatural, *Besides or more than natural; not natural or besides nature.*

Præceding, *Going before.*

Prævious, *That went before.*

Præcordia, *The parts about the heart, as the Diaphraghma, or midriff separating the heart from the other bowels.*

Præmised, *Sent before, or before made known.*

Præpolency, *Of very great force, strength, excellency, or virtue.*

Priapismus, *Is a disease in the Yard, that causeth it alwayes to be stretch'd forth, and extended without any thing provoking it.*

Primigenious, *The first original; not having its beginning or birth of another.*

Procatartic, *Remote, not next cause of a disease.*

Processes, *The parts of a bone (or other parts) that exceed the natural height or posture, and are yet dependances of the bone and parts, and proceed or go out from it; as also some Nerves going forth of other Nerves, being still parts of the main stock.*

Profusions, *A pouring forth, a running or spreading abroad.*

Profluvium, *A flowing of humors, a gushing forth in abundance, a flood.*

Profligated, *Driven away, or overthrown, discomfited.*

Prognosis, *The prescience or fore-knowledge, or Prognostication of the event of the disease.*

Promptuary, *A Store-house, or place where any thing is laid up.*

Prominences, *Bunchings forth, those parts that notably shew themselves above the rest, as a hill in a plain.*

Prophasis, *The appearing or shewing of a thing.*

Prophylactic, *That part of Phyſick that preventeth and preſerveth from diſeaſes.*
Proſtatæ, *Kernels in the Groyn, or about the privie-members.*
Protenſion, *A ſtretching forth at length.*
Protraction, *A drawing forth at length, alſo a prolonging.*
Protuberance, *A bunching forth above the reſt.*
Protruſion, *A thruſting forward.*
Pſoa, *A great muſcle beginning at the* 11th. *rib and going through the bowels to the privie-members.*
Pſora, *The ſcabbado, or ſcabbineſs with puſtles.*
Ptyaliſmus, *Sallivation, or a great flux of ſpitting.*
Ptiſan, *Decocted Barly, with other ingredients.*
Puretology, *The doctrine, or a diſcourſe of Feavers.*
Pungitive, *Pricking like needles.*
Purulent, *Full of matter or filthy corruption; as a Bile or Impoſtume.*
Pubis, *That part of the privie-parts where the hair grows.*
Pulſific, *That ſtrikes as the Pulſe or beating of the Arterie, or that cauſes ſuch ſtriking or pulſe.*
Pylorus, *Is the lower mouth of the ſtomach or ventricle, whereby the meat being digeſted, is tranſmitted into the Stomach-gut or Maw-gut.*
Pyramidical, *Of the ſhape or form of a Pyramide, broad at bottom and ſharp at the top.*
Pyretology, *The doctrine of Feavers, or of fire.*

Q

Quotidian, *Daily or every day: an Ague that comes every day.*
Quartan, *Every fourth day; an Ague that has two days of intermiſſion, and comes on the fourth day again.*

R

Ramifications, *Branchings forth like the Veins, Arteries and Nerves up and down the body, reſembling the ſmall twigs and branchings of Trees.*
Rarefaction, *a making of any thing rare or thin.*
Ratiocination, *Reaſoning, debating, or arguing of any thing, or the facultie of reaſoning.*
Reciprocation, *a returning back, or a mutual partaking of a thing, or depending on another by a mutual conſequence.*
Recrement, *Any ſuperfluous matter, or thing in the blood or body, or any of the parts.*
Redundancy, *Superfluity, overflowing too much of a thing.*
Receſſes, *The private and hidden parts of the body or any hid place.*
Refection, *A repaſt of meat and drink, a refreſhing.*
Refraction, *A breaking off, or rebounding back.*
Reflection, *A bending back or rebounding.*
Refrigerate, *To make cool, or to refreſh with cooling; as fanning one in great heat.*
Regurgitate, *To ſwallow up again; or to ſup up again what it before had parted with.*
Regulus, *The droſs of metals.*
Renal, *Belonging to the Reins.*
Reiterated, *Repeated, or the ſame thing done or performed again.*
Remora, *A ſtop, let, or ſtay to any thing; a figurative ſpeech taken from a little fiſh ſo called, which is ſaid by cleaving to the keel of a ſhip, to ſtay it in its courſe.*
Repletion, *A fulneſs or filling full, or abounding.*
Repullulate, *To bud or ſpring forth again, as trees in the Spring.*
Reſine, *A Chymical extraction of ſeveral druggs ſo called being in ſubſtance like to Roſine or Reſine.*
Reſpiration, *A breathing forth or a venting.*
Reſolution, *A diſſolving or unbinding, a looſning.*
Retort, *A Chymical Veſſel.*
Reverberatory, *A furnace by which matter is calcined or conſumed with the flame.*
Rhomboides, *A Geometrical figure with unequal ſides.*
Rhombus, *A Geometrical figure with equal ſides but not right angl'd, like a quarry of glaſs.*
Rhubarb, *A root brought out of the* East-Indies, *almoſt like a dock root, uſed to purge choler.*
Riſibility, *Laughter, or the faculty of laughing.*
Riverius, *A famous Phyſician.*
Rotation, *A going round like a wheel, a moving round.*
Rudiments, *the firſt beginnings and principles of things.*

S.

Saline, *Saltiſh or belonging to Salt.*
Salt-peter, *Or Salt of the Rock: a ſalt got out of the Earth, contracted from ſeveral dungs of Fowls or other Creatures, as Pigeons, Poultry, and Cattle, and from the Urines of Beaſts, and is one of the Ingredients of which they make Gunpowder, much uſed in Chymiſtry.*
Sal-prunella, *A Salt made out of Salt peter.*
Sal-ammoniacus, *A Salt of the Earth, found among the Sands in* Lybia.
Sal alcali, *Salt of aſhes made of the herb* Kali, *but uſed alſo for the ſalt of other herbs burnt to aſhes and ſo extracted.*
Salvatella, *Vein, is a branch, which ſpringing out of a Cephalick Vein, in the outſide of the Cubit, ſtretcheth above the wriſt and extream part of the hand, between the Ring-finger and the liitle finger.*
Salivate, *To ſpit or cauſe one to void much ſpittle.*
Salivation, *A great flux of ſpitting, or avoiding of ſpittle more than ordinary at the mouth.*
Sanguineous, *Bloody or belonging to the blood.*
Sanguification, *The making of blood, or the changing the nouriſhment into blood.*

Sanguiducts,

Sanguiducts, *The Veſſels that carry the blood through the body, as the Veins and Arteries.*

Sarſaparilla, A *drugg brought from the* Weſt-Indies, *uſed in many decoctions.*

Sagapenum, *A kind of Gum or Roſin that runs forth of the Shrub called* Ferula.

Scammony, *The juice of an herb which violently purgeth choler; it is alſo called* Diagridium.

Scapular, *Muſcle; a muſcle belonging to the ſhoulders, and ſerves for the moving of them.*

Scheam, *Is a figure or draught of a thing; alſo taken for an Aſtrological Table of the* 12. *Houſes.*

Schirri & Scirri, *Are hard ſwellings in the fleſh, without pain but hardly curable.*

Schirrous, *Full of ſuch hard ſwellings.*

Sclerotic, *That is troubled with ſome tumour in the third panicle of the eye, called the* Cornea membrana, *or ſomewhere thereabouts.*

Scorbutick, *That is troubled with the diſeaſe called the* Scorbute *or Scurvey.*

Scordium, *A uſeful herb in Phyſick, having leaves almoſt like Germander.*

Scotomies, Scotomie, *Turnings round; a diſeaſe in the head, when all things ſeem to turn round.*

Scrotum, *The outward skin of the Cods, where the hair grows.*

Scutiform, *In the form of a Shield or Buckler.*

Sedal, *Veins in the Fundament.*

Seclusion, *A thruſting forth or out.*

Secundine, *The After-birth, or that which inwraps the Child, which follows after the Birth of the Child; vulgarly called the After burthen; of Anatomiſts the* 4th. *membrane of the eye, called* Chorion; *and that firſt clotheth the optic ſinew is called the* Secundine.

Secretion, *A ſeparating or putting apart.*

Secreted, *Separated apart.*

Senna, *Or Sena, the leaves of a Plant, that Purgeth Phlegm, Choler and Melancholy.*

Senſory, *The organ of feeling, or diſcriminating by the ſences; the common ſenſory or ſeat of ſuch organ, placed in the brain.*

Septic, *That hath the force of corrupting or putrifying, or that maketh rotten or ripe the matter in a ſore.*

Series, *An order, courſe, or ſucceſſion of things, a row or courſe of things orderly one after another.*

Serous, *Humour, the whey or watery humour that accompanieth the blood, and which makes it fluid, and is ſeparated and put off from the blood into the parts of the body.*

Seroſities, *Such ſerous humours abounding.*

Serum, *The whey or watery humour of the blood, the ſubſtance of the ſerous humour.*

Sinus, *A boſom or hollow turning, or outlet of waters or an inlet or arm of the Sea.*

Soldanella, *Is the Sea-colewort or Folefoot.*

Solitive, *Looſening, or that maketh the body looſe.*

Solſtices, *Are two, the Summer and the Winter ſolſtice; the firſt is about the twelfth of* June, *when the Sun is neareſt to us and makes with us the longeſt day; the laſt is about the* 12 *of* December, *when the Sun is at its greateſt diſtance from us, and makes with us the ſhorteſt day.*

Solving, *Looſening or unbinding.*

Solution, *A looſening or weakning, as of the Nerves or joynts.*

Solvent, *That which diſſolveth or openeth the parts of the matter to be wrought upon.*

Spagiric, *Belonging to Alchymie, or to the Chymical art.*

Spaſms, *Cramps or Convulſions of the Nerves.*

Spaſmodic, *Belonging to the Cramp or Convulſion, or hauling of the ſinews.*

Spaſmology, *The doctrine of the Convulſion or Cramp of the ſinews.*

Speculative, *Contemplative or notional.*

Speculation, *A ſeeing or diſcovering a thing by contemplation.*

Species, *A kind more particular than Genus, and may be communicated to more generals; as a Cow and an Horſe are of a different ſpecies, but both Animals or Beaſts.*

Spermatic, *Belonging to the ſperm or ſeed,*

Sphaceliſmus, *A blaſting or a mortification of a part.*

Sphincter, *Is the round muſcle that encompaſſes the mouth of the Arſe gut, which keeps the excrements from an involuntary coming forth.*

Spine, *The back-bone, or long-joynted bone that goes down the back.*

Spina dorſi, *The ſame; the bone of the back, the Chine.*

Spinal, *Belonging to that bone.*

Spiral, *A turning about, and as it were aſcending.*

Splanchnic, Splanchnical, *Belonging to the Spleen.*

Splenitic, *Troubled with the diſeaſe of the Spleen.*

Spodium, *A ſort of ſoot made out of the making and trying of braſs.*

Spontaneous, *Willingly or of one accord, or by the command of the will.*

Sporadical, *That ſeiſeth not after an uſual manner, diſeaſes that ſeize privately here and there on People diſperſedly, not generally or epidemically.*

Squinancy, *Or Squincy, is a ſwelling in the throat, with an inflammation.*

Stagmas, *The mixtures of mettals, or other Chymical things ſet together to ferment and operate one upon the other.*

Stagnation, *A ſtanding ſtill without motion, as a pool.*

Sternothyroeidal, *Muſcle, A Muſcle which reaches from the* Sternon *to the* Os Pubis.

Sternon, *That part of the breaſt where the ribs meet.*

Stibium, *Antimony.*

Stiptic, *Or* Styptic, *that ſtraineth, bindeth, or is reſtrictive.*

Strumous, *That belongeth to the Kings evil, or he that hath that diſeaſe.*

Subclavian, *Veſſels: the veſſels that belong to the little ribs of the breaſt.*

Sublimate, *White Mercury, or Quick-ſilver Chymically ſublimed; Mercury ſublimate: of a poyſonous nature.*

Subſide, *To ſink down or fall to the bottom.*

Subſidiare, *That cometh for aid, or to help, or bringing aid or help.*

Subaction, *A kneading, working, exerciſing. or bringing under.*

Suffuſion, *A ſpreading abroad, or pouring forth.*

Sudation, *A ſweating.*

Sudorifick, *That cauſeth ſweating.*

Sulphur, *Brimſtone which is found in Mines in the Earth, taken alſo for one of the Chymiſts principles.*

Sulphureous, *Brimſtony, or belonging to Brimſtone.*

Superficies, *The outſide or overmoſt part of any thing.*

Suppuration, *A ripening or gathering together of the matter of a ſore.*

Surculs, *Little or ſmall ſhoots or ſpriggs.*

Sutures, *The joynings together of the bones of the head, which appear as if ſowed together with long ſtitches.*

Symptom, *Is an effect, accident or paſſion following any ſickneſs, or any ſenſible grief joyned with a diſeaſe, beſides the diſeaſe it ſelf, as Head-ach with a Feaver.*

Sympathy, *Is a natural paſſion of one thing to another, or an agreement in qualities.*

Sympathic, *Agreeing in affections or paſſions.*

Symphony, *A conſent or agreement in harmony.*

Sympraxis, *A joynt exerciſing or agreement in practice or action, a conſent in operation,*

Syncope, *A ſwooning, or a loſs of all ſenſe.*

Synochus, *Is a Feaver without changes or intermiſſions, a continual Feaver.*

Syntheſis, *A figure contrary to Analyſis; a conceſſion of ſome things ariſing from the matter.*

Syſtaſis, *Conſtitution.*

Syſtem, *The work or part of ſomething that is conſtituted or a theam or work compacted of ſeveral parts, a part of which is a Syſtem.*

Syſtole, *Is the motion of the heart and arteries, contrary to Diaſtole, by which they are contracted, but by this they are dilated.*

Syzygies, *Are the Nerves that carry the ſenſe from the brain to the whole body, alſo the conjunctions of the Sun, Moon and Stars.*

T.

Tabes dorſalis, *The mourning of the Chine; a waſting or conſumption of the back.*

Tabid, *Conſumptive, pining, or waſting.*

Tamarinds, *An outlandiſh fruit, good to quench thirſt and to allay the heat of choler, uſed in Medicines.*

Tarantula, *A little venomous creature found in* Apulia, *a part of* Italy, *whoſe poyſon being by biting diffuſed through the body, ſtrikes the Nerves with ſtrange tumors and Convulſions, which is only curable by the party ſo bitten, being provoked to continual dancing, by which means the poyſon is evacuated through the pores from the Nerves.*

Tartar, *Is a concreted matter taken from the Lees of Wine, very medicinable.*

Tenacious, *Holding or cleaving faſt.*

Tenaſm, *A great deſire of going to ſtool, and yet can do nothing.*

Tenous, *Thin, ſlender, or ſmall.*

Tendons, *Certain parts in the top of the Muſcles, which ſerve aptly for the moving the muſcle, being the lodging place of the animal ſpirits, belonging to the Muſcle, and out of which they iſſue into the muſcle; they are harder than the muſcles, yet ſofter than a griſtle or ligature.*

Terreſtial, *Earthly, or belonging to the Earth.*

Teſtes, *certain tubercles in the brain of a man and beaſts, ſo called becauſe like to the ſtones of a man.*

Tetaniſm, *A kind of Cramp that ſo ſtretcheth forth the member that it cannot bow nor bend any way.*

Texture, *Frame or make of a thing.*

Theorie, *Contemplation, or ſpeculative knowledge of a thing.*

Theriacal, *Or Treacle, a Medicine of a diverſe compoſition invented againſt poyſons.*

Therapeutick, *The curatory art of medicine, or that which belongs to the curing part.*

Theorem, *An Axiom reſpecting contemplation.*

Theſis, *A poſition or a general queſtion or argument to be diſcuſſed.*

Thorax, *The breaſt or the middle part of the body, reaching from the throat or neck to the lower ribs.*

Thoracious, *Belonging to the Breaſt or Thorax, or medicines good to help the diſeaſe of the Thorax.*
